THE

# ANNUAL REVIEW,

AND

*HISTORY OF LITERATURE;*

FOR 1803.

---

ARTHUR AIKIN, EDITOR. *A ref*

---

VOL. II.

---

LONDON:

PRINTED FOR T. N. LONGMAN AND O. REES, PATERNOSTER ROW;

BY T. GILLET, SALISBURY-SQUARE.

1804.

## P R E F A C E.

---

THE Editor of the Annual Review cannot allow the second volume to appear before the Public without acknowledging, in his own name and that of the Proprietors, the grateful sense entertained by them, of the encouragement which has hitherto attended their undertaking. Animated by the testimonies of approbation that have been received from various quarters, and by the extensive circulation of their first volume, they have used every exertion to render the present not unworthy of the public patronage. Its literary merit must be wholly appreciated by the reader; for, on this head the Editor feels it his duty to be silent. He may be allowed, however, to remark, that a considerable advantage has been gained with respect to the time of publication, not more than eight months and a half having elapsed since the appearance of the first volume; and it is hoped that, in future, his annual labours will terminate by the latter end of March. In addition to the obvious advantages of an arranged over a miscellaneous History of Literature, it has been almost unexpectedly discovered, that even in priority of notice the Annual Review has an advantage over any monthly one; out of nearly Five Hundred Articles, which compose the present volume, not one-third have made their appearance in any other Review of Books.

A few letters have been received from anonymous correspondents, supplying omissions in our prospective list of books, that was circulated a few months ago; and we take the present opportunity of returning our thanks for these attentions.

The monthly booksellers' lists, the advertisements in the newspapers, the catalogues in the magazines, and other periodical works, are the only public registers, from which a list of books can be collected; and as these are all confessedly imperfect, any private communications will be gratefully accepted. Those, however, which relate to our first chapter, must be sent in good time, to be of any advantage.

A. A.

*April 25, 1804.*

## CHAPTER I.—*Voyages and Travels.*

CHAPTER II.—*Theology and Ecclesiastical Affairs.*

1	Stock's Translation of Isaiah, 4to. 1l. 1s. Robinsons	—	—	111

THE  
ANNUAL REVIEW;  
AND  
*HISTORY OF LITERATURE.*

---

CHAPTER I.  
VOYAGES AND TRAVELS.

---

ON comparing the books of voyages and travels, and foreign topography, which have been published during the last year, with those that are noticed in the former volume of the Annual Review, there will be found a small increase in number, on account of the short cessation of hostilities between Great Britain and France. As soon as the treaty of Amiens was signed, multitudes of our countrymen were induced by interest and curiosity to visit a nation, doubly striking from the political changes that it had undergone, and the gigantic energies that it had displayed; in whose capital were concentrated all those luxuries and elegancies that native ingenuity could invent, or of which an unexampled series of victories could compel the surrender from Italy and Germany. Itineraries and guides, maps of the roads, and plans of Paris, were the first publications that indicated the new direction of our moveable population, which during the war had passed the summer months among the watering-places, and the mountains of Wales, Cumberland, and Scotland. The eagerness of those who remained at home to hear the remarks of their countrymen upon the state of France and its metropolis, was first gratified by the "Journal of a Party of Pleasure to Paris," noticed in our former volume: this publication was soon succeeded by others of various merit, and the number would doubtless have much increased, if the sudden recommencement of the war had not again closed the ports of France to British visitors. Among the works on this subject which fall within the limits of our present volume, the "Rough Sketch of Modern France" deserves particular distinction: the information communicated is great in quantity, and most judiciously selected; the advantages and inconveniences, the circumstances of pleasure or disgust, the vices and the virtues of modern France are stated in an able and

truly candid manner. To the visitor of Paris, it would have proved an excellent manual, and those who have missed the opportunity of personal inspection, may here obtain a correct and interesting representation of that great metropolis. Mr. Carr's "Stranger in France" is also a book of much and peculiar merit, as its author seems to have enjoyed freer access to the society of Paris than most other British travellers. Mr. Weston's Praise of Paris, and Mr. Morris's View of Modern France, are entitled to notice; the former as a light elegant sketch, and the latter as containing all that kind of information which it is essential for a traveller, a stranger, and especially an Englishman, to be acquainted with. The travels of M. Karamsin, a young Russian, have been translated into English: from Moscow he traversed Prussia and Germany to Switzerland, whence he proceeded to Paris and London. The principal objects of his attention seem to have been the manners and state of society in the various countries which he visited; but without a perfect command of the language, a long residence, and numerous introductions, it is in vain to hope for accuracy in these important, complicated, and highly interesting investigations. Mr. Muirhead has presented the public with the result of his observations on a journey through Holland, the Low Countries and part of Germany. It is a work that indicates the good sense of the author, and will be read with satisfaction by those who are not so unreasonable as to expect much novelty of description in a route that has been so long worn by the wheels of British travellers. Mr. Hunter has republished his travels, with some additional letters relative to Hungary; but they are more calculated to interest his private friends than communicate information to the scientific or general reader. The late Mr. A. Butler's journey through the Low Countries, France and Italy, in the years 1745-6, has been published, we know not why, except perhaps to inform the catholics in this country of the religious foundations established by their ancestors on the continent, and to prop up the declining reverence for relics and monastic institutions. The second volume of Professor Pallas's tours in the Crimea has made its appearance, and compleats our knowledge of this celebrated and interesting country.

Egypt being restored to its former anarchy, is no longer in a situation to excite the hopes and fears of any European state; and the two warlike nations who so lately made it the theatre of their furious contentions, are mustering their forces for nearer and more desperate enterprizes. The memory however of our Egyptian campaign has not yet lost its interest. Captain Walsh's "History of the Military Proceedings," (which, on account of its technical nature, we have referred to chap. xiv.) is a most valuable and authentic document. The author of the "Non-military Journal" sketches, with a light though faithful pencil, the principal occurrences and objects that presented themselves in the casual intervals from active service. Dr. Wittman, presuming on the indiscriminate curiosity of the public, has risked his character, by allowing his name to be prefixed to a work copied, for the most part, from Maundrel and other travellers.

Our acquaintance with Africa has not been much increased during the last year. Those, however, who read with discrimination may collect some particulars worth knowing from Dr. Winterbottom's "Account of the Settlement of Sierra Leone;" from Mr. Curtis's travels in Barbary, and the translation of M. Golbery's observations on the country about the Senegal. The

"Walks about the Cape of Good Hope" give, in a short compass, many interesting pictures of the immediate vicinity of that settlement, and of the manners of its inhabitants.

The Pelew Islands, so advantageously introduced to notice by the narrative of the late Mr. Keate, have been again visited, and have experienced the munificent gratitude of the East India Company, the particulars of which are subjoined as an appendix to a new edition of Mr. Keate's work.

But the most valuable publication, in this department of literature, which the last year can boast of, is Mr. Percival's account of the Island of Ceylon. We have seldom seen a book so uniformly excellent; every page is pregnant with information: the judicious selection of facts, the plain and unaffected language in which they are communicated, and the humane and generous spirit which breathes through the whole, are truly honourable to the abilities and principles of the author.

No modern voyages of discovery have been recorded during the last year, but two historiographers of former expeditions have offered themselves as candidates for public approbation.

Mr. Clarke has undertaken, with dubious success, to illustrate the expeditions of the Portuguese on the coast of Africa and the East Indies; and Captain Burney has commenced, with more favourable auspices, a History of the Discoveries in the South Sea.

ART. I. *A Chronological History of the Discoveries, in the South Sea or Pacific Ocean. Part I. Commencing with an Account of the earliest Discovery of that Sea by Europeans, and terminating with the Voyage of SIR FRANCIS DRAKE, in 1579. Illustrated with Charts. By JAMES BURNLEY, Captain in the Royal Navy. 4to. pages about 400.*

THE plan and object of this work are explained by the author in a dedication to Sir Joseph Banks: "it is intended as a contribution towards the advancement of a plan for the digest of maritime geographical discovery; a work which has long been wanted, and which every addition to the general stock, renders more necessary."

"The utility of method and compression, to prevent irregular exuberance in so important a branch of science, is evident beyond contradiction. The manner in which the attempt may be made with the best prospect of success, seems the only object of enquiry. Various modes of reducing the voyages into methodical order present themselves; and probably each so far eligible as to possess some peculiar advantage.

"To place the whole in the order of time, would be attended with this great inconvenience, that to obtain a satisfactory account of any one subject, it might be requisite to consult every volume in the collection, however extensive.

"To distinguish the discoveries of different nations, making a distinct class of the

voyages of each, is liable to the same objection.

"A third method, which seems to me to possess many, if not the greatest advantages, is that of classing the voyages according to some hydrographical division of the globe. This has been attempted, but in few instances with any tolerable degree of success. If the divisions have been judiciously allotted, they have not been strictly preserved. The same irregularity has prevailed in collections which consist wholly of republications, where it is difficult to imagine that any good reason could exist against an adherence to correct arrangement.

"It is not to be supposed that any mode of arranging the subject could be devised, which would obviate every inconvenience. The following division is proposed as one which appears capable of preserving its classes in a great measure distinct from each other.

"The first class may contain the voyages to the north of Europe; those in the North Seas, and towards the North Pole.

"The second, those along the West coast of Africa to the Cape of Good Hope; and the discoveries of the Atlantic islands.

"The third, East from the Cape of Good

Hope to China, including the Eastern Archipelagos between New Holland and the coast of China. Japan might have a section to itself as a supplement to this class.

"The fourth might contain the whole of the discovery of the East side of America, except the Strait of Magalhães and of Le Maire, which are more connected with the voyages to the South Sea.

"The fifth class may comprehend the circumnavigations and voyages to the South Sea. With these, the discoveries on the West coast of North America are so much interwoven, that they cannot without disadvantage, be separated.

"The discoveries made by the Russians in the seas near Kamtschatka, and from thence to the North, would appear not improperly as a supplement to the fifth class.

"New Holland might form a sixth class. This country would naturally have divided itself between the third and fifth, had not its importance so much increased within the few last years, that it now requires a distinct class to itself.

"For the subject of the present work, I have chosen the discoveries made in the South Sea, to which my attention has been principally directed, from having sailed with that great discoverer and excellent navigator, the late Captain Cook; under whose command I served as Lieutenant in his two last voyages."

Upon this plan Captain Burney has condensed into one volume, the history of the discoveries in the South Sea, from the time when it was first known to Europeans, to the voyage of Sir Francis Drake.

*Nec mole dum decrescit, usu fit minor,  
Quin auctor jam evadit, & cumulatus  
Contracta prodest erudita pagina.  
Sic ubere magis liquor e presso effluit;  
Sic pleniori vasa inundat sanguinis  
Torrente cordis Systole; sic fusius  
Procurrit æquor ex Abylæ angustis.*

Three centuries ago the whole of the Pacific Ocean, and even its existence, was unknown to Europeans; the geographers of that time believed that one open sea extended from the western shores of Europe and Africa, to the eastern part of Asia. Upon this error Columbus proceeded; mistaken as the Portuguese were in their estimate of the talents of the adventurer, perhaps the greatest man and the most blameless whom modern times have produced, their reason for rejecting his offered services was well founded, and actually in consequence of their superior science; he proposed to reach Japan, the Cypango of Marco Paolo, by sailing westward. Joam II. referred his project to the Bishop

of Ceuta, Mestre Rodrigo and Mestre Josepe his cosmographers, and they with good reason pronounced it impracticable; they affirmed that they were seeking India in the true direction, and they were right. Columbus persevered, and his discoveries received the name of India from his accredited error. When it had been ascertained that America was not a part of Asia, its extent was not supposed to be such as to obstruct a western passage to the eastern Indies. At the very time when Vasco da Gama was on his voyage, the two Cabots sailed from England, in quest of a way to the north of the Spanish discoveries. In 1500 Gaspar Corte-Real sailed from Lisbon or the Azores in the track of the Cabots: he discovered the Labrador coast, and sailing a second time to prosecute his discovery, was heard of no more. His brother Miguel sailed with two ships in search of him, and they also were lost. King Emanuel, who was attached to the brethren, for they had been brought up in his household, sent out two vessels to seek them, but no tidings were ever obtained; the province which they had discovered and called Terra Verde, was called, in remembrance of them, Terra dos Corte-Reaes. The third brother, Vasco Eannes, would have followed in their search, but Emanuel forbade him, being now warned by experience.

The first Europeans who saw the main land of America were the English under Cabot, but the whole glory is due to Columbus. It has been idly regretted that Americus Vespucius should have affixed his name to the new world, as if any real honor had accrued to him from the success of his falsehood. When America is named, who thinks of its derivation from Americus or Amerigo, or Aymerique? Next to the bible, no history is so generally known as the voyages of Columbus: Vespucius is now never mentioned but to be censured; by perpetuating his name, he has only obtained a perpetuity of disgrace.

In a chart printed at Rome 1508, Brazil, or Terra de Santa Cruz, as it was then called, is delineated as being separate from the northern continent. But now every year furnished new discoveries, for never at any period was the human race so persevering and desperate in enterprise. The Europeans were certain that a sea existed to the west of the new continent, because they knew that the eastern parts of China were

washed by the ocean; but the first actual information of this sea which they obtained,

"Was given to the Spanish conquerors by the native Americans. Basco Nunnez de Balboa, a Spanish commander at Darien, to verify the intelligence he had received, marched with a body of Spaniards, and with Indian guides, across the isthmus. He was opposed in the passage by the natives. They demanded who the bearded strangers were, what they sought after, and whither they were going? The Spaniards answered, 'they were christians, that their errand was to preach a new religion, and to seek gold; and that they were going to the southern sea.' This answer not giving satisfaction, Balboa forcibly made his way. On arriving at the foot of a mountain, from the top of which he was informed that the sea he so anxiously wished to discover was visible; he ordered his men to halt, and ascended alone. As soon as he had attained the summit, he fell on his knees, and with uplifted hands returned thanks to heaven, for having bestowed on him the honour of being the first European that beheld the sea beyond America. Afterwards, in the presence of his followers, and of many Indians, he walked up to his middle in the water, with his sword and target; and called on them to bear testimony that he took possession of the South Sea, and all which appertained to it, for the King of Castile and Leon.

"The particular position of the coast of that part of the American continent from whence the sea on the other side was first discovered, appears to have stamped on it the denomination of the South Sea. The isthmus of Darien lies nearly east and west; consequently, there the two seas appear situated, the one to the north, and the other to the south. If the new sea had been first discovered from any part to the south of the bay of Panama, it would probably have received some other appellation. A consequence resulting from the name thus imposed has been, that the Atlantic ocean, by way of contra-distinction, has occasionally been called the North Sea, even in its most southern part."

Only two years after this discovery the court of Spain sent Juan Diaz de Solis to explore the southern coast of America, and seek out a passage into the South Sea and to the Spice Islands. Juan Diaz was one of the most able navigators of his time; but he was slain by the natives near the Rio de la Plata, and upon his death the remainder of his people returned. The next expedition was under the command of Fernam de Magalhaens. Captain Burney we believe is mistaken in the orthography of this name; he says,

"The Spanish authors call him *Magalanes*, and generally with the christian name *Hernando*. *Galvaom*, *De Barros*, and others of his countrymen, write the name *Fernando de Magalhanes*, and this orthography has been adopted by Mr. Dalrymple. The strange practice (for it is one of those which custom cannot familiarise) of translating proper names, even when composed of words which have no descriptive or second meaning, has not been neglected in that of *Magalhanes*. In Spanish it is *Magallanes*; in Italian, *Mugaghanes*; and the English of *Magalhanes* has been *Magellan*."

In the last edition of Barros the name is spelt *Fernão de Magalhães*, which the Portuguese, when they disuse the til, write *Fernam de Magalhaens*. When they call him *Magalhanes*, they represent the sound of his Spanish name in Portuguese orthography, *Castilianizing* it, as he expatriated himself. Captain Burney is so very accurate a writer, that we are sure he will be pleased to see the minutest errors of his volume pointed out. He should write *Galvam*, not *Galvaom*, *Barros*, or *Joam de Barros*, never *De Barros*.

"Fernando de Magalhanes, by birth a Portuguese, and of a good family, who had served five years with reputation in the East Indies, under the celebrated Albuquerque, thinking his services ill requited by the court of Portugal, banished himself from his native land, and solicited employment from the king of Spain. He was accompanied by one of his countrymen, Ruy Falero, who was esteemed to be a good astronomer and geographer. They offered to prove that the Molucca islands fell within the limits assigned by the pope to the crown of Castile, and undertook to discover a passage thither, different from the one used by the Portuguese. It is said that they first presented their plan to Emanuel, king of Portugal, who rejected it with displeasure; probably, being of opinion that it would be prejudicial to the interests of the Portuguese, who were then quietly suffered by the rest of Europe to possess exclusively the advantages of the East Indian navigation, to encourage the discovery of a new route to those seas. An enterprize of such a nature, undertaken by one of their countrymen, for the benefit of foreigners, must naturally have excited great indignation in the Portuguese; and to this sentiment may be attributed several anecdotes which the writers of that nation have related to the disadvantage of Magalhanes."

The Portuguese accuse him of peculation; that when a large booty had been made from the Moors in Africa, he and one Alvaro Monteiro who kept the

watch, sold four hundred head of the cattle whom they had taken, back again to the Moors; and when they had been safely driven off, gave the alarm that they were stolen. The circumstances of this knavery are singular, but the crime has been common. Cortes plundered his own soldiers, and the history of prize money, from the first conquest in the West Indies to the last, seems to contradict a common adage. Ruy Falero's character has been defamed with less appearance of reason; they say he knew nothing of astrology, astronomy, or geography, and that whatever came from him upon these sciences was by the help of a familiar spirit. Ruy Falero wanted to bring the Moluccas on the Spanish side of the line of demarcation. If the devil had any thing to do with that line, it must have been that he was concerned with the Pope in drawing it; a geographical dispute may be carried on without his assistance. But whatever may have been the former crimes of Magalhaens and Falero, it is certain that in this project they acted as enemies to their own country, and the ineffaceable blot must remain upon them.

"There yet exist accounts of the navigation of Magalhaens that have not been published. In *Biblioth. Pinelo de Leon*, two manuscripts are mentioned under the title of *Navegacion de Magallanes*; one of them with the name of Duarte de Resendi, at one time governor or agent for the Portuguese at the Moluccas (*Factor de las Malucas*) of whom Argensola says, that he was 'a curious man,' and that he preserved likewise the papers of Andres de San Martin."

These papers of the unfortunate astrologer, Andres de San Martin, were given by Duarte de Rezende to the historian Barros; he says that the observations were purposely falsified by Andres to favour the Spanish claim; this circumstance was confessed by one of the crew, who died afterward on his way to India in a Portuguese vessel. Barros calls this man Bustamente, and the name appears in Herrera's list of the eighteen Europeans who returned. It is certain that Rezende wrote an account of the voyage and dedicated it to Barros, who was his kinsman. This manuscript, if it could be recovered, would probably be very valuable.

On the 20th of September 1519, Magalhaens sailed from San Lucar, with a squadron of five ships and 236 men; he had scarcely passed Teneriffe before his

officers began to murmur at the course he held. At Rio Janeiro they purchased provisions, &c. for slaves; it was then a cheaper market than it is now, for the natives gave six fowls for the king out of a pack of cards, and thought they had made a good bargain. It was Easter before they reached a port which they called San Julian, in latitude 49° 18' south; here the commander determined to pass the winter season; his people wanted to return: the traitor is never trusted; they argued that Magalhaens wished to purchase his pardon from the king of Portugal by destroying a Spanish fleet. Nothing could be more absurd than such a supposition, but there is no absurdity which, if it heightens fear, the fearful will not believe. The officers deeply hated their general; thinking it was a disgrace that Spaniards should be commanded by a Portuguese. The manners of Magalhaens were ill calculated to conciliate their hostile spirits, he was a resolute and even headstrong man, conscious of his natural superiority, and provoked to the full exercise of his power by the thwartings of envy and mutinous pride. Three of his captains conspired against him; he possessed the confidence of the inferior officers and seamen, among whom were several of his country, and lost no time in quelling these enemies. On board the one ship he sent a man with a letter to the captain, and a dagger to stab him while reading it; this assassination restored his authority there. He boarded the second ship and secured the mutineers, and then the third submitted. One of the captains was hung and quartered, the other set on shore with a French priest and left there. While Magalhaens remained here, one of his ships was wrecked, in an attempt to explore the coast; the crew was however saved.

"The fleet had lain two months in Port San Julian, without any natives having been seen. One day, when it was least expected, a man, of a gigantic figure, appeared on the beach nearest the ships. He was almost naked: he sung and danced, at the same time sprinkling dust upon his head. A seaman was set on shore, with orders to make gestures similar to those of the Indian; intended for signals of amity, which was so well performed and comprehended, that the 'giant' accompanied him to the captain general. He pointed to the sky, as if to enquire whether the Spaniards had descended from above. The object which most astonished him, was his own figure in a looking-glass; at the first

sight of which he started back so suddenly as to overturn four Spaniards who were behind him. "This man," says Pigafetta, "was so tall that our heads scarcely came up to his waist, and his voice was like that of a bull." More of the natives shewed themselves on the shore near the ships, making signs that they wished to come on board; and, says a Spanish author, "greatly marvelling to see such large ships, and such little men." A boat was sent, and they were taken to the Capitana. The description given by Herrera of the size of these people, has more the appearance of truth than that given by Pigafetta. Herrera says, the least of the men was larger and taller than the stoutest man of Castile. They had bows and arrows, and were clothed in clokes made of the skins of some animal neatly sewed together. A kettle of pottage was made with biscuit for them, sufficient to have satisfied twenty Spaniards, which six Indians entirely eat up. When they had finished their meal, and satisfied their curiosity, they desired to go, and a boat carried them to the shore.

"The next day, two of the natives brought some venison (which was the flesh of the animal whose skin served them for clothing). In return they received each a present of a red jacket, with which they were much pleased. The day after, one of the Indians brought more venison. The same man visited them several days following. He was taught to pronounce the Lord's prayer, and at length was christened by the name of Juan Gigante."

English sailors would certainly have christened this man Little John, or rather indeed have given him the name without the ceremony. The account of this interview in Harris has many circumstances not to be found in Captain Burney; we transcribe it on this account, and also because it is an admirable specimen of narrative, such as our forefathers wrote, when men regarded what they were to write, and not how they should write it.

"At last to put an end to the solitude, a certain giant of the neighbouring parts came up to give them a visit; a brisk, jolly, frolicsome fellow, very merrily disposed, singing and dancing all the way as he came. Being got to the haven, he stood there and threw dust upon his head; which they observing sent some ashore to him, who making the like signs of peace, upon that assurance he came along with them to the ship, without any thing of fear or scruple. His bulk and stature was such as would easily allow him the character of a giant; the head of one of their middle-sized men reached but to his waist, and he was proportionably big. His

body was formidably painted all over, especially his face; there were a couple of stags drawn, one upon each cheek, and great red circles about his eyes, his colours were otherwise mostly yellow, only his hair was done with white.

"For his apparel, he had the skin of a certain beast, clumsily sewed together; but a beast as strange as that was that wore it; every way unaccountable, neither mule, horse, nor camel, but something of every one, the ears of the first, the tail of the second, and the shape and body of the last. 'Twas an entire suit, all of one piece from head to foot; as his breast and back were covered with it above, so his very legs and feet were wrapped up in the same beneath. The arms that he brought with him were a stout bow and arrows; the string of the former was a gut, or sinew, of that monstrous beast, and the latter instead of iron heads, were tipped with sharp stones.

"The admiral made him eat and drink, and he enjoyed himself very comfortably a shipboard, till he happened to peep in a great looking-glass that was given him among other trifles. This put him into a fright that he could not easily recover from: the dismal face he saw there, started him quite out of all countenance and courage, and he started back with such violence, that he tumbled a couple of the men that stood by him to the ground. This was a sign that he was thoroughly and effectually frightened; but no doubt, the thing that appeared to him, will be thought sufficient to do it, if the foregoing description be well considered. A pair of great stags with branched horns and the flaming circles drawn about the eyes: what hobgoblin could have a worse look than this? a dæmon's face in a vizard mask, with a set of long teeth, and a nose of half a yard, could not have more power over the imagination, and give a man a worse shock of a sudden, than such a sight."

It is remarkable that so many circumstances should appear in this account, which are not noticed in the volume before us, for Captain Burney is in general so excellently minute that he leaves nothing to be gleaned from his documents. Harris's narrative is "taken out of Anthony Pigafetta," of course either from the abridged translation made by order of Louisa of Savoy, or from the version in Ramusio. The present author has followed the copy lately discovered

in the Ambrosian library, and being reasonably satisfied with the fullest and most authentic copy, did not think it necessary to examine an abridgment. But it is very probable that Pigafetta's original manuscripts differed from each other, that in writing one he recollected particulars which he had forgotten, or from haste or indolence had omitted in another, and that thus the abridgment of one copy may supply what is wanting in the entire text of another.

The conduct of the Spaniards to these unoffending people was truly abominable. "They filled their hands with toys and little things that pleased them, and in the mean-time put iron shackles upon their legs, which the wretches thought were very fine play-things as well as the rest, and were pleased with the jingling sound of them, till they found how they were hampered and betrayed." Pigafetta says they worshipped the devil; the Patagonians had more reason to say the same of their visitors, judging them by their works.

Toward the latter end of October they came to the Cape called De las Virgines, in honour of the eleven thousand companions of Saint Ursula, on whose festival they had discovered it. On examining the strait, little doubt remained that it would lead them to the South Sea; but it appeared on enquiry that they had only provisions enough for three months left: upon this Magalhaens summoned a council. One of his pilots voted for returning to Spain, the majority were for proceeding, and the commander himself affirmed, that, were it even certain they should be reduced to the necessity of eating the hides that were on the ships yards, his determination was to proceed and make good his promises to the emperor. He then gave orders that no one, on pain of death, should speak of returning, or of the shortness of provisions.

The account given by Joam de Barros differs materially from this. Captain Burney has not noticed it; it is however drawn from such documents as entitle it to credit. He says, that, after one of the ships had deserted (an event which the other histories represent as subsequent to the council), Magalhaens, knowing that the greater part of his people were hostile to him and his plans, was exceedingly perplexed. For his own justification he was obliged to ask

the opinion of his officers, and yet feared to call a council, lest they should break out into mutiny. He therefore sent a written paper to the two other ships, requiring the written opinion of the officers in reply. Barros affirms that he had a book in his possession, in which Andres de San Martin, the astrologer and cosmographer of the voyage, had entered this paper and his own reply to it, and he gives both at length. In this Magalhaens says, that he is a man who never rejected advice, though since the mutiny at Port San Julian they had all been afraid to declare their opinions; that he knew they thought it wrong to proceed, but he commanded them in the name of the emperor, and by virtue of his own authority, each to give him his written opinion whether to advance or return, and the reasons for such conclusion. San Martin in his answer advises the commander to go on till the middle of January, for though he himself doubts whether they should find a passage to India through that strait, still they were bound to examine it. After that time he thought they should return, because of the terribleness and tempestuousness (*terribilidade e tempestuosidade*) of the seasons, the sickly condition of the crew, and the scarcity of food. Andres also recommends that during the five hours of darkness they should lie to, for the sake of avoiding danger and of giving the men some rest. These papers are dated November 22. On the 27th they found themselves in an open sea, and Magalhaens is said to have wept for joy at the discovery.

The adventurers now suffered dreadfully in their voyage. Magalhaens was reduced to that extremity of hunger which he had declared himself ready to endure; they actually were compelled to eat the leather from off the rigging, to swallow saw-dust, and to mix sea water with their fresh. Twenty men died of the scurvy. Happily the weather continued so uniformly mild that they gave the sea its appellation of the Pacific: for it appears peculiarly unfortunate, that in crossing so large an expanse of sea, in which so many fruitful islands are numerously scattered, they should see only two solitary and desert islands, so destitute of any thing to relieve them, that they named them Las Desventuradas, the Unfortunate. Captain Burney conceives that they passed very near Otaheite.

On the sixth of March they came in

sight of the Ladrões, so named by them on account of the thievish disposition of the inhabitants. When the Spaniards landed to chastise them, the sick requested, if any of them should be killed, to have their intestines, which they were persuaded would cure them in a short time. Pigafetta, who records this circumstance, has not explained how the medicine was to have been administered. It may perhaps be elucidated by a fact repeatedly mentioned in Bernal Diaz. The wounded Spaniards in Mexico for want of oil, used to melt the fat of the Indians and cauterize their wounds therewith. Boiling oil was the remedy for gun-shot wounds, at a much later period, upon the hypothesis that it killed the venom of the wound. It is probable that the Spaniards with Magalhaens designed to apply the same medicine to their scorbutic sores. Why human fat should have been preferred to any other animal grease does not immediately appear, but that the preference was given to it is evident from the facts in Bernal Diaz.

They next reached the archipelago of St. Lazarus, now called the Philippines. Here the inhabitants appear to have united the customs of Hindostan and the South Sea Islands, chewing betel and areca, and tattowing their bodies. Several of the Indian languages were understood at Mazagua, believed to be the island marked Limasava in some of the present charts. A Sumatran slave on board was able to interpret. The Rajah is said to have had each tooth ornamented with three spots of gold. To impress him and his people with a dread of European superiority, a Spaniard in complete armour made his appearance, who sustained the attack of three men, their swords and daggers not making the slightest impression. From hence Magalhaens sailed to Zebu, where with little difficulty he converted the king and queen.

“The new christians were regular in their attendance at the chapel, and the number of proselytes daily increased by the arrival of people from other parts of the island, as well as from other islands, who desired to be baptized. Magalhaens was careful to explain to the King of Zebu, if not the duties required, the many benefits that would accrue to him in becoming a christian; one amongst which, he assured him, would be the power of vanquishing with ease his enemies. The desire of possessing such an ad-

vantage, a motive very distant indeed from the spirit of christianity, appears to have been a strong inducement with the king to attach himself with zeal to a religion he was so little able to comprehend. Trusting to the promises of Magalhaens, that he should be rendered the most powerful among the princes of the islands, he acknowledged himself to be a vassal of the crown of Spain. The general, to prove to him the value of the friendship of the Spaniards, and how much it was his interest to continue firm in his allegiance, summoned a meeting of the other chiefs, four of whom attended. These were required formally to submit themselves to the new christian king as their sovereign, and threatened that their refusal to obey him as such, would be punished with death, and confiscation of their possessions. This menace drew from all the chiefs the promise demanded of obedience, and a full acknowledgment of the authority of the christian king. But two of the chiefs, as soon as they were more at liberty, made light of the command. Against one of these the general went with two boats and forty of his men: and coming up with him in the middle of the night, plundered and burnt one of his villages, and set up a cross there.”

This spirit of aggression found its merited reward. Magalhaens sent to the king of Matan, a little island near Zebu, to claim tribute for the emperor, and submission to his friend the christian king. The chief of Matan being a brave man, replied that he desired to be on good terms with the strangers, and sent them a present of provisions that he might not be accounted inhospitable; but as to obedience and tribute, he could owe none to those of whom he had never before heard, neither would he submit to do reverence to those he had long been accustomed to command. Magalhaens, notwithstanding the dissuasions of the king of Zebu, and of Serrano one of his own officers, determined to go and punish this contumacy. He landed with about fifty men, being so fully persuaded that no number of Indians could withstand that European force, that he ordered the christian king to remain quietly with his people in their boats, and see how the Spaniards fought. A kind of missive battle took place during the greater part of the day, till

“At length, the ammunition of the Spaniards began to fail, and their fire slackened, which being observed by the islanders, they pressed on, and Magalhaens found it necessary to order a retreat. The christian king, during the whole of this time, had paid the most exact obedience to the commands he had re-

ceived from the general; he and his men looking quietly at what was passing, without moving from their canoes. Early in the retreat, Magalhães was wounded in the leg by an arrow; his person being known to the Indians, their efforts were principally directed against him. The boats were still at a distance, the shore being flat and rocky; and many of the Spaniards, instead of making an orderly retreat, hastened towards them with precipitation. The helmet of Magalhães was twice beaten off with stones; his right arm being wounded, he could not use his sword; and being closely pressed on by multitudes, he was brought to the ground. When he was down, an Indian killed him with a lance."

The king of Zebu now determined to make his peace with the chiefs whom he had offended, by sacrificing the Spaniards who had encouraged him to acts of ambitious aggression. He invited the two new commanders and officers to an entertainment ashore, that they might receive the presents designed for the emperor; they went, and were all murdered at the banquet, except Serrano, who was much in favour with the Indians. Him they led down, manacled and naked, to the shore, for the ships had begun to fire upon the town. He begged his countrymen to desist from firing, for his sake, and intreated to be ransomed, the Indians demanding two pieces of ordnance for his release. Carvallo, who was the principal officer remaining, affected to apprehend farther treachery, hoisted sail and fled, leaving Serrano to their mercy: from his cries, which were heard on board, it was believed that he was immediately put to death. Carvallo acted this base and cowardly part, because he expected to be chosen commander in chief, as in fact he was.

Their number was now reduced to 115 men, too small a company for the management and defence of three ships, the oldest was therefore burnt. At the different islands whereby they passed they enquired for Borneo, knowing that there they should obtain notice of the Moluccas. They reached this island in July.

Here also the Spaniards were treacherously treated, not from any misconduct of their own, but from that justifiable hostility with which all the Asiatics regarded Europeans, after the arrival of Vasco da Gama in India. Three of their little company were made prisoners, and by some unaccountable mismanagement were left in the king of Borneo's

power, though the Spaniards in reprisal carried away nineteen of his subjects.

In November they reached Tidore, thus accomplishing their outward voyage. Here they formed alliances with the native kings, which occasioned many an after dispute with the Portuguese, and here they took in a cargo of spices. As they were departing the *Trinidad* sprung a leak; the king of Tidore sent divers to examine her bottom, they dived with their long hair loose, because they imagined that the water entering the ship would draw the hair to that part and indicate the place of the leak. It was found necessary to careen her, and as this would be a work of time, it was determined that the *Vitoria* should proceed without delay to Europe by the Cape of Good Hope. On their homeward voyage they found at Mallua a people, "more resembling brute beasts than men;" so they are described, yet the absurdity of their fashions is peculiar to humanity: before and behind they wore pieces of goats-skin made into the form of tails; they wrapped their beards up in leaves and kept them enveloped in reed-cases. A Molucca pilot told them of a stranger race whose ears were so long, that one served the purpose of a mattress to sleep on, and the other for a coverlid. It must have been amusing to see one of these gentlemen take up his bed and walk. They suffered severely on their passage, losing in all 21 men. We observed, says Pigafetta, when the dead bodies were cast into the sea, that the christians descended always with their faces toward heaven, and the Indians with their faces downwards.

On the sixth of September 1522 the *Vitoria* arrived at San Lucar, the number of Europeans remaining in her being only eighteen. Magalhaens had sailed from the same port with five ships and 236 men. Three years within fourteen days were employed in this voyage, which Captain Burney well calls, "one of the most extraordinary and eventful that has ever been undertaken, a voyage so forcibly conveying those impressions which can only be communicated by a first discovery, that it will always be contemplated with interest. While the advancement of science shall continue to interest mankind, Magalhaens, whose enterprize and perseverance first practically demonstrated the form of our planet, will be remembered with admira-

tion and gratitude." On this account we have been particular in our examination, and also because so accurate and scientific a history of this most important expedition has never before been presented to the public.

The second expedition, by the same course, under Garcia Jofre de Loyasa, was still more unfortunate than the first. The Straits of Magalhaens were then neglected for so many years, that there was a saying that the passage had closed up. The many unfortunate expeditions to the Pacific created a superstitious prejudice against the discovery, and it was asserted that a judgment had fallen upon all who were principally concerned in it. Vasco Nunez de Balboa, the first who saw the South Sea, was beheaded. Magalhaens was killed by pagans, Ruy Falero died raving, and De Lepe, the sailor who first discovered the strait from the top-mast, turned renegade, and so perished eternally for a Mahommedan. But though this course was for a while abandoned, the South Sea was explored with ability and perseverance, from Panama and the other Spanish settlements on that coast. California was discovered by Cortes, and its gulph examined. The discoveries to the north of Mexico, the expeditions to the Philippines, the discovery of the Salomon Island, and the various smaller groupes or single isles are detailed accurately and scientifically. Captain Burney examines the reports concerning the discovery of a southern continent; they exhibit, he says, a curious mixture of the probable and the fabulous, and he thinks that if any such land was seen by Juan Fernandez, it must have been New Zealand.

The voyage of Sir Francis Drake is the last event related in this volume. It would exceed our limits to follow the author through this interesting detail; its conclusion we will copy, in honour to our great navigator, who while he possessed skill and perseverance equal to what Magalhaens displayed, discovers, by his humanity as well as his courage, a true English heart.

"The conduct of Drake in this expedition is, in many particulars, highly to be extolled. Among the commendations which are due to him, the humanity with which he treated the natives of uncivilized countries is not the least. To strangers in general his behaviour was affable and hospitable: towards the Indians, his forbearance, and the various instances of his kindness, were the spontane-

ous effects of genuine good will. He has been censured for ignorance as a navigator; but there is no evidence to establish such a charge, and much to refute it. A Spanish writer says, that his ignorance is fully manifested in the scarcity of information which appears in his journal: This can only have been said from misapprehension, in attributing to him the defects of others. The accounts published of his voyage, it is true, are as erroneous and defective in the geographical particulars, as those of any of the early navigations: but none of these accounts were written by Drake. The purposes of discovery, or the advancement of science, were not among the motives of his voyage. Whatever journal or account he kept himself, the doubtful complexion of his undertaking would render him more solicitous to conceal than to make public. In the attachment of his people towards him, is evinced the full confidence they placed in his abilities: and among those who most censured his expedition, he is praised 'for conducting it so discreetly, patiently, and resolutely:' and certainly, whatsoever may be said of his undertaking, the character of his abilities may be pronounced superior to attack. It is said of Drake, that he was a willing hearer of every man's opinion, but commonly a follower of his own. If he had not been a well qualified navigator, as well as an expert mariner, it is not to be imagined that he would have projected, and, being under no controul of orders from any superior, would have attempted the execution of so arduous a plan as the seeking for a passage, from the Pacific Ocean to the Atlantic Ocean, by the North of America: upon which attempt, it is justly observed in the Biographia Britannica, that 'his coasting North America to the height of 48 degrees, and endeavouring on that side to find a passage back into our sea, is the strongest proof of his consummate skill and invincible courage.'

The fine old epigram upon Sir Francis Drake has not been omitted by this author:

*Si taceant homines, facient te sidera notum,  
Sol nescit comitis non memor esse sui.*

The Stars above will make thee known  
If men were silent here,  
The Sun himself cannot forget  
His fellow traveller,

Old Owen the epigrammatist has one of his mongrel conceits upon the same worthy,

*Ambitio Draki nullo reticebitur ævo,  
Ambivit Terras per mare Drakus Anas.*

There is a still quainter conceit which has somewhat strangely escaped Captain Burney's notice, though his volume evinces a

genuine taste for the oddities of our excellent old writers.

O Nature to Old England still  
Continue these mistakes,  
Give us for our Kings such Queens  
And for our *Dux* such Drakes.

The volume concludes with an account of the charts belonging to it, and observations on the geography of the 16th century. An appendix is added, containing remarks on the projection of charts, and the degree of curvature proper to be given to the parallels of latitude.

ART. II. *The Progress of Maritime Discovery, from the Earliest Period to the Close of the Eighteenth Century: forming an extensive System of Hydrography.* By JAMES STANIER CLARKE, F. R. S. Domestic Chaplain to the Prince. Vol. I. 4to. 980 pages, 13 plates and 5 maps.

FROM the preface to this bulky volume we copy Mr. Clarke's account of his work:

"The introduction to this volume will be found to contain a progressive memoir of maritime discoveries by the Cuthites, and Phenicians, the Greeks, Carthaginians, and Romans. The work itself, after some illustrations of commercial history, in which, among other subjects, the doubtful progress of the Norman mariners is glanced at, proceeds to review the early periods of Portuguese history prior to the fifteenth century; an account is then given of their most distinguished writers on Portuguese Asia and America; and the history of their discoveries follows, from the reign of John the first in 1385, to the arrival of da Gama in 1498 on the coast of Malabar; which completes the first great division of my labours. In the appendix are many curious and scarce tracts respecting navigation, which are intended to elucidate the preceding pages."

Mr. Clarke's introduction fills 230 quarto pages; he entitles it an historical memoir of ancient maritime discoveries. This is altogether a work of supererogation; the ancient discoveries are fit subjects for curious enquiry, for antiquarian research: but the dissertation here is misplaced. Whatever they may have been; they were forgotten; they have no more connection with modern discoveries than the history of the Roman republic with the history of the popes.

This memoir commences with a long discourse, for which a text may be found in old Thomas Fuller: "Was not God the first shipwright? and all vessels in the water descended from the loins, or rather ribs, of Noah's Ark? or else who durst be so bold with a few crooked

We consider this work as a very valuable addition to our maritime history. To execute it well required extensive knowledge, diligent research, and great professional skill, and these rare requisites the author evidently possesses. There is nothing superfluous in the volume; whatever is not generally interesting, is either necessary to historical precision, or to practical science. The remaining parts of the work we may reasonably expect to rise in value and in interest, when Captain Burney comes to relate what he himself has seen.

boards nailed together, a stick standing upright, and a rag tied to it, to adventure into the ocean?" The discourse thus opens:

"Imagination has delighted to trace the origin of navigation from the instinct of boyant Nautili, or the appearance of a floating oak, which amidst the sudden ravages of inundation supported the animal that had reposed beneath its shade. The celebrated fragment of Sanchoniatho the Phenician, which Eusebius has preserved, declares that Ousous one of his country, was the first that formed a canoe from a tree half consumed by fire: but the more enlightened historian will desist from the accustomed repetition of Pagan fables, and refer his readers to more sublime and authentic records. He will recal to their attention that stupendous act of divine mercy and immutable justice, by which the human race was punished and preserved; by which the earth was purified throughout its most distant extent: he will affirm, and appeal to heaven for the truth of his opinion, that the great archetype of navigation was the ark of Noah, constructed by divine direction.

"The pagan sage ignorant of that sacred history, was urged by an unpardonable impulse of vanity, to augment the obscurity which time and apostacy had cast over the earliest ages: he therefore assigned with no sparing hand to his own nation, whatever tended to give an idea of high antiquity to its annals; and employed the scattered events of postdiluvian history, as fair spoil, to enrich the splendid tissue of his own narration. Even the insigne of the triads of God, which eastern superstition had distinguished as the trident of the Indian Seeva, was given by a strange infatuation to the Pagan Neptune; whose throne is described as placed in that abyss, which had been employed to destroy the impiety of preceding ages.

"The plausible tale of Grecian mythology being once fabricated, was continued

and adorned by succeeding generations. The great masters of history even in our own times have confused themselves and their readers, by referring the important events of the earliest periods, to Osiris and Sesostri, to the Argonauts and Hercules: when at length a sage appeared, who arrested the progress of fable, and vindicated the cause of truth.—The fame of the venerable Bryant needs no eulogium, but enjoys an elevation which succeeding centuries will support. By pointing out a path which all preceding writers had neglected, he recalled his countrymen from the legends of that mythology which had disgraced their writings. Admired and abused, imitated and blamed, Mr. Bryant has preserved the even tenour of his course, and given a new impulse to the literary world."

When the blind lead the blind it is no marvel that they go astray. Mr. Clarke has chosen Jacob Bryant for his guide in antient history; he calls him a *judicious sceptic*, and says that the scarcity of his valuable work will excuse long and frequent citations. Mr. Maurice is another of the author's oracles, but he seems to be unacquainted with the writings of General Vallancey, the great master of the erudite and the confused. He himself partakes the *judicious scepticism* of his school, which consists in disbelieving whatever thwarts their own hypotheses, and quoting the most absurd legends of the most suspicious writers with full faith.

"M. Bailli, in his history of astronomy, after describing its connection with agriculture, chronology, geography, and navigation, takes a general view of the inventors and origin of this science; and, in his third book, considers the state of astronomy before the flood. He scruples not to assign a knowledge of the mariner's compass, and of the clepsydra, to the antediluvians; and also seems inclined to add the use of the pendulum. Mr. Maurice, with considerable ingenuity, supports the same opinion in his valuable history of Hindostan; and after invalidating many of the extravagant and dogmatical assertions of M. Bailli, introduces a sketch of such arts and sciences as may reasonably, and without exaggeration, be presumed to have been cultivated by mankind before the flood. Though Mr. Mau-

rice does not particularly contend for the existence of an antediluvian sphere, he expatiates on the probability of many invaluable astronomical records having been preserved by Noah, among the remains of the wisdom of the antient world; and cites the few passages in profane history, from Josephus, Manetho, and Diodorus Siculus, that seem to illustrate this opinion. But the most curious attestation of this occurs in the oriental philosophy of Mr. Stanley, who gleaned it from the old Chaldean and Arabian authors. Kissæus, a Mahomedan writer, asserts that the Sabians possessed not only the books of Seth and Edris, but also others written by Adam himself; for Abraham, after his expulsion from Chaldea by the tyrant Nimrod, going into the country of the Sabians, opened the chest of Adam; and, behold, in it were the books of Adam, as also those of Seth and Edris; and the names of all the prophets that were to succeed Abraham."

Who can doubt the astronomical knowledge of the antediluvians? nay, who does not hope to see an edition of the works of Adam printed from the original manuscript, after this attestation of the learned Kissæus? But Mr. Clarke does not bow in passive obedience to the authority of his worthy predecessors; he cannot believe, notwithstanding the authority of M. Bailli and Mr. Maurice, that the magnet was discovered previous to the flood: for "this," says he, "would argue a degree of skill in science among the antediluvians, sufficient to have counteracted, or opposed, the overwhelming chastisement of the deluge."

Mr. Clarke proceeds to a history of the general deluge, "the universality of which the Arabians to this day strikingly express by their appropriate term of *Al Tufan*." *Al Tufan*! who does not perceive the striking and appropriate beauty of the term? "the word is well-cull'd, choice, sweet and apt, I do assure you, Sir!" Next come the dimensions of the divine Thebath, that Thebath, commonly, yea vulgarly, not to say pulpitically, nor yet tea-tabellically, and moreover among the speciallest species of porter-drinking, oxyphonic, puppet-show rhetoricians, called, appellated, as

\* Yet surely even *Al Tufan* must yield the palm of expression and appropriate beauty to the *Tomogkog* of the *Catawbas*. Mr. Clarke, we perceive, has a true sense of the sublime in language. How is it that he has overlooked the history of the *Tufan* or *Tomogkog* in the impressive diction of that great people? *Wame tohkékomuash quogkononogkodontash pohquodehuwanash, kah tomogkonne squoantamash kesukqut pohquaemoouk*. Here are words worthy to employ the lips, larynx, and lungs of Stentor! what a mouthful for *Garagantua*! what a gem to have: hone among the jewels of Mr. Clarke's Arabian, Hebrew and Sanscrit nomenclature.

the saying is, and annominated Noah's Ark. This is followed by a dissertation upon the mount Ararat, a happy subject, which enables Mr. Clarke to transcribe page after page from Sir Walter Raleigh's History of the World, and from the Asiatic Researches; he carries us not only to Armenia, but to Cashgar, Cashmir, Castwar, C'hasgar and C'hasagar; to Sheybar-Tag or Sheybar-Tau; to Vami-Nagari or Vami-Gram; and to Buddha-Bamiyan, whose venerable title has been maliciously distorted by the Mussulmans into But-Bamiyan; that Bamiyan which is called Sharma-Bamiyan or Sham-Bamiyan, for in Sanscrit Sharma and Shama are synonymous; as in this volume are Sanscrit and Sham. He travels between Bahlac and Cabul, as far as Bahlac and Badacshan, to Balikh and Balkh Bamiyan, to Cala Roh or the Black Mountain, and to Tuct Suleiman or the throne of Solomon; he astonishes us by the depth and darkness of erudition, we must not say *his* erudition, and he overpowers us by the authority of the Puranas and the books of the Bauddhists, of the Pharangh-Jehangeri, and the Buddha-dharma-charya-sindhuh.

Yet more *Arkana* of *Arkaiology*, for upon the principles of this great school this must be the true orthography. The historian of maritime discovery returns to the ark, the Thebath or Theba of the learned Theban: the Mundane Egg, the Argo, the Boutus, the Cibotus, the Centaurus, the Archeius, the Amphiprümnaïs, the Laris, Isis, Rhea and Atargatis of the antients, thus the author informs us; to which we add, from the stores of our own knowledge, the Arkut of the Ohios, the Shawanoes, the Ute was, the Nadouessians, the Messegagues, the Chickasaws, the Cherokees, the Choktaws and Catawbäs. He adduces new proofs of the universality of the deluge, and supports the veracity of Moses by the evidence of Mr. Maurice, who personally examined two teeth of an hippopotamus, and the entire tusk of an elephant, which were found buried thirty feet under ground by some workmen of Mr. Trimmer, at Brentford, six miles from London. He gives us also an account of ships actually built after the proportions of the ark, which proved the most complete and perfect models ever constructed for vessels of burthen.

Surely the admiralty will not permit so valuable a hint as this to be lost. We trust they will refer it to general Ben-

tham, and that we may soon see a royal Noah in the navy. But we must confess, we doubt the prudence of Mr. Clarke in publishing so important an idea during war; we will not suspect the loyalty of this gentleman, yet the times are serious, we are threatened with invasion, and a fleet of arks would be far more formidable than rafts or gun-boats, especially if it be considered how peculiarly they are adapted for transporting the enemy's cavalry.

Mr. Clarke has got into the labyrinth of fabulous history, and he mistakes every spider's thread for a clue. Here is a great quagmire through which no road has been made; Messrs. Bryant, Maurice and Co. have thrown down waggon loads of rubbish in it, and here comes this labourer and stirs about the dust. We will pass over the remainder of his historical memoir, this miserable patchwork of quotations, and examine the body of the work.

The first section gives a brief sketch of maritime history to the commencement of the fifteenth century. A more accurate account of the northern pirates might have been obtained from Mr. Turner's history of the Anglo-Saxons, a book, which, notwithstanding its defects of style, is assuredly the most laborious and praise-worthy historical work which this country has yet produced. A passage is quoted from Ossian, after Dr. Henry, to inform us "of the name of the daring prince who first invented ships and led a colony into Ireland." Surely it is no longer allowable for any, but a Scotchman, to quote Ossian as authority; moreover it interferes with Noah's claim, and we are therefore surprized to find Larthon placed at the head of the antient company of ship-carpenters. Of the naval power of Catalonia Mr. Clarke has gleaned a scanty knowledge from a French history of Genoa, which is like consulting a French historian for the victories of the English. These defects however are of little import: the progress of maritime discovery, not of maritime power, is Mr. Clarke's subject, and whatever preceded the age of the infant Don Henrique should have been condensed as prefatory matter. But some omissions we must notice and censure. Why are we referred to an unpublished appendix for the discovery of the Canaries? Was the volume already so stuffed with transcription that no

room could be found for the extracts from the admirable work of Glas? Beyond a doubt the Canaries were the first discoveries of naval enterprize, and yet in a history of maritime discoveries they are past over! We have to charge Mr. Clarke with a far worse omission: *he has made no mention whatever of the state of naval architecture or of nautical science.*

In the second section begins a sketch of the history of Portugal, compiled from compilations; this also is a work of supererogation, if that name can be applied to works which are not good. We can excuse no superfluous matter in a quarto volume, price three pounds eight shillings, which is to be the first of seven. This section is interlarded with the travels of Benjamin of Tudela, John de Plano Carpini, and William de Rubruquis: these travels are thus introduced as events which "*as they interested the whole attention of modern Europe, could not fail to produce a considerable effect on the minds of the most enterprising and best informed among the Portuguese.*" This is a curious passage; the journal of a Jew's travels in the year 1173 interested the whole attention of modern Europe! "The marvellous narrative of a traveller of Navarre *must have soon excited the curiosity of Alphonso.*" By an easy alteration of mood and tense the conjectures of the historian pass into the perfect indicative affirmation of history; he naturally *sought and obtained* a copy of the curious manuscript, and Alphonso *thus received* a new fund of geographical information, which had been hitherto concealed from the general attention of the western world, and the wanderings of a Jew, notwithstanding their eccentricities, may be considered as having opened a path for the enterprising spirit of a more distant age. Mr. Clarke indeed has through the whole section made vigorous deductions from the potential mood; "the manuscripts of learned travellers *must have been* a principal object of research to such a monarch as king Dennis," for so after his French authorities he misnames Diniz; "the expedition of count Henry to the Holy Land *is a point of much importance* in the progress of maritime discovery: *if he actually made such a voyage, he probably obtained some account of the seas and of the geography of India, and might thus have contributed to awaken a spirit of commercial enterprize among*

his countrymen, which at length *effected the developement* of the Indian ocean by the Cape of Good Hope:" the fact is, that count Henry's crusade is a mere fiction, of which we could *effect the developement* if this were the fit place, or if the *developement* had not been sufficiently *effected*. To the end of this section is subjoined what the author calls a concise account of the most distinguished Portuguese writers; in this catalogue there is scarcely a Portuguese name spelt aright, or a Portuguese title printed intelligibly.

The second chapter commences with the reign of John I. the father of prince Henry, whom Mr. Clarke every where calls duke of Viseo: duke of Viseu he was, as the prince of Wales is duke of Cornwall, and it is equally absurd to call either by his inferior title. By the duke of Viseu every Portuguese would understand dom Diogo, who was stabbed by John II. We proceed to the commencement of the discoveries, without dwelling longer upon the blunders which precede it: Mr. Clarke may correct them from Neufoille, or La Clede, or the Universal History.

"John the first, of Portugal, was eminently happy in the abilities and amiable disposition of children, who supported and adorned his throne: the spirit which animated their valour, never encroached on either the honour, or the affection, that was due unto a parent. The liberal education enjoyed by their father, rendered him anxious, that his sons should not alone depend on their rank for respect; and they repaid this solicitude by a generous emulation of his fame. Edward, prince of Portugal, was deeply versed in the laws and constitution of his country, under the immediate eye of his parent; the history of the different kingdoms of Europe, taught him at an early age the difficult, though glorious duty of governing a free people. John distinguished himself both in the camp and cabinet, and united in an uncommon degree the talents of the military character, with the keenness or versatility of the statesman. The fatal expedition to Tangier, which ended in the perpetual captivity of his noble brother Ferdinand, never received his suffrage, but from the first was opposed by every argument he could devise. Pedro, duke of Coimbra, was endowed by nature with a quick, yet solid understanding; in whatever light his character is beheld, its brilliancy attracts and gratifies the beholder. His eloquence, the voyages which he had made, and his travels both in Asia and Africa, induced the historian Castera, with others, to style him the Ulysses of his age. Pedro was admired in all the

courts of Europe; and, under the standards of the emperor Sigismond, the sword of don Pedro had been seen and dreaded in Germany by the Turks. When called to the helm as regent, he gave the whole of his charts and geographical manuscripts to the Duke of Viseo; who to kindred genius and talents, united the most determined and patient resolution. The religion of this prince, who was grand master of the order of Christ, blessed and elevated his designs; the propagation of the gospel was the sublime object of all his enterprizes: the words that were emblazoned on the shield of this illustrious knight, *TALENT DE BIEN FAIRE*, prove that he had imbibed the generous virtues of christianity.

“Three years before the reduction of Ceuta, the duke of Viseo had sent, in 1412, a vessel to explore the coast of Africa, which was the first voyage of discovery undertaken by the Portuguese. This attempt, rude as it now appears, was then pregnant with a series of alarm, particularly adapted to depress the resolution of seamen, who are always well versed in legendary horrors. Africa, from time immemorial, has been the land of wonder or fairy illusion; and though the industry of the eighteenth century may have removed many of the plausible theories that darkened the beginning of the fifteenth, we still have gained little more than a knowledge of its coasts. The philosophic ideas of Cicero, who collected whatever had been approved by the antients, were now become the errors of the vulgar; the arguments that convinced the reason of Pliny, may be allowed to have possessed some weight on the minds of Portuguese seamen: they believed, therefore, that the middle regions of the earth, in the torrid zone, teemed with scorching vapours; and that the unexplored southern continent of Africa, after extending in breadth towards the west, diverged with an unbroken sweep to the east; and having joined the continent of Asia to the eastward of the Golden Chersonese, the peninsula of Malacca, was not surrounded by sea, but stretched in breadth to the south pole.

“This first voyage of the Portuguese was annually followed by others; as the duke sent every year some ships to the coast of Africa, they gradually advanced beyond Cape Nam, which extending itself from the foot of Mount Atlas, had hitherto been the impassable limit of European navigation, and accordingly received its name from a negative term in Portuguese. But the mariners, who sailed with every instruction and encouragement their prince could furnish, were arrested in their course by the sight of a tremendous cape; which, at the distance of sixty leagues from the former, stretched boldly out towards the west, and formed the coast, they had hitherto passed from Cape Nam, into an extensive bay. With considerable alarm and disappointment, they beheld a frightful sea

raging on the shoals, which agitate its waves for six leagues: the terrors of the torrid zone were not forgot; their imagination presented its fiery flames and scorching vapours, and suggested that they might already have advanced too far. On their return, the dangers of the newly discovered cape were not diminished by narration; and the Spanish term of Bojar was given to the barren and dreary promontory of Bojadore.

“The systems which the narrow faculties of men frame in every age, and substitute for the sublime truths of nature, would here probably have repressed, at least for many years, the daring exploits of navigation, if the unprejudiced and clear mind of the Portuguese prince, had not dared to question the validity of the antient sages, the most enlightened philosophers, and the most accurate geographers, which Greece or Rome had produced. With a judgment matured by the converse of various scientific men, whom his patronage had attracted in Africa; and with a mind enlarged by the perusal of every work, which illustrated the discoveries he had in view, the conqueror of Ceuta returned to Portugal. The high land of Cape St. Vincent, as he approached the coast, displayed the extensive command of an ocean hitherto unexplored; and probably a view of its cliffs, at a time when his mind glowed with future projects of discovery, might suggest the first idea of constructing his romantic town of Sagres, on the *promontorium sacrum* of the Romans. Here, as Faria says, the view of the ocean inspired his hopes and endeavours: removed from the hurry of a court, from the fatigue or indolence of a military life, the prince indulged that genius for mathematics and navigation, which he had hitherto been obliged to neglect. At Sagres, his arsenals and dock-yards were constructed; whilst the industry or skill of the ship-wrights were improved, by the presence of their royal master. Under such auspices, the mariner's compass was brought into general use; a knowledge of the longitude and latitude, and the means by which they could be ascertained by astronomical observation, increased the skill of his seamen. The sea astrolabe, which derives its name from the armillary sphere, invented by Hipparchus at Alexandria, was improved, and introduced into the Portuguese service. Skilful mariners from all countries found encouragement to settle at Sagres. A public school and observatory was opened by the prince, in which an inhabitant of Majorca presided, of the name of James, whose experience in navigation, and the construction of charts, had reached the ears of this promoter of science.”

It would be needless to point out the groundless assertions and mistakes of this most inaccurate writer. There is no sufficient authority for affirming that a public school and observatory were

opened by prince Henry; the astrolabe was not introduced into navigation till long after that prince's death: if Mr. Clarke will refer to Barros, dec. i. liv. iv. cap. 2. he may there see when and by whom. Proceeding to the discovery of Porto Santo, he says, "the inhabitants were described by the discoverers as being in an intermediate state of civilization, that neither their conduct nor disposition betrayed any signs of ferocity." But it cannot be inferred from Barros that the island was peopled, and from the after history of the place it must be inferred, that like Madeira it was uninhabited. The settlers were compelled to abandon it, because the rabbits whom they had carried there, devoured every vegetable which they attempted to raise. What then became of the natives? did they eat the rabbits? or the rabbits eat them?

The discovery of Madeira is narrated with all the exaggerations of romance:

"It was the firm belief both of the inhabitants of Puerto Santo, and of the most enlightened among the Portuguese, that the sea to the westward beyond that island, which had originally been discovered by Juba, was not navigable on account of weeds and mud; that the course of a ship would also be arrested by concealed rocks, and dreadful whirlpools. This idea had originated with the antients, and was supported by a strange appearance in the horizon, that perplexed the minds of our navigators: to the south-west of Puerto Santo, a thick impenetrable cloud continually hovered on the waves, and thence extended to the heavens. Some believed it to be a dreadful abyss; superstition traced amidst the gloom, the inscription and portal of Dante; whilst the learned pronounced that it could only be the island of Cipango, where Spanish and Portuguese bishops had retired, with other Christians, from the persecuting Moors, and that no one could approach under the penalty of death."

"The Spanish pilot, with the Portuguese who accompanied Gonzales, were now shewn the dreadful shade, which continued to hover in the horizon to the south-west of Puerto Santo. Morales defied the terrors which appalled the greater part of the company; declaring it as his firm opinion, that what they beheld could only be the land they were in search of. After a consultation, it was determined, that the expedition should at least be delayed until the change of the moon, when probably some alteration might take place in this alarming spectre: its tremendous form however still continued; and the whole design would most likely have been frustrated, had not Morales insisted, that the ground of the concealed island be-

ing shaded from the sun by thick and lofty trees, a vapour was continually exhaled, which spread itself throughout the sky: he also added, that according to the information he had received from the English seamen in his Moorish dungeon, and the course they described to have held, the land enveloped in the dark cloud could not be very distant.

"The arguments, and experience of Morales, had little effect on the minds of any of his hearers except Gonzales, who at length yielded to their force; and it was secretly agreed between them, that the first favourable morning they should set sail, without any previous communication of their intentions to the rest. Accordingly, when the Portuguese least expected it, the vessels at day-break, and as Alcaforado relates on St. Elizabeth's day, were found boldly standing with a press of sail towards the dreaded abyss. If we consider the prevailing credulity and ignorance of the age, and the imperfect state of navigation, we must allow that the attempt required the consummate resolution of a mariner. The firmness of Gonzales, and the pilot, increased the apprehensions of those on board; for as the ship advanced, the high and extended vapour was observed to thicken, until it became horrible to view.

"Towards noon the roaring of the sea reverberated throughout the horizon. The Portuguese could no longer endure the painful suspense, and they called loudly on Gonzales, not to persist in a course which must inevitably terminate in their destruction. Gonzales, and the Spanish pilot, attempted to calm their agitation; they urged every possible argument to convince them, that the whole was an idle alarm; and at length reconciled their trembling companions to abide the event. The weather was fortunately calm; but the rapidity of the current obliged Gonzales to have his ship towed by two shallops along the skirts of the cloud; whilst the dashing of the sea on the breakers served as a guide, by which he either increased or diminished his distance.

"As they proceeded, the tremendous vapour gradually lessened towards the east, but the noise of the waves increased; when on a sudden, something of a deeper shade was feebly discerned through the gloom, the vessels still continuing at a great distance. Some persons, who probably caught a faint glance of the rocks, with which the shore is lined, exclaimed, that they saw giants of an enormous size. A clearness was at length remarked on the sea, the hoarse echo of its waves abated; and, to complete their joy, a little point, which received the name of San Lourenço, opened on the astonished spectators: doubling this, the high land to the southward extended before them, and, the cloud being dispersed, the woodlands, for a considerable distance up the mountains, were unveiled."

I have endeavoured, says Mr. Clarke;

in this account to reconcile the relation by Alcaforado, who was esquire or equerry to prince Henry, with that of *de Barros*. Having opened the latter part of this account, we will faithfully and to the letter translate the passage in *Joam de Barros*: "Joam Gonзалvez and Tristram Vaz, being called to a better fortune and more prosperity, did not chuse to return to the kingdom; still less to make their abode in that island, (*Porto Santo*.) But when Bertolameo Perestrallo had departed, they determined to go and see whether that thick shadow which the island now called *Madeira* made, was land. For a long time they had not been able to decide this; for, by reason of the great moisture contained there by the thickness of the woods, they always saw it, smoking with vapours, which seemed to them to be thick clouds; and at other times they affirmed that it was land, for marking the place they did not see it cleared away like other parts. So that being moved by this desire, they, seeing the sea fit for their purpose, passed over to it in two barks which they had built with the wood of the island, and they called it *Madeira*, because of the great and thick woods with which it was covered." *Decade i. book i. chapter iii. page 29. last edition.*

This is the narrative, and the whole narrative, as it is found in *Joam de Barros*. The method by which Mr. Clarke has reconciled it with the relation of prince Henry's equerry, is by disregarding the plain tale of the historian, and substituting in its place the whole romance which bears *Alcaforados'* name: romance we call it, for we do not believe that even Mr. Clarke himself, though he believes in *Kissæus* and *Jacob Bryant*, could believe he was recording history when he inserted the tale of the dreadful shade and the dreaded abyss. The phenomenon, if a fog is to be called a phenomenon, still exists. When abreast of *Porto Santo*, says *Stavorinus*, you first perceive a great haziness very like a thick smoke to the S. W. nearly ten degrees above the horizon, which on a nearer approach is dissipated, and the high land of *Madeira* rises to view, yet still enveloped with clouds, half way downwards from the summits of the hills. Neither *Joam de Barros*, nor *Maria y Sousa*, poet and hyperbolist as he was, have exaggerated the common circumstance.

On prince Henry's application to the pope for a bull to establish his right to the discoveries, we are told that the Jesuits were not insensible to the advantages they might thus obtain. *Ignatius Loyola* was not born till long after prince Henry's death. Mr. Clarke has fallen into the common absurdity of disguising the faults of his favourite: the unfortunate expedition to *Tangiers* did not arise from the military ardour of king *Edward*, as he has stated; king *Edward* was averse to the expedition, but his weak temper yielded to the pertinacity and artifices of Henry. In this instance, a foolish courage led prince Henry; a more criminal cowardice made him desert his brother *Pedro* in his distresses. These circumstances are not necessarily connected with the "Progress of Maritime Discovery," but Mr. Clarke has uniformly exalted the characters of his heroes by this species of falshood. In one instance he has been guilty of a worse disingenuity: it is in the account of the sufferings of *Gama's* men from the scurvy:

"With this pestilent infection and sickness, our men were greatly discomfited, and many of them dyed thereof; which also put the reste of the companie in greate feare and perplexitie of minde. Yea, and further would have increased and aggravated their griefes of bodye, and sorrowes, were it not, that one *DA GAMA*, a man of good nature and condition, had taken speciall care and used greate diligence, for the recouerye of their healths, and putting them in comfort: who continually visited the sicke, and liberally departed unto them such wholesome and medicinable things, as for his owne bodye he had provided and carried with him. Through whose good counsell given, great paines taken, and franke distribution of that he had, many of our men recovered, which would otherwise have died, and all the rest thereby were greatly recomforted."

By this passage thus printed in italics, with the name *da Gama* in capitals, it is evident that Mr. Clarke wishes to make the reader believe that it was the commander of the expedition who thus gave his own private stores of medicine to be divided among the sick. Yet it is rather extraordinary that an historian should call him *one da Gama*; and the absurdity will be felt if we imagine Dr. *Hawksworth* writing of the benefit which the sailors of the *Endeavour* experienced from the humanity of *one Cook*. Mr. Clarke instead of condensing a narrative from *Castanheda*, has given scraps of an old

translation, "after a careful comparison" of it with the original Portuguese: but the original Portuguese says, that Paulo da Gama was the man who performed this act of humanity. Paulo da Gama, the brother of Vasco, to whom the command of the expedition was first offered, but who declined it, not having health for the charge, and consented to serve under his brother, and who died himself on his return, perhaps from the want of those very medicines which he had thus distributed. Did Mr. Clarke make this ungenerous alteration himself? or did he only aid and abet the old translator in this lie by implication, by permitting the mistranslation to remain after his "careful comparison," and forcing it into notice by italic types and capitals? The character of Vasco da Gama has been usually misrepresented; we have been taught to class him with Columbus, for his hideous and hellish cruelties have been industriously concealed.

An account of Cada Mosto's two voyages concludes the history of the discoveries during prince Henry's life. It is remarkable that Barros makes no mention of this navigator, though his narrative was printed nearly fifty years before the publication of the first decade.

The next section narrates the voyages of Pedro da Cintra, and the Portuguese pilot from Ramusio; and carries on the history till the death of John II. One ludicrous error must be noticed for its oddity: the king of Portugal is said to have had a Jew rabbi for his confessor. In his account of Covilham Mr. Clarke has been misled by Bruce. Frequent dispatches, says that traveller, came from him to the king of Portugal, who, on his part, spared no expence to keep open the correspondence.

"In his journal Covillan described the several ports in India which he had seen; the temper and disposition of the princes; the situation and riches of the mines of Sofala: he reported that the country was very populous, full of cities both powerful and rich; and he exhorted the king to pursue, with unremitting vigour, the passage round Africa, which he declared to be attended with very little danger; and that the cape itself was well known in India. He accompanied this description with a chart, or map, which he had received from the hands of a moor in India, where the Cape, and cities all around the coast, were exactly represented."

This is in direct contradiction of all

the Portuguese historians; no tidings were ever received from Covilham, from the time when he entered Abyssinia, till the Portuguese found him there, long after king John's death. Ruy de Pina, in his chronicle of king John, mentions him as a man lost; and all the other historians affirm that he was never heard of till after the lapse of many years. The passage in Bruce is very extraordinary: it will hardly be supposed that he found copies of Covilham's journal and chart in Abyssinia; but unless he actually did find such copies, the only solution is, that he wrote the passage from memory, having no documents before him, and has thus altered the account which was sent *orally* by the Jew from Cairo, into written papers from Abyssinia. That the passage is erroneous is indisputable. Some hydrographical remarks are appended to this section; here the author mentions as a desideratum, accurate observations of the width and depth of *all the rivers in the world*, with observations on their bars.

In the following section we have a rambling inappropriate retrospect of Indian history, from the Macedonian discoveries to the close of the fifteenth century.

The last section comprizes the outward voyage of Vasco da Gama. This is related by alternate scraps from the old translation of Castanheda, and from Mickle's *Lusiad*, for "the Lusitanian Homer," says the author, as *he must have had access to many authorities now lost, or not generally known, is justly entitled to the authority of an historian; his means of information were ample and extended from Portugal to India.*" Even if this could by any possibility be admitted; it would not follow that Mr. Mickle's translation was entitled to the same confidence; for no poem was ever so licentiously translated as the English *Lusiad*; the English poet has every where inserted without scruple whatever he thought would improve the original. The extracts from this version fill twenty pages of this part of Mr. Clarke's history.

The appendix contains 263 pages, of which ten only are "original correspondence;" the rest consists entirely of republications.

The character of this work may easily be summed up. Above two-thirds of the volume are filled with unnecessary

matter; with extracts from common books, the republication of papers which are not scarce, and the recapitulation of historical facts which have no relation to maritime discovery. Long notes are every where annexed to long digressions, like the hairs of a mole, the excrescencies of an excrescence, deforming deformity. The part which actually relates to the professed subject of the work, might have been comprized in a small octavo volume; and that part is badly executed. Instead of comparing the accounts of various authors, and digesting them into one connected narrative, Mr. Clarke has indolently sewed together scraps whenever they would suit his purpose, contrasting occasionally the rust of Hakluyt and the old translator, with his own modern tinsel. The price of the volume has been unnecessarily enhanced by engravings, admirably executed indeed, but which are altogether superfluous. The spectre of the cape, for instance, is the frontispiece. Still more absurdly has a view of Columbo harbour in Ceylon been introduced, upon these grounds: Mr. Clarke enters into a discussion concerning the situation of Solomon's Ophir; he enumerates the various opinions of the thousand and one authors who have

discussed the question; and "after much consideration" he inclines to give the preference "to that distinguished scholar, Samuel Bochart, who in his valuable work on sacred geography, entitled *Phaleg and Canaan*, demonstrates with equal ability and reason, that Ophir was the great island Taprobana, since called Zeelan and Ceylon, which produces gold, ivory, precious stones, and peacocks." He has therefore given a view of the Ophir, that is, of Columbo harbour: this is a perfectly flat shore, with a few trees and fortifications, being no doubt the batteries erected by the Jews; and to fill up the plate, an Englishman of war brig is added, representing, we presume, one of the fleet sent, in conformity to treaty, by his present Majesty, to protect the possessions of his good ally, King Solomon, against the machinations of Tippoo Saib, Bonaparte, and Nebuchadnezzar.

When we consider the important nature of this work, and that it was projected "under the auspices, and with the approbation" of the then first lord of the admiralty, we cannot but feel that a compilation so every way despicable, appearing under such patronage, is to be considered as a national disgrace.

ART. III. *A Journal of Travels in Barbary, in the Year 1801.* By JAMES CURTIS, Esq. Surgeon to the Embassy to Morocco. With Observations on the Gum Trade of Senegal. 12mo. pp. 157.

MR. CURTIS accompanied the English ambassador, in 1801, from Gibraltar to Fez: in this little volume he relates such circumstances as he saw or heard during his journey.

The embassy landed at Tangiers. The old castle, he tells us, remains as it was left by the Portuguese; for the Moors never repair a building, though they do not scruple to add to it. The town itself, like all Moorish towns, is dirty, and with narrow streets; the houses all whitewashed, a pernicious custom in so hot a climate: the number of blind in consequence is very great; and there is scarcely one person in ten free from the *gutta serena*. The population is computed at 15,000 souls. Tangiers was once a strong place; it baffled the army of Portugal for many years, and once gave that country a severe lesson, ominous of the fate of Sebastian. The fortifications are now in a ruinous state; yet the parapet wall which surrounds it has the appearance of strength. The storks perch

on it in great numbers; so constantly indeed, and in such number, that the author at first mistook them for soldiers. The stork, we believe, is every where a sacred bird; perhaps because he builds upon churches and mosques: and having there been usually protected by the sanctuary, a sanctity has been attributed every where to his nest. The whole trade of Tangiers consists in supplying the opposite coasts with provisions; their markets are held thrice a week, abundantly supplied, and of course cheap: they resemble English fairs, cattle are bought there for sale, and tradesmen and handicrafts of every description pitch their tents, for the people never think of having any work done but on these days. Add to this, bustle of business, shows, jugglers, and dancing to the Moorish tambourine; and the work days in Tangiers resemble our holidays in England.

"The fertile valleys of Barbary, (says Mr. Curtis,) the rich and extensive corn-

fields; and the exquisite perfumes of the flowers; *present the appearance* of one vast cultivated garden; or rather of a land flowing with milk and honey." This venerable metaphor has seldom been more unhappily introduced. There is however no doubt that this country is one of the most delightful in the world: nature is no where better, and man no where worse. The grass grows five or six feet high; the vineyards are most luxuriant. Every part of the country round Tangiers is beautiful, and interspersed with villages and gardens. All the foreign consuls reside here.

The governor of Tetuan escorted the embassy:

"He is about forty-five years of age, with hard features, and was formerly a muleteer, but by his good conduct obtained the countenance of the emperor, who finally rewarded his merit with the government of Tetuan. On his arrival, he presented the ambassador with two mules laden with fruit from Tetuan, and announced the necessity of our departure, and encampment on the next day at a short distance from the town, in order to give the muleteers an opportunity of ascertaining the particular baggage entrusted to each of them, without which there would be unceasingly fighting. It was not a little curious to hear them enquire for the brother of a trunk, a peculiarity of expression unknown in Europe, but which our interpreter informed us was the common language of Barbary, where every article that has been put with others, carried on the same animal, or bears the least resemblance to another, is always denoted by the term brother."

Mr. Curtis is mistaken in supposing that the peculiarity of expression is unknown in Europe. It is a common idiom both in Spain and Portugal; whoever has resided in either country, must have heard of the *brother* of his boot, his glove, &c. our English word "*fellow*" has originated in the same *anthropomorphism* of language.

"The governor came to receive the presents and our baggage on the 26th. His soldiers were drawn up in a line fronting the consul's house; but on his leaving it, they formed a semicircle, and saluted him with a profound reverence, at the same time exclaiming, "Long live our noble master." While he was mounting his horse, one held the head, another the tail, half a dozen the stirrups and bridle, and others assisted him in placing himself, and this is the usual mode in which the people of Barbary display respect to their superiors.

"On the 27th, after dinner, we marched to our encampment about three miles from

Tangiers, at a place called Swance, and were accompanied by all the consuls of foreign powers, and the governor of Tangiers with a body of horse, colours flying, and all the pomp of the Moors; but the banner of Haghigh-Hage was always carried before the British ambassador throughout the whole journey. A supper was prepared by the governor for the embassy on their arrival, which, though good, had such a quantity of garlick mixed with it, that we could not taste it; but some of the *kus-kus*, which I shall have occasion fully to detail hereafter, is wholesome and excellent for the inhabitants, though ill suited to the palate of an Englishman.

"We struck our tents early on the morning of the 28th, but from some delay in the distribution of the baggage, we were not able to leave the ground till seven o'clock. The Moors, like all the oriental nations, have no idea of measuring distances according to the European method, and therefore they calculate them by the hour; hence I conclude we travelled at the rate of about three miles and a half each hour. Our retinue was composed of the ambassador, the vice-consul, myself and servant, an artificer from the corps at Gibraltar, two interpreters, a cook and hair-dresser, with two other servants of the ambassador; the alkaide, or governor of Tetuan, with sixty horse soldiers as our guard, sixty mules and six camels for transporting the baggage. The ambassador and his suite marched in front of the soldiers, and this order was preserved throughout the whole journey."

In this parade the embassy proceeded. The country is represented to be in a high state of cultivation, and well stocked with every kind of cattle; they frequently met droves of five hundred and a thousand each, attended by only a little boy. These boys collect their droves by a whistle.

In his orthography of Moorish words, Mr. Curtis is always regulated by his ear; he therefore not only differs from other writers, but often from himself. He uses *douwar* and *derwar* confusedly; sometimes the governor of Tetuan is Haghigh-Hage, at others Hagh-Hagh; Arzilla is sometimes spelt Azilla, sometimes Ozilla; we have Alkaide, Alkasar, La Rach, with the same disregard or ignorance of established usage.

The governors of all the provinces through which the English were to pass, had received orders from the emperor to provide them with every necessary. These orders were well obeyed, the English, it seems, being in high favour with the Moors, and for a singular reason.

"Mahommed having declared that Englishmen would at some future period be converted to the faith, the Moors are led to believe that the time is now approaching, as there can be no doubt the English have been already inspired by the prophet, since they have extended their powerful protection to the religion of the musselmén in Egypt. Under such a favourable prepossession, it was evident our embassy could not have been sent at a more propitious moment, for the emperor had just received intelligence of the defeat of the French army in Egypt."

Their road lay by Alcacere, a town which is said to have lost 10,000 persons, half its population, by the plague. Our traveller, upon asking the governor his age, was greatly surprized to learn that he could not answer with exactness, and that there was not a Moor in the country who could tell his own age with precision: all they know is, that they were born a little before or after some public event, a battle or a rebellion. They were entertained here with music, and Mr. Curtis mentions with wonder that the objects of their songs were the pleasures of the bottle. It is possible that, like the songs of Solomon and Hafiz, they may have been mystic poems, whose allegoric meaning was not understood. Mosquitoes and locusts annoyed them cruelly on their journey; with their sufferings from the former we can sympathize; but we do not understand how they could be infested by the latter, unless encountered by an army, or the stench of a putrefying swarm. At Fez they were received with public honours, and fared sumptuously, being of a nation whom the emperor delighted to honour.

"Our house consisted of four large apartments, with folding doors to each, opening in front of an extensive garden filled with fruit trees; a square court-yard, in the centre of which was a cold bath of considerable dimensions, supplied at each extremity by a fountain. The house was furnished in the Moorish style, with fine carpets and cushions, &c. but we desired them to be removed, and substituted in their places our beds and camp furniture. The emperor now sent ten large dishes of *cus-cus sou*, made of fowls, mutton, and fruit, six huge baskets filled with apples, pears, plumbs, and various kinds of fruit from his garden. Presently after, he sent an additional supply of six dishes of *cus-cus sou*, some of which weighed an hundred pounds, for our supper, which enabled us to afford a glorious repast to our soldiers and muleteers. When we retired to rest, we flattered ourselves that after a fatiguing march of eleven

days, we might enjoy the luxury of undisturbed repose. But the vast numbers of frogs and toads which infest the city and its vicinity with their hideous croaking from sun-set till sun-rise, and the quantity which were about our bath, absolutely deprived us of rest. When I rose on the morning of the 6th, and offered some money to the Moors if they would either destroy or remove them from the bath, they peremptorily refused, on the ground that they were blessed by the prophet, and if one were killed, the destroyer would inevitably be seized with some malady. Fortunately, I found a Jew who destroyed the whole for the consideration of six reals, but the Moors were so incensed against him, that it might have been attended with fatal consequences to the man, had it not been for the powerful protection which we afforded him. On the most ridiculous points, the Moors must not be trifled with, when their religion is concerned.

"The emperor sent this morning a note to Hagh-Hagh, in which he commanded the alkaide to provide every thing suitable to the dignity of an ambassador from so powerful a nation as the English; "do not let us disgrace ourselves," said he, "in the eyes of the English people, but endeavour to exceed whatever has been done on any former occasion."

Yet notwithstanding the imperial favours, the English were somewhat inconvenienced by the intolerant stupidity of Moorish prejudices. When they were entering the city, a madman insisted that they should stop and hear him pray: and madmen being saints in Morocco, they were obliged to comply. It was irksome to walk the streets: Mr. Curtis was repeatedly stopped, that the people might gratify their curiosity by inspecting his clothes; and often were they compelled to turn back and seek some other way, because the mob would not suffer them to pass by the house of a saint. Two hundred thousand persons were destroyed in this city by the plague: but Mr. Curtis is very careless in his narration, and in another place states the loss at 170,000; and even this is probably over-rated, for what a population does it suppose! Morocco, he says, lost 300,000; surely this is absurdly exaggerated. The circumference of Fez is stated to be between seven and eight miles, and the number of persons contained within that space, 800,000. Was Mr. Curtis ignorant of the size and population of London? The following document is curious, and is to be received with due distrust; it was detailed to him by one of the talbs of Fez, whom he calls a great historian.

Men capable of bearing arms . . . . .	121452
Mosques . . . . .	982
Fountains . . . . .	530
Baths, supplied by an aqueduct from the mountains three miles distant from the city . . . . .	249
Houses large and small . . . . .	137610
Inns, or places of refreshment . . . . .	567
Shops (exclusive of bake-houses) . . . . .	11696
Mills for grinding corn . . . . .	89
Bake-houses . . . . .	1405
Soap-boilers . . . . .	19
Tan-yards, employing upwards of 4000 men and boys in each . . . . .	14
Linen bleachers . . . . .	32
Dyers shops . . . . .	86
Talbs or attornies offices . . . . .	245
Painters shops (the principal part of whom died of the plague, whose loss is much deplored) . . . . .	800

The imperial gardens are described as equalling whatever has been delineated by poets; they are laid out in the European style by a gardener from Lisbon. This is a vague word, and we know not what is meant by European, whether English, French, Dutch, or Portuguese. They abound with fountains and cascades, and the collected waters form a large river, which runs into the Sabu. Eolian lyres are placed upon the *noras*, the water wheels which supply the reservoir. Where these *noras* are common, their creaking is enumerated by the nation as one of their rural delights; though to an English ear, unused to the association of pleasure with whatever is connected with water and coolness, the sound is very irksome; indeed, we cannot conceive how an Eolian harp could be heard near one. We are ever more disposed to err from credulity than from suspicion, yet we confess that the following passage has staggered our faith in the traveller's veracity:

"I took my usual walk on the terrace, having my pockets filled with fruit. The

ladies soon gathered round me, and after I had presented them with fruit, they asked me to give them handkerchiefs to put round their heads: but as I had none about me, I promised to bring some on the following evening. They have no idea of modesty, and their dancing and romping absolutely put me to the blush; they are uncommonly fond of intrigues, particularly with Christians, as I have been informed; they imagine there is something very curious about a Christian which he always endeavours to conceal from them."

If all other travellers are to be trusted, Mr. Curtis would never have returned to boast of his imprudence.

Fez is called the holy city, because Mohammed is said to have resided there; by a fiction in the same catholic spirit, he was once said to have been born at Cordova. The present emperor has erected a building over the grave of a saint, who vies in miracles with any in the martyrology; he heals all diseases; and when Mr. Curtis expressed his wonder to the panegyrist of the wonder-worker, that so many miserable objects were to be seen in the streets, though his chapel was always full, he was told, "there cannot be room for all." So suspicious is the emperor, that he would not take a dose of salts until he had seen its effects on another person. His taster's place must be something more than a sinecure. This precaution was carried farther in Egypt; when Bruce prescribed for a bey, the wretched patient required him to exhibit the operation of the medicine on himself first.

Mr. Curtis was unfortunate enough to be taken prisoner on his passage to Gibraltar, and stripped of all he brought from Barbary. The little volume is eked out by observations on the gum trade of Senegal, which is transcribed from Golberry's Travels (see the next article) merely to swell the book.

ART. IV. *Travels in Africa, performed during the Years 1785, 1786, and 1787 in the Western Countries of this Continent, comprized between Cape Blanco of Barbary, 20° 47', and Cape Palmas, 4° 30', North Latitude. Embellished with a General Map of Africa, corrected from the most authentic Observations and Discoveries; together with Plans, Views, &c. &c. By SILVESTER MEINRAD XAVIER GOLBERRY. Translated by William Mudford. 12mo. 2 vols. 360 pages each.*

AT the peace of 1783 the French were once again the acknowledged masters of their ancient possession, the Senegal; and every facility appeared to have been afforded them of penetrating into the interior, and of being the first

to explore the unknown regions of Africa. They were sole masters of one of the largest of its rivers, the Senegal; had an establishment at Galam, to which great power might be given; and an extensive influence, by which, according

to M. Golberry, they might progressively have established themselves in the country of Bambouk, and have proceeded even to Tombouctou and Tocrrur. All their enterprizes in this river were carried on with secrecy and safety; they had also a much-neglected right of navigating those of Salum, of the Gambia, of Casamanca, of St. Domingo, of Rio Grande, of Nuno Tristo, of Sierra Leona, of Sherbro, and of Cestos; their connection with the Moors of Zaara; their ascendancy over many great kingdoms of Western Africa; and lastly, continues Golberry, "our social qualities, which inspire these African nations with a *natural affection* for us; do not all these form an immense resource of means by which to penetrate into the very heart of Africa? and yet France remained indifferent to all these exalted and noble enterprizes, of which every thing promised success."

In the year 1785 M. Boufflers was appointed governor of Senegal, and M. Golberry accompanied him as his first aid-du-camp, instructed at the same time to perform the functions of chief engineer of the whole of this government, and appointed to reconnoitre that part of it which was formed by the western and maritime countries.

The instructions which M. Golberry received were of so comprehensive a nature, that he had occasion to reside in many of the principal countries of that part of western Africa, contained between Cape Blanco and Cape Palmas: he tells us that he had seen and conversed with twenty different black nations; that he has made "numberless observations;" and collected from the English of the Gambia and Sierra Leone, and from various other quarters, a body of documents and memoirs, forming the materials of a very minute work, which, since his return to France, has unceasingly employed his attention. The vast number of plans, maps, designs, &c. which were to have accompanied this minute performance, retarded the execution of it so long, that the author suffered his information to be anticipated by an English traveller. "It was not, therefore, without great regret that I beheld the voyages and discoveries of Mungo Park published in 1799, and which yet awarded to the English the merit of having made the first successful advances in this path, which I had

considered as peculiarly belonging to us."

In consequence of this grievous disappointment, the present is merely a collection of fragments and extracts from that large work which has cost so much labour and expence! M. Golberry surely must be endued with a diffidence, which is by no means characteristic of his countrymen, to have suppressed the publication of a book of travels through the interior of Africa, because one solitary individual had explored those regions, and communicated to the public the narrative of his journey. An instance, this, of very singular diffidence!

To give any thing like a regular account of the contents of these volumes would be scarcely possible: they abound rather with particular than general information, which will be considered as of more value in France than in England. The merits of Golberry are so fairly estimated by his translator in a single paragraph of his preface, that we are induced to transcribe it. "His details on the commerce, connections, establishments, &c. which relate to Africa, are often highly important; and he appears to have been indefatigable in procuring such authentic information as might be of use to the commercial interests of his own country, and indeed Europe in general. But his antiquarian disquisitions are not perhaps so valuable; and in his conjectures relative to the origin of many of the African nations, he indulges too much in hypothesis, seldom referring to known facts, but endeavouring to build a Utopian foundation by the aid of conjecture."

"Indeed when every merit is allowed the work, which accuracy, and information, and labour, and research, can justly entitle it to, it may still be said, that he mars its general excellence by the introduction of false and idle theories. Nor can I conceal another very prominent defect, which is, a disgusting and tedious repetition of similar facts. Thus we are twice told in one page that Cape Verd derives its name from the boobabs that grow on its summit; twice we are told that the palm-date produces clusters which are called *die*; thrice and more we are told that the Moors nourish themselves principally with gum; and many other such instances of useless tautology."

In twenty different places we see M.

Golberry doing homage to the superior genius of the English; perpetually regretting the commercial inertness of his own government, he acknowledges, with a sigh the spirit of industry and research, the enterprize and activity of our countrymen. He is extremely anxious to enlarge the limits of the government of Senegal; he would have the supreme administration of it situated in the island of St. Louis, and thinks that its influence might be extended over all that portion of western Africa, which is comprehended between the thirtieth and fortieth degree of north latitude, and between the Atlantic ocean and the thirtieth of longitude of the island of Ferro.\* The advantages which would result to France from such an extension of territory are enlarged on, and a plan is chalked out, considerably in detail, for the establishment of factories, commercial intercourse, and government. Golberry says that the precipitate abolition of slavery, and the slave-trade of the blacks, has reduced the French affairs in Africa almost to nothing: to re-establish them, therefore, it will be necessary to discover new sources of commercial wealth, and to direct their stream towards the coasts. He wishes the slave-trade to be put under some better regulations, but can scarcely check his *just indignation* in deploring the consequences of "those cruel theories"—referring to the "chiefs of a sect" which arose in London and Paris, for the purpose of abolishing slavery,— "which have caused so many misfortunes, so much destruction, and which have cost such deluges of blood and tears." It is curious enough that in a few pages afterwards, (vol. II. p. 240 et seq.) M. Golberry should represent these Africans, whom he dooms to slavery with so much complacency, as the happiest set of people in the world.

"The climate and character of the African blacks, assimilate in such a manner, as to render them singularly happy.

"Gifted with a carelessness, which is totally unique, with an extreme agility, indolence, sloth, and great sobriety; the negro exists on his native soil, in the sweetest apathy, unconscious of want, or the pain of privation, tormented neither with the cares of ambition, nor with the devouring ardour of desire."

After a description of this mode of life, he continues:

"Thus all the wants and pleasures of a negro are gratified without occasioning to him the least trouble either of mind or body; his soul hardly ever rouses itself from its quiet and peaceful indolence; all violent passions, inquietudes, and fears are almost unknown to him; his fatalism makes him neither hope nor dread any event; he never murmurs, but submits to all, and his life passes in unruffled calmness, in voluptuous indolence, which constitutes his supreme pleasure; hence we may reckon the negro among the most favoured and happy productions of nature."

So much for Mr. Golberry's refined ideas of human happiness!

The most interesting chapters in this work are those which give an account of the gold mines of Bambouk, and of the gum, and gum-trade of Senegal; these are really curious, and the latter particularly so.

The gold mines of Bambouk are a national property, over which the kings or farims have no other personal authority than that of watching over and protecting them: the inhabitants work those which are situated within their own territory. The country of Bambouk is represented as being strictly an auriferous earth; but the four principal mines are those of Natakou, Semayla, Nambia, and Kombadyrie. The working of the mines is carried on during the eight months of dry weather, and ceases when the rainy season commences. As all the gold is obtained by ablution, those blacks who best understand the method of working it obtain the greatest quantity of gold. They obtain it by digging pits about six feet in diameter, and varying in depth from thirty to forty feet. The earth is brought up by baskets, taken to a rivulet, and undergoes a thorough ablution. When they have dug about four feet deep, they meet with a fat argillaceous earth, intermingled with small grains of iron ore, of loadstone, and emery, all which are covered with little particles and spangles of gold. All the rivulets of the valley of Natakou convey gold with their water; the sands and mud which form the bed of them are also full of the same metal; the soil composing the bed of the Colez-Rio-d'oro produces a

\* Throughout the work the island of Ferro is generally adopted as a first meridian.—REV.

considerable quantity of gold, as does also the whole plain of Natakön. From all these circumstances M. Golberry is induced to believe, that the mountains surrounding Natakön contain in their beds and caverns the real gold mine; while the monticule of Natakön itself is nothing more than an emanation from the main body.

In the year 1786, M. Golberry carried on a small trade for gold at Galam; that which he received was made into ear-rings and other ornaments. It was assayed at Paris, in 1788, and, according to the account of the assayer, it was twenty-three carats fine. It was sold at the rate of twelve francs per drachm: and a gold ear-ring, from the mine of Natakön, in the form of a heart, of three inches in length, weighing more than seven grains of fine coloured gold, was examined by M. Sage, professor of mineralogy, and one of the directors of the mint, and discovered to be gold of the purest quality.

Without noticing the plans which M. Golberry has suggested to his country, relative to Bambouk and its gold mines, we shall proceed to abstract his account of the gum, and gum-trade of Senegal.

This vegetable secretion, so useful in a great variety of manufactures, was formerly brought from Arabia to Marseilles, by way of Egypt; the gum from Arabia being the only one in request, till the Dutch introduced that of the Senegal into Europe, at the commencement of the 17th century. When the French became masters of this river, and of the harbours of Arguin and Portendick, they soon found that in the southern parts of the great desert of Zaara, near the Senegal, amidst sandy and uncultivated regions, there existed three considerable forests of gum trees. These were minutely examined, and various experiments evinced that the gum itself might rank with the best gums of Arabia. Some subsequent experiments made by the merchants of Bourdeaux and Nantz, have even decided its superiority. These experiments were made public; they stamped a value on the gum collected by the Moors of Zaara, which became celebrated, and is at the present moment one of the most important articles of commerce. It is employed in the manufacture of silks, gauzes, lawns, hats, cambrics, printed linens, &c.; it is used by painters, and gilders; and is

moreover employed in confectionary and medicinal preparations. Senegal can furnish Europe with an annual supply of two millions of pounds weight; to collect this, and convey it to France, would require a large capital, and employ a number of vessels and sailors. This quantity of gum, at the average price of 35 sols per pound, will produce a sale of 3,500,000 livres, and a profit of nearly 3,000,000.

The tree which yields this gum is a species of *miinosa*, and called by the Moors and negroes near the river, *Uereck*, when it produces white gum, and *Nebueh* when it yields the red.—These two species are the most numerous, and grow abundantly on those white quicksands along the coast from Cape Blanco, of Barbary, to Cape Verd; and on those to the north of the Senegal, from Galam to the factory called the Desart. There are many other species besides these two, which, however, are the most valuable as well as the most numerous; and of which there are three large forests, those of Sahel, Al-Fatack, and El-Hiehar, situated at the southern extremity of Zaara, at about an equal distance from the Senegal and the sea.

The gum-tree of the Senegal is generally about 18 or 20 feet high, and about three feet in circumference: it is crooked, irregular, and inelegant; the stocks of a year old rather resembling bushes than shrubs. This effect is attributed to the aridity and badness of the soil; but more particularly to the keenness and malignity of the east winds, which prevail here throughout the winter. The leaves of the tree are alternate and bifid, very small, and of a dry dirty green: the branches are thorny, from the part where the leaves project; the flowers are white and very short; the trunk is full, hard, and dry; the bark smooth, and of a dark green colour. They who desire more detailed information relative to the gum-trees of the Senegal, are referred to the works of M. Adanson, who resided in Senegal upwards of fifty years, and has given a description of every species which grows in the countries between the twentieth and fourteenth degree of north latitude, and from the borders of the Atlantic Ocean to the eighth longitudinal degree from the island of Ferro.

The Moorish tribes, who frequent the western part of the Senegal, for the pur-

pose of selling their gum to the French, are three in number, the Trarshaz, Brachknaz, and Ouled-El-Hagi or Darmarcko; who appear to have enjoyed, for many centuries, the possession and commerce of the southern countries of Zaara, in the desert of which they have fixed establishments.

The tropical rains do not fall in the western countries of Africa till towards the beginning of July: the return is so regular, that it rarely happens in the countries watered by the Senegal, that the rainy season begins much before the first of July, or that it is prolonged beyond the first days of November.

"When the lands have been abundantly saturated, by these heavy rains; when the waters begin to disappear, and when the sands begin to dry, which is towards the 15th of November, then also we may perceive oozing from the trunk, and principal branches of the gum trees, a gummy juice, which at first has no consistency, but trickles down the trees; at the end, however, of fifteen days this juice becomes inspissated, adhering to the incision whence it issued, sometimes twisted in a vermicular form, but most commonly in round or oblong drops: these are white when proceeding from the white gum tree, and of a yellowish orange colour, bordering a little on the red, when proceeding from the red gum-tree.

"The drops are always transparent, and brilliant at the part where they are broken off; when they are held for a short time in the mouth, they possess all the clearness, transparency, lustre, and limpidity of the finest rock crystal.

"These gummy exudations are entirely natural, and the Moors solicit them by no kind of artifice, or any sort of incision.

"These precautions would indeed be superfluous, because the variations of the atmosphere in the season immediately succeeding that of the heavy rains, alone increases infinitely the clefts on the surface of the bark, and by means of these, which answers every purpose, the gums find a natural and easy passage.

"Towards the 10th of November, the easterly winds begin to prevail, or rather those of the north-east. These winds are dry and blighting; they are burning two thirds of the day, and cold during the night and morning."

The drops are usually about the size of the egg of a partridge: they are occasionally, however, both larger and smaller.

"About the beginning of December, the three Moorish tribes quit those habitations which they have formed, in the vast solitudes

of Zaara, and where they have collected their families, their flocks, their camels, and their wealth, and each tribe begins its march towards their respective forests of gum trees.

"At the different oases, they suffer to remain only decrepid old men, imbecile women, children, and young girls; all those who are employed in tending the flocks, in educating the horses and camels, and other indispensable occupations; the black slaves are also left behind.

"All the rest form an immense army, the disposition of which is equally confused and savage; it is a wild assemblage of men, women, young girls and boys, children at the breast, and an innumerable number of camels, oxen, and goats.

"The kings, princes, and the rich people, mount their horses, and their camels; others ride on oxen, and some again proceed on foot.

"After a march of twelve or fifteen days each tribe arrives at its respective forest, and at the borders of which they pitch their tents.

"The harvest continues about six weeks, and when the gum, thus collected, is properly formed, and every thing in readiness, they prepare to strike their tents and proceed to the banks of the Senegal. They load the gum on camels and oxen; the ordinary burthen of a camel is from four to five hundred pounds, while that of an ox, is generally about a hundred and fifty; the gum is put into immense leathern sacks made of tanned ox hides.

"All the gum which is thus collected, and packed up, is not placed all at once on the beasts of burthen who are to convey it to the banks of the river and to the different markets where it is sold; the chiefs of the tribes alone proceed to these markets, accompanied by a certain number of the principal Moors, who always are, or pretend to be, relations of the kings, or of their favourite women; they are followed by an escort of armed men.

"The king and the principal officers of the Trarshaz, treat for their tribe separately; while the king and principal men of the Brachknaz and the Darmarcko, treat for their two tribes conjunctly.

"While the chiefs of these tribes are conferring relative to the price at which the gum shall be sold, the Moors remaining behind at the camps, load their cargoes, and commencing their march, halt about two days journey from the river; here they wait the conclusion of the conferences between their chiefs and the overseers of the government of the Senegal, and with the French merchants.

"These preliminaries superinduce numerous delays, debates, and embarrassments; there is no kind of trick which these Moors do not employ, no lies and imposture which they do not invent, to obtain for their gum,

a price much greater than that of the preceding year. The kings and chiefs play off a thousand cheats, and every species of craft, to sponge a greater quantity of presents, and imposts than had been given before; and to obtain this end, menaces and finesse, are successively employed; the most ridiculous and exaggerated pretensions are every year renewed by these subtle and cunning savages, who make it a practice in all their dealings, to create a multitude of obstacles and difficulties.

"It is only the agents and the overseers of the gum trade who with the merchants proceed to the desert and to Podhor for the purpose of purchasing this commodity; and they well know that in these savage fairs, much tedium, inconvenience, and bustle, must be endured.

"The Moors in their roguish dealings, possess a coolness, which distracts the whites; their patience and phlegmatic conduct, singularly disconcerts the viracity of the Europeans, who full of ardor and impatience wish to strike the bargain at once, while the Moors, in order to enlarge the presents, or the profits, incessantly defer a final termination. Meanwhile we also arm ourselves with patience, become cautious, obstinate, and heady, and thus finish by mutual opposition.

"When every thing is completely settled on both sides, the Moorish chiefs return to their camps, and announce to their tribes that the market may now commence. They then begin their march, and a few days afterwards they settle on the banks of the river.

"It is at this place which the French have named the desert, and which in fact, is one of the most arid, and desolate places in the world, that the gum fair is principally held; it is situated on the borders of the river, at an equal distance from the isle St. Louis, and the fort of Podhor: and the Trarshaz, convey thither all the gum procured from the forest of Sahel.

"Here the eye surveys an illimitable plain, formed of white and moving sand; not a single herb, not a plant, nor even a bush destroy the melancholy uniformity, the painful monotony of this immense solitude. It is impossible to procure here, even a drop of good water, and shallops laden with hogsheds, are obliged to be sent a considerable distance up the river to procure it, for at the desert the waters are brackish, they being mingled with those of the sea, which flows in the Senegal, as far as the island of Gick; another reason is, that the sands of the desert, are so fine and so moveable, that it is impossible to dig any wells, without the water being considerably intermingled with sand.

"On the morning of the day of their arrival, may be heard at a distance the "hubbub wild" of these Moorish armies, enveloped in a cloud of dust; and towards noon, the immense solitary plain of the de-

sart, where the eye wanders without discovering any object living or vegetating, is covered with a numerous multitude of men, women, camels, horses, oxen, and goats.

"All the animals are canopied with the leafy branches of the gum-trees, which at once serve to secure them from the ardent heat of the sun, and the gum with which they are laden.

"One part of these animals carry the tents and baggage, while on others are heaped the women, who are seen suckling their children, and young kids just littered. The chiefs are mounted on noble horses; some chosen camels, elegantly caparisoned, bear the women of the king and princes, in a kind of basket, covered with an awning; a troop of Moors, armed with fusils and sagayes, which are lances from eight to ten feet high, form the escort of these ambulatory hordes, and vainly endeavour to maintain some degree of order among this barbarous multitude.

"The air rings with the acclamations of this innumerable quantity of men, women, children, and animals, and the living creatures which now fill this lately desert plain, appear incalculable. It is impossible to convey a just idea of the disorder and tumult of such a confused assemblage, or to give an accurate picture of the singular uproar which pervades these barbarous meetings.

"When the Moors are all assembled together on the banks of the river, and their tents pitched, and every thing arranged and disposed for commencing the traffic, a cannon is fired as a signal to begin.

"Innumerable are the train of disgusting and unpleasant circumstances, which attend these negotiations. The agents, as well as the merchants, are incessantly surrounded and pressed by these untutored and perfidious savages; they must be immovable in the midst of their injuries, their insults, and their menaces; they must endure poignards raised against them, threatening looks, outrageous expressions, and revolting gestures; they must submit to the perpetual importunities of kings and princes, to the insatiable cupidity of their women, and in fact to the oppressive persecutions of all the tribes.

"The merchant is now no longer master of his vessel; all the decks of the ships employed in the gum-trade, and which are seldom less than a hundred tons burthen, are covered with Moors, crowding on each other towards the fore part of the vessel; the stern is defended by field pieces, and a part of the crew who remain under arms.

"During the years 1785, 1786, 1787, the quantity of gum, annually brought to the factories of the desert, and the Cok, amounted to eight hundred thousand pounds, besides which the Trarshaz Moors, conveyed yearly to Portendick, near four hundred thousand pounds, where it was purchased by the English.

"Hence the three forests of Sahel, Al-Fatack, El-Hiebar, furnish yearly a constant produce of at least twelve hundred thousand pounds of gum."

The vessel employed in buying and selling the gum is a large wooden tub, containing about 2000lbs. weight, which is fixed on the deck of the gum-vessels: the Moors call it a *kantar*, and the French have adopted the name. Each vessel has its *kantar* fixed upon the deck: at the bottom of the *kantar* is an aperture eighteen inches long and a foot broad, to which is fixed a tube of thick sail-cloth, descending into the hold of the ship. Whilst the gum is measuring, the aperture at the bottom of the *kantar* is closed by a small board running in a groove; when the *kantar* is full the board is withdrawn, and the gum runs through the tube into the hold, where people are ready to stow it. Crafty as the Moors are, they are too ignorant to suspect the effect produced by a few inches being added to the height or diameter of these measures; the consequence of which has been, that the European traders, who know perfectly well how to enlarge their *kantar* when they buy, and diminish it when they sell, have completely out-cheated them. This fraud has been practised by all the traders who have purchased gum from the Moors of Zaara; and they seem to have emulated each other in their progressive additions to the *kantar*, which now holds four times as much as it did formerly. Golberry says, that in the time of the India Company (sixty years ago), it contained but little more than 500lb. weight of gum; it now holds 2000lbs.

The Moors are paid for their gum in pieces of calico dyed blue, called guinea pieces; they are seven or eight ells long, and half an ell wide. This is the chief, indeed the only article which they will take in exchange.

Attempts have been made in France to imitate these guinea-pieces, but the imposture never succeeded: without confiding in the senses either of touch or sight, the Moors instantly ascertain whether a guinea-piece is fabricated in

France or India, *by the smell*. The real India pieces are in the highest estimation: they have no rival as to preference.

From the year 1780 to 1787, the Moors constantly gave a *kantar* of gum, of 2000lbs. weight for fifteen guinea-pieces: the gum company established in Senegal, in 1784, never gave more; and they annually purchased four hundred *kantars*, or about eight hundred thousand pounds weight.

Mr. Golberry now enters into some details concerning the possible produce of the gum-trade, and the important advantages which would be derived from an extension of this branch of commerce. The abundance of gum-trees in the vicinity of the island of St. Louis, and the banks of the Senegal, is immense: besides the three forests we have already mentioned, there are two others, Guero and Galam; and there are numerous gum-trees scattered about in the islands and circumjacent countries, from which M. Golberry supposes might be extracted from one to two hundred thousand pounds weight annually. When the Moors quit their oases, and encamp themselves round the gum-forest of Zaara, the middling and lower classes subsist almost entirely on this gum, during the whole of the harvest, on their march to the banks of the Senegal, during the fair, and until they return home. Six ounces of gum are sufficient to support a man 24 hours: it is occasionally dissolved in milk, but oftentimes suffered simply to melt in the mouth. A lozenge is occasionally made, by combining it with the juice or flesh of animals, which will keep uninjured for a twelvemonth.—

This work contains a good deal of information on various subjects, but there is no connection between its parts, no form, no order; tautologies, inconsistencies, theories, facts, politics, and natural history, are jumbled together in the most whimsical manner imaginable. The plates and map of Africa are execrable: the translation is full of gallicisms, is inelegant, and not always correct.

ART. V. *Walks and Sketches, at the Cape of Good Hope; to which is subjoined, a Journey from Cape Town to Blettenberg's-bay.* By ROBERT SEMPLE. 8vo. pp. 152.

DURING Mr. Semple's residence at Cape-Town, a former schoolfellow, his intimate friend, arrived there on his way to India. The short time that he spent in the colony, was employed by the two friends, in pedestrian excursions to the most interesting places in the vicinity, and in inquiries on the one hand, and explanations on the other, relative to the characteristic manners and customs of the inhabitants. After the departure of his friend, Mr. Semple accompanied an acquaintance to Blettenberg's bay; and the little volume before us is a description of the principal objects, occurrences, and remarks, which suggested themselves on these occasions.

The minuteness of Sparrman, the philosophic views and scientific description of Barrow, are not to be looked for in these pages; but many new and pleasing remarks on the state of society and civilization, interspersed with agreeable description, just sentiment, and occasional pathos, are conveyed in correct and elegant language; and the reader is most agreeably surprized at the various pleasure that he derives from so small a volume, with so unassuming a title. No former travellers or historians of the colony are quoted, to supply the deficiencies of personal observation, to throw an air of importance over the book, or to enhance its price at the expense of its value. The author has obviously seen with his own eyes, and described what he saw, while the emotions to which they gave birth were yet vivid.

It would be unjust to the author to make large extracts from a small volume: our readers however will be gratified, and we trust that Mr. Semple will excuse us, if we yield to the temptation of quoting part of his very interesting description of the several kinds of slaves, who are united in one common bondage at the Cape of Good Hope.

"Behold that slave coming towards us bending beneath the weight of two cords of wood suspended to the ends of a bamboo which he balances across his shoulder. His black complexion, his curly hair, his thick lips, and his tattooed forehead, announce him from the coast of Mozambique, his strong make shows him capable of fatigue and in his inoffensive and humbled countenance,

you may read that he has often submitted to blows and unmerited reproaches, without for a moment thinking of revenge; he performs the task which is set him without objections and without inquiry. You see him now walking slowly along oppressed with his load, and perhaps you pity his fate; follow him to the next corner, there sits one of his companions playing on a jew's-harp. He stops—he listens—pleasure steals into his soul—he throws off his load—he beats the ground with his heels—raises his hands clasped above his head—gives himself up to the wildest and most inconsiderate joy, and, occupied only with the present, thinks neither of the hours of bitterness which are past, nor of those which are yet to come.

"Observe the one who comes next. Even at a distance his upright form, his nervous make, his free step, announce the Malay, or native of the island of Java, the king of slaves. As he approaches mark his long, coal black hair which hangs half down his back, his yellow complexion, his glancing and jealous eye, which looks askance upon slavery. He knows well that from his class are formed the house painters, the musicians, the ingenious workmen of the Cape. He is proud of this distinction, and glories in the name of Malay. He exacts some deference from his master, his gestures, his speech, sometimes slow and sedate, at others rapid and violent, seem to say, 'I know that I am your slave, but be cautious how you use your power.' A reproach stings and irritates him, a blow wounds his proud heart, he hoards it up in his remembrance, and broods upon his revenge. Time passes on; the master forgets that he has given the blow, but the Malay never. At length the bad part of his character is cruelly displayed: he intoxicates himself with opium and the madness of revenge, he rushes upon his unguarded master with his kris or crooked Malay dagger, and stabs him once, twice, ten times. The unfortunate wife and children are not safe if they cross his way, he sallies out into the street, and running madly along, sacrifices all that he meets, till overpowered by numbers he is brought to suffer the punishment of his crime.

"Follow him to the place of execution. Some days are past, and the intoxication of opium is over, but do you observe his countenance in the least changed by fear or remorse? Not at all. He is bound to the wheel—the executioner breaks all his limbs one after another—but not a tear, not a groan escapes him—at length nature is exhausted—perhaps he breathes the name of Mahomet his prophet, and expires with the consolation of having had his revenge.

"What a contrast is presented to this character in the slave whom you see there

following his master. His features of the European cast, his slender but well formed shape, his mild and inoffensive looks, and his black hair curled but not woolly, announce the harmless native of the Malabar coast. He is in all respects the best of the household slaves. Without the inactivity or dulness of the Mozambiquier, or the penetrative genius of the Malay, he forms an excellent medium between the two—more intelligent, more industrious, and more active than the former; more docile and more affectionate than the latter, he unites steadiness with vivacity, and capability of instruction to winning manners. Expect not from him violent opposition—while the native of Mozambique often grows obstinate, and hardens under the lash; whilst the Malay frowns and prepares to sharpen his dagger, the Malabar bends to the blow, and endeavours to avert it by tears and entreaties. Never is he brought to justice for crimes of a heinous nature; never are his feeble hands stained with blood; but if, through a false accusation, or a disposition too liable to be made the tool of knavery, one of this class is brought to suffer death, he shudders, and turns away his head at the sight of the place of execution; he shrieks aloud whilst the blow is yet suspended and before it falls, and with tears and groans he implores compassion till his life and sufferings are at an end.

“ But come, let us leave scenes of blood, the place of execution, and its wheels and engines: behold yon light waggon advancing so rapidly upon us, drawn by fourteen or sixteen oxen, and led by a Hottentot who runs before them; see with what dexterity the master, sitting in the front of the waggon and cracking his long whip, directs the whole. The Hottentot, as you would observe, has on him nothing of what in England would be called clothes; an undressed sheep skin buckles round his neck, and hangs down behind him like a cloak; at every motion of his body it flies back and exposes his tawny skin, his meagre make, and his small and active limbs; before him hangs a small pouch fastened round his loins with a leathern thong. With not a single other article of dress, without hat, without shoes, he leads his oxen through sun and wind and rain, over stones and hot sandy roads. Sometimes he puts on a pair of undressed leathern sandals, which are fastened round the ankles; and sometimes an old tattered hat protects his head from the rain or sun; but neither of these is universally worn; and in general the one which has passed us may serve as a specimen of all the rest. It is true, he has not the name of slave, but his condition is not on that account in the least more desirable; by the laws of the colony he is only bound to serve five and twenty years, after which he becomes free. In other words, his master enjoys twenty five

years of his services for the prime of his life, and may then cast him off to seek his bread elsewhere.

“ These may be reckoned the four principal stocks of the slaves of the Cape. The Malay, the native of the Mozambique and Malabar coasts, and the colonial-born slave. It must not be imagined, however, that these different races are anxious to preserve themselves unmixed. In this place they are quickly mingled together, and many a slave can boast of an European father. Hence results the most complete variety of features and shades of colour, that is perhaps to be met with in any part of the globe. Yellow, jet black, white and copper-coloured are kneaded together into a mass. Every face that passes us is of a different colour from the one that went before it, and the eye is continually amused by a strange and unceasing variety.

“ The different females preserve likewise in their domestic occupations something of the character of their nation. The female Malay takes care of the house, gives an account of every article, arranges the linen and clothes in the presses, is intrusted with several of the keys; and, having finished her work, she coils up her long black hair on the crown of her head, where she fastens it with a silver bodkin, and then sits down to knit at the feet of her mistress.

“ The Malabar female, mild and gentle, is like her husband, employed in every kind of the lighter domestic occupations. No blows are required to induce her exertions; a threat terrifies her. She redoubles her activity, is anxious to show herself attentive to the interest of the family, cleans and arranges the furniture; and in the evening, having kissed her children and put them to sleep, she brings her knitting needles and seats herself by the side of her companions.

“ The female of Mozambique, generally stronger than her fellows, yet at the same time sufficiently active and intelligent, is sometimes employed in works of drudgery, and sometimes in those of a lighter kind. According to the will of her owners, sometimes you may see her carrying on her head a large bundle of linen to wash in the brook which runs from Table Hill. Sometimes nursing the children of the family, and advanced to honour; but in either occupation, she is always found, like the male, patient, performing what is set to her, and no more; pleased with praise, but not over anxious to obtain it, and going through her task more through the wish of seeing the end of it than the desire of performing it well.

“ The female Hottentot contents herself with the lowest class, and is indeed seldom employed by the families at the Cape, being chiefly and indeed almost only to be found in the farm houses and at some little distance from the Cape. The Hottentot character, both male and female, is said to be the least

engaging of the whole. They neither make themselves so useful as the Malay, nor do they possess the affectionate disposition of the natives of Malabar or Mozambique.

They labour only through absolute necessity, and would quickly sink into profound indolence if not perpetually incited to action."

**ART. VI.** *An Account of the Native Africans in the Neighbourhood of Sierra Leone: to which is added, an Account of the present State of Medicine among them.* By THOMAS WINTERBOTTOM, M. D. Physician to the Colony of Sierra Leone. Vol. I. 8vo. pp. about 400, 8 plates and maps.

WE are informed in the preface that the medical history of the negro tribes, in the vicinity of Sierra Leone, was at first the principal object of the author's attention; to which "was subjoined, a brief account of the manners and customs of the people, whose diseases had been noticed. But this account being increased so much by successive additions as greatly to exceed the limits originally marked out for it, and the medical part being thought likely to prove uninteresting to many who might be desirous of perusing the rest of the work, it seemed advisable to alter the arrangement, and print each part in separate volumes, in order that the general reader might be at liberty to purchase the one, without being obliged to purchase the other also."

In consequence of this information, we shall only notice at present the first volume of Dr. Winterbottom's work, referring the medical part to its proper place, in Chap. XVII.

It appears to us, that the really original matter in this volume might, without any extraordinary abbreviation, be comprized in a few pages. The author himself characterises his work as a "rude sketch," a "collection of gleanings, which either have escaped the notice of more successful reapers in that extensive field, or which have been passed over as of little importance." This, we doubt not, is a fair though very modest description of such facts, as were collected and noted down on the spot, from Dr. Winterbottom's personal observation, but it is by no means applicable to the manufactured article as it appears in the London market. So far from being a collection of loose hints, the volume is systematically arranged in fifteen chapters, treating in the regular order of the principal objects of enquiry relative to this part of Africa: numerous quotations from the most respectable writers are introduced in corroboration of the facts recorded; and passages from the Roman and English

poets are cited, to give an accurate and vivid image of scenes which they never beheld, and of which they could form no idea.

The first chapter contains a general topographical description of the country in the vicinity of Sierra Leone, together with the circumstances of its discovery by the Portuguese. To this succeeds the meteorological history of this part of Africa, which contains but little of importance that we have not met with before elsewhere. In the appendix, however, is an interesting document on this subject, from which it appears that in the year 1793, the medium temperature at the colony was 83° Fah. and the greatest range of the thermometer from 71° to 95°. The barometer for twelve months varied only from 29.81 to 30.09, the average being 29.95. The number of rainy days was 154, during which there fell 86.28 inches of rain: of these 138 days happened in the months of May, June, July, August, September, and October, in which the amount of rain was 79.5 inches. The wet season was ushered in and terminated by stormy weather; no less than 27 tornadoes (out of 52, the whole yearly complement) having taken place in May and October.

The third chapter treats of negro agriculture, which is of the rudest kind. An uncleared spot of ground is prepared by cutting down the trees as near to the surface as can conveniently be done during the dry season, and then setting the whole on fire a short time before the rains commence. As soon as the first showers have extinguished the flames and softened the ground, the rice is scattered on the surface, and scratched in with a hoe, which is all the labour required till harvest. Every village has a plantation of corn in common, besides private gardens, in which are cultivated the usual excellent vegetables of the tropical countries. The art of cookery among these negro tribes is next treated of, their different prepa-

rations of vegetable and animal food, their spirituous and intoxicating liquors. Here, however, we meet with nothing sufficiently new and important to detain us; we shall therefore proceed to the next chapter, in which the African towns are described. The villages belonging to the Pagan negroes on the coast, who are the least civilized, are small, crowded, and unhealthy, from being situated, for the sake of security, in the most intricate and impenetrable recesses of the woods. The Mahometan tribes, on the contrary, being in a much more advanced state of society, are distinguished from the rest by the neatness and superior size of their brick houses, and the greater populousness of their towns; Teembo, the capital of the Foola kingdom, being reckoned to contain about 8000 inhabitants.

The arts, manufactures, dress and amusements, government and political institutions of the negroes, are successively described by Dr. Winterbottom, with a needless minuteness, since no additional information of the smallest consequence is communicated. The same may be said of the chapter relative to the state of the women, and the old question concerning the influence of polygamy on population.

The moral character and mental powers of the negroes are vindicated by the author, with considerable success; and this being the most original and interesting, and the best written part of his book, we shall here select our specimens.

"They (the negroes) are in general of mild external manners; but they possess a great share of pride, and are easily affected by an insult: they cannot hear even a harsh expression, or a raised tone of voice, without shewing that they feel it. As a proof that they are not deficient in natural affection, one of the severest insults which can be offered to an African is to speak disrespectfully of his mother, which is called "cursing her;" that they do not feel so very acutely an insult offered to their father is a natural consequence of polygamy.

"The hospitality of the Africans has been noticed by almost every traveller who has been much among them. When the colony of Sierra Leone was destroyed by those who styled themselves the friends of

liberty, and the inhabitants were stripped in the most wanton manner of the comforts they were enjoying, when their houses\* were burnt, their provisions and even medicines destroyed, and they themselves reduced by this cruel treatment to the prospect of disease, famine, and misery, *queque ipse miserrima vidi*; they were all, whites as well as blacks, most hospitably received by the natives, into whose villages they were obliged to fly for shelter. In travelling through many parts of their country; when overpowered with heat, fatigue, and hunger, I have ever met with a welcome and hospitable reception on arriving at their villages; mats have been brought out for myself and friends to repose on; and if it happened to be meal-time, we have been at liberty to join them without ceremony, or to wait till something better could be provided. If we intended to spend the night there, a house has been set apart for us, and, on taking leave in the morning, a guide has generally offered to shew us on our way. Indeed, so far does this spirit of hospitality prevail, that a traveller or stranger, as they call him, is scarcely accountable for any faults which he may commit, whether through inadvertency or design, he host being considered as responsible for the actions of "his stranger."

The negroes upon the coast, from their habitual intercourse with the European slave-factors, are, as may naturally be expected, much inferior in every thing, except the art of making a bargain, to those who reside higher up the country: and of all the tribes, those who have embraced Mahometanism are the most civilized and respectable. In this part of Africa the religion of Mahomet has lost much of its ferocity, and instead of being propagated by the edge of the sword, appears as the benign patroness of arts, civilization, and literature: its influence seems to be rapidly extending, and the national character of the negroes is rising in exact proportion. The honour that is attached to the arts of reading and writing in this country, may be judged of by the following extract:

"Those who have visited the schools instituted by the Mahommedans, for the instruction of children in Arabic literature, must have admired the industry and perseverance of the scholars, at the same time that he lamented the great loss of time spent in acquiring a knowledge of the Arabic,

\* It must be acknowledged, however, that the French left the bare walls of the huts belonging to the Nova Scotian settlers uninjured, after having plundered them of their contents, even the wearing apparel of the women and children, and destroyed those articles of furniture which they could not carry away.

which would have been so much more profitably employed in learning to read their own or some European language. In these schools the boys read, or rather shout, their lessons as loud as possible: the same is observed by Dr. Russell, speaking of the Mahommedan schools at Aleppo: "as they read aloud all together, the noise they make in getting their lessons may be heard at some distance." This noise is rendered still more grating to the ear by their harsh and guttural pronunciation. Such, however, is their quickness of perception, that, amidst this confused clamour, if a word be wrong pronounced, or falsely accented, it is immediately noticed by the master, or corrected by one of the scholars, among whom a strong spirit of emulation prevails. The boys begin their studies at least an hour before day-light in the morning, and protract them till late at night, taking some respite during the middle of the day. In the dry season, before sun-rise and after sun-set, they generally sit in the open air round a large fire, which affords them light, and for its support each scholar brings a bundle of faggots. Their lessons are written with ink which washes out, by means of a reed cut in form of a pen, upon thin smooth pieces of wood of a close grain like beech; the letters are first written, then the combinations of letters, and lastly passages of the Koran. When they can read and write with facility, the master receives as his reward, for each scholar, a slave, or the value of one; but if he fails in this point, he receives no recompence for his trouble. As writing constitutes one of their chief amusements, they are anxious to excel in it, and many of them write with great expedition and a tolerable degree of elegance. They procure paper from Europeans, but use a reed instead of a pen. They procure a very excellent ink by boiling the leaves of a tree called *bulanta* in water: this is generally done in an iron pot, containing some scoria of iron from a smith's forge. After it has boiled for a considerable time, the liquor is set aside to cool, and is then strained for use: it is of a dark purple colour, and is extremely durable. They generally make use of a large snail-shell to keep it in, to which a little cotton is added to absorb the ink. A similar receptacle is also used for their ointments:

—Funde capacibus

Unguenta de conchis.

"They set a high value upon some of their manuscripts: an old man, who had a small duodecimo book of a quarto form, containing extracts from the Koran very neatly written, and ornamented with views of the Caaba, &c. at Mecca, refused to sell it for eight slaves, as it had been at Mecca, or, as he expressed it, "had walked to Mecca."

"The Mandingos and Foolas are passionate admirers of Arabic literature, in

which they are tolerably proficient; and it is to be ascribed partly to the shackles imposed by their religion, and partly to the debasing effects of the slave trade and the obstructions it presents to improvement, rather than to a want of genius, that they have made so little progress in other sciences.

"Niebular observes, that he has often shewn to the Arabs books printed in their own language which they could scarce read. I have, however, more than once seen the Africans read Arabic books; one in particular read several chapters of the New Testament in Arabic, and of which he appeared to have a just comprehension. Several others explained passages in Arabic books, particularly Richardson's Arabic Dictionary, giving the sound of the words very nearly as they are there written, and in general explaining the meaning of them very exactly."

The appendix to the work before us consists of five parts: the first is a meagre description, in eight pages, of the colony of Sierra Leone, in which we do not find a single word of the state of morals and manners, of the government, and the influence among the natives of an establishment so perfectly unique in its objects, and so truly honorable to its patrons. We expected to have learnt the state of the missions, which no doubt must by this time have extended themselves over the whole neighbourhood; with what degree of success they have arrested the progress of Mahometanism, or rivalled that religion, by bestowing on the barbarous and pagan tribes the invaluable blessings of British legislation and christian morals. We knew from the reports already published how the settlement was established, that its black population consisted principally of the Nova Scotia free negroes, that it was nearly ruined by the French in 1794, and from its situation in a tropical climate, near the mouth of a river, and at the foot of a ridge of mountains, we could easily conceive the general character of its scenery. But all these circumstances are detailed by Dr. Winterbottom, and the really interesting information concerning the degree of success which has attended this new experiment of colonization and proselytism, is wholly withheld.

The second part of the appendix is the meteorological history of the colony for the year 1793, already mentioned. The third, and by far the longest part, is a republication from the Philosophical Transactions, of Mr. Smeathman's account of the Termites, inserted here merely for the sake of eking out the

Volume. The fourth and fifth parts are vocabularies of the Timmanée, Bullom and Soosoo languages.

The two maps are tolerably well executed. Of the other engravings, the less that is said the better.

ART. VII. *An Account of the Island of Ceylon, containing its History, Geography, Natural History, Manners and Customs of its various Inhabitants; to which is added the Journal of an Embassy to the Court of Candy. Illustrated by a Map and Chart. By ROBERT PERCIVAL, Esq. of His Majesty's Nineteenth Regiment of Foot.* Quarto pp. 420.

CIVILIZATION, like charity, begins at home: it cannot be expected that a government should extend towards the colonies it has established, or the countries it has subdued, that unfettered freedom and enlightened policy, which it withholds from its own subjects. But the long-neglected truth now begins to be attended to, that the loyalty, and fidelity, and attachment of a people are better secured by a system of conciliation than by a system of terror; and that a liberal policy is more conducive to the interests of both parties than an oppressive one. We have reason to hope that this wise and humane system will be adopted throughout our vast empire in the east; the college, which has recently been established at Calcutta under the auspices of Marquis Wellesley, is intended to promote the study of the oriental languages, and by that means to facilitate an intimate acquaintance with the genius, the character, the manners, the usages, the prejudices, and propensities of the different people submitted to our governance, as being essential to the enactment of wise laws, and the administration of equal justice.

In this career of conquest, whether in America or the east, the Portuguese adventurers had no other object in view than to aggrandize their nation, and enrich themselves in the shortest and most summary manner. When Albuquerque succeeded in the conquest of Ceylon, instead of maintaining a friendly intercourse with the natives, and inducing them to assist in the cultivation of the island, every species of insult and barbarity was practised towards them. Not only was any little wealth they possessed seized by the rapacious grasp of avarice; but their manners and customs were trampled upon, and their religious opinions were not merely insulted, but even persecuted with the most wanton cruelty. A desultory, but sanguinary warfare continued for nearly a century; and the unhappy natives found, that their struggles against the discipline and concerted plans of the Portuguese, who

derived every advantage from the mutual animosities of the petty princes of the island, were fruitless and without hope.

At this period, however, they had the offer of very powerful assistance from the Dutch, who had "no sooner succeeded in throwing off the Spanish yoke, than their commercial and enterprising spirit led them to explore every coast in the known world in search of opulence." In the year 1603, the Dutch admiral, Spilberg, approached their coasts, and the natives, from their hatred of the Portuguese, gave him a very favourable reception. During the constant wars in which the princes of the island had been engaged, the king of Candy had acquired such a superiority, that at the arrival of the Dutch, he was looked upon as emperor of Ceylon. He accepted the proffered alliance, and offered every facility to the Dutch, who, after a long continued siege, took possession of Columbo, in the year 1656. Thus ended the dominion of the Portuguese in Ceylon, exactly a century and a half after the first arrival of their countrymen in the island.

So great was the joy of the Ceylonese at their deliverance, that the king of Candy willingly paid the Dutch the expences of their armaments in cinnamon, and conferred upon them the principal possessions from which they had expelled the Portuguese; "among these, were the port of Trincomalee, and the fortress of Columbo: the former of these, which lies on the north-east part of the island, is that harbour which renders Ceylon the most valuable station in the Indian ocean." Columbo was built originally by the Portuguese, in the south-west part of the island, in the heart of that tract most celebrated for the production of cinnamon, as the most commodious station for collecting that staple production of the country. It is now the European capital of Ceylon.

For some time, the Dutch bore their honours so meekly, that the Ceylonese looked upon them without jealousy, and

were eager, by their good offices, to shew their gratitude to the *guardians of their coasts*, for such was the humble appellation which the Dutch assumed. The most friendly intercourse was kept up with the natives, who parted with the natural productions of the island on very easy terms, affording the greatest commercial advantages to the new settlers. Ere long, however, the cloven-foot of avarice appeared: the Dutch began not only to push their posts farther and farther into the interior, and to seize upon every spot which appeared well adapted to cultivation; they also increased their demands upon the king for the protection they afforded him, and he soon found that all the cinnamon which grew in his dominions was insufficient to gratify the *guardians of his coasts*. Enraged at their repeated extortions, he at last fell suddenly upon their settlements, where he committed the greatest devastations. This breach was followed by a long course of hostilities, in which the Dutch, though generally victorious, were the greatest losers; for the incursions of the natives into their cultivated possessions on the coast frequently destroyed the labours of years. The Dutch governors saw the ruinous system they were pursuing, and endeavoured to restore tranquillity; but the calm was of no long duration. The renewed oppressions on the part of the Dutch were the constant signal for the renewal of hostilities between them and the natives, who, in the course of a long warfare, became brave and dexterous, and often repulsed their enemies even in close combat. Twice, indeed, the king was driven from his capital of Candy, but he found refuge and security in the impenetrable mountains of Digliggy, whence he could, with impunity, surprise and cut off the enemy's stores and convoys of provision till they should, of their own accord, abandon his dominions.

Mr. Percival, from whose brief introductory account of the successive changes which the island has undergone since it came into the possession of Europeans, we are selecting these particulars in common with many others, at first felt surprise, that a tract of land, cut off from all external supplies, and every where surrounded by European settlements, should have defied every attack of its enemies. But the whole country is high and mountainous; the

approaches are steep, narrow, and scarcely accessible, except by persons on foot. The thick jungles and woods every where obstruct the view, and they are only penetrable by narrow and intricate paths, known but to the natives themselves, whose conscious inferiority to the Europeans in the open field, leads them to concealment among the bushes, whence they fall suddenly upon the enemy, and hastily retreat from one position to another before he has an opportunity of observing the course they have taken. By this mode of warfare, the Dutch suffered as much after their victory as before; the effects of the climate too, which, in the interior, is very unwholesome to Europeans, in consequence of the immense woods which cover the whole face of the country, the heavy dews of night, and the intense heat of day, unrefreshed by sea-breezes, were severely felt by the Dutch troops.

These causes, together with the enthusiastic attachment of the Ceylonese to their own mountains, and their deep-rooted antipathy to the foreign nations who had successively invaded their ancient territory, combined to frustrate the attempts of the Dutch at forming a settlement in the interior of the island.

The last great war which was carried on with the natives was about the middle of the last century; Candy was taken, and a treaty was agreed on in the year 1766; by which, the king was virtually a prisoner in his own dominions: the tributes which he paid were so various and oppressive, that the Dutch had a monopoly of all the valuable productions of the island. The terms, indeed, were so harsh and degrading, that the Candians were exasperated against their oppressors, and nourished the most inveterate hatred.

Such was the situation in which affairs stood between the Dutch and the native Ceylonese towards the commencement of the late war; no other European power had acquired permanent footing in the island since the expulsion of the Portuguese, about one hundred and forty years before. The attempt, which we made to reduce the island under Sir Edward Hughes, at the latter end of the American war, was unsuccessful, but the importance of it to Great Britain is so great, that on the first rupture with the Dutch, there could be no doubt but that we should attempt the reduction of

it. The junction of the Dutch with the French republic in the late war, was the signal for the commencement of our operations against their colonies in the east; a body of troops was detached for the conquest of Ceylon, in 1795, and the enterprise was crowned with success. It is to be hoped, that we shall profit by the severe lessons received by the Portuguese and Dutch: their system of rapacity and oppression must, by its inefficacy, teach us to adopt a more liberal and humane policy; and as their relaxation of military discipline was fatal to their interests, it will warn us by no means to neglect any requisite measures of defence.

"The island of Ceylon lies between  $5^{\circ} 40'$  and  $10^{\circ} 30'$  north latitude; and between  $79^{\circ}$  and  $82^{\circ}$  east longitude. It is situated at the entrance of the bay of Bengal, by which it is bounded on the north. On the north-west it is separated from the Coromandel coast by the gulph of Manaar, a narrow strait full of shoals, and impassable by large ships. It is distant about sixty leagues from Cape Comorin, the southern point of the peninsula of India, which divides the Coromandel and Malabar coasts. Its circumference is computed to be about nine hundred miles; and its length from Point Pedro at the northern extremity to Dunderhead at the southern is about three hundred miles. Its breadth is very unequal, being in some parts only from forty to fifty miles, while in others it extends to sixty, seventy, and even one hundred."

The island of Ceylon is of the first consequence to Great Britain, whether considered in a commercial or political point of view; its internal produce presents several rich articles to commerce; and it is remarkable, that with the exception of Bombay, it contains the only harbour either on the Coromandel, or the Malabar Coasts, in which ships can moor in safety at all seasons of the year. As the whole of that large tract which we possess along the Coromandel coast presents nothing but open roads, all vessels are obliged on the approach of the monsoons to stand out into the open sea; and there are many parts of the coast that can only be approached during a few months of the year. The harbour of Trincomalée is equally secure at all times of the year: the next to this is Point de Galle: large ships, however, moor securely at certain seasons of the year, in the roads of Columbo. There are several inferior ports distributed around the island, which afford shelter

to the small coasting vessels. The rivers which intersect the island, are for the most part broad and deep, but seldom navigable for any considerable distance: as soon as they enter the mountains which cover the native kingdom of Candy, they become rocky and rapid, and tumble down with such a headlong course, that it is impossible for the smallest canoe to navigate them. The internal communication by land is bad; the roads are in many places rugged and steep, and not only difficult, but dangerous, from the numbers of wild hogs, buffaloes, and elephants, which infest them. Since the island has been in the possession of the English, the roads, however, have been greatly improved.

The most lofty range of mountains divides the island nearly into two parts, and so completely separates them from each other, that both the climate and seasons on either side are essentially different. These mountains also terminate completely the effect of the monsoons which set in periodically from opposite sides; so that not only the sea-coast, but the whole country in the interior suffers very little from these storms. Though Ceylon lies so near the equator, the climate upon the whole is more temperate than on the continent of India; this, Mr. Percival attributes to the constant sea-breezes, by which it is fanned, without being subject to the hot and suffocating land-winds, which so frequently annoy the continent. This temperate climate, however, is chiefly confined to the coast where the sea-breezes have room to circulate: in the interior, the climate is often extremely sultry and unhealthy. This inconvenience, however, says Mr. P. might be in a great degree obviated by cutting down the woods, and clearing the jungles, and draining the swamps and marshes, as has been proved by a large tract in the neighbourhood of Trincomalée, cleared and drained by colonel Champagne since it came into our possession, and thus rendered much less noxious to Europeans. The garrison has suffered very little since from the climate.

The British dominions in Ceylon, skirt the coasts quite round, so that the territories of the king of Candy are completely inclosed within a circle. Mr. Percival follows the same direction, and leads his readers completely round the island in the same course he travelled it, setting off from Trincomalée, on which

spot he first touched the shores of Ceylon. Trincomalée, from the secure retreat which its harbour affords, is of more consequence to the English government than the whole of the rest of the island; its intrinsic value is, moreover, increased by its proximity and easy access to our settlements in the Bay of Bengal; a vessel from Madras may arrive here in two days, and can at any time make the harbour. The town itself is strong, and occupies more ground than Colombo, to which it is in every other respect very much inferior.

Jaffnapatam, the northern district of the island, is the most fertile and salubrious: the violence of those hot suffocating land-winds which rage so fiercely on the continent is broken by the intervening sea, the fields are clothed with verdure, and it is here only that sheep are reared with success. The greater number of the inhabitants of Jaffna are of Moorish extraction, and are divided into several tribes known by the names of Lubbahs, Mopleys, Chittys, and Choliars: they are distinguished by wearing a little round cap on their close-shaven heads. They carry on a variety of manufactures of coarse cloths, calicoes, shawls, &c.: here are also a number of goldsmiths, joiners, jewellers, &c. Having conducted us round the northern extremity of the island, Mr. Percival stops at the Bay of Condatchy, whilst he gives us a very curious and interesting account of the pearl fishery which is carried on here. The spectacle exhibited at this season, must be inconceivably striking to an European: "several thousands of people of different colours, countries, casts, and occupations, continually passing and repassing in a busy crowd: the vast numbers of small tents and huts erected on the shore, with the bazar or market-place before each; the multitude of boats returning in the afternoon from the pearl banks; the anxious expecting countenances of the boat-owners, while the boats are approaching the shore, and the eagerness and avidity with which they run to them when arrived in hopes of a rich cargo;" the numbers of jewellers, brokers, and merchants, all busily occupied in some way or other with the pearls; tend to impress the mind, as Mr. Percival observes, with the value and importance of that object which can of itself create this scene.

"The first step, previous to the commencement of the fishery, is to have the different oyster-banks surveyed, the state of the oysters ascertained, and a report made on the subject to government. If it has been found that the quantity is sufficient, and that they are arrived at a proper degree of maturity, the particular banks to be fished that year are put up for sale to the highest bidder, and are usually purchased by a black merchant. This, however, is not always the course pursued: government sometimes judges it more advantageous to fish the banks on its own account, and to dispose of the pearls afterwards to the merchants. When this plan is adopted, boats are hired for the season on account of government, from different quarters; the price varies considerably, according to circumstances; but is usually from five to eight hundred pagodas for each boat. There are however no stated prices, and the best bargain possible is made for each boat separately. The Dutch generally followed this last system; the banks were fished on government account, and the pearls disposed of in different parts of India, or sent to Europe. When this plan was pursued, the governor and council of Ceylon claimed a certain percentage on the value of the pearls; or, if the fishing of the banks was disposed of by public sale, they bargained for a stipulated sum to themselves over and above what was paid on account of government. The pretence on which they founded their claims for this perquisite, was their trouble in surveying and valuing the banks.

"As neither the season, nor the convenience of the persons attending, would permit the whole of the banks to be fished in one year, they are divided into three or four different portions, which are fished one portion annually in succession. The different portions are completely distinct, and are set up separately to sale, each in the year in which it is to be fished. By this means a sufficient interval is given to the oysters, to attain their proper growth; and as the portion first used has generally recovered its maturity by the time the last portion has been fished, the fishery becomes almost regularly annual, and may thus be considered as yielding a yearly revenue. The oysters are supposed to attain their completest state of maturity in seven years; for, if left too long, I am told that the pearl gets so large and so disagreeable to the fish, that it vomits and throws it out of the shell."

The fishing season begins in February, and ends about the beginning of April.

"During the season, all the boats regularly sail and return together. A signal gun is fired at Arippe, about ten o'clock at night, when the whole fleet sets sail with the land breeze. They reach the banks before day-

break; and at sun-rise commence fishing. In this they continue busily occupied till the sea-breeze, which arises about noon, warns them to return to the bay. As soon as they appear within sight, another gun is fired, and the colours hoisted, to inform the anxious owners of their return. When the boats come to land, their cargoes are immediately taken out, as it is necessary to have them completely unloaded before night. Whatever may have been the success of their boats, the owners seldom wear the looks of disappointment; for, although they may have been unsuccessful one day, they look with the most complete assurance of better fortune to the next; as the Brahmins and conjurers, whom they implicitly trust, in defiance of all experience, understand too well the liberality of a man in hopes of good fortune, not to promise them all they can desire.

“Each of the boats carries twenty men, with a Tindal or chief boatman, who acts as pilot. Ten of the men row and assist the divers in re-ascending. The other ten are divers; they go down into the sea by five at a time; when the first five come up the other five go down, and by this method of alternately diving, they give each other time to recruit themselves for a fresh plunge.

“In order to accelerate the descent of the divers, large stones are employed: five of these are brought in each boat for the purpose; they are of a reddish granite, common in this country, and of a pyramidal shape, round at top and bottom, with a hole perforated through the smaller end sufficient to admit a rope. Some of the divers use a stone shaped like a half-moon, which they fasten round the belly when they mean to descend, and thus keep their feet free.

“These people are accustomed to dive from their very infancy, and fearlessly descend to the bottom in from four to ten fathom water, in search of the oysters. The diver, when he is about to plunge, seizes the rope, to which one of the stones we have described is attached, with the toes of his right foot, while he takes hold of a bag of net-work with those of his left; it being customary among all the Indians to use their toes in working or holding as well as their fingers, and such is the power of habit that they can pick up even the smallest thing from the ground with their toes as nimbly as an European could with his fingers. The diver thus prepared, seizes another rope with his right hand, and holding his nostrils shut with the left, plunges into the water, and by the assistance of the stone speedily reaches the bottom. He then hangs the net round his neck, and with much dexterity, and all possible dispatch, collects as many oysters as he can while he is able to remain under water, which is usually about two minutes. He then resumes his former position, makes a signal to those above by pulling the rope

in his right hand, and is immediately by this means drawn up and brought into the boat, leaving the stone to be pulled up afterwards by the rope attached to it.

“The exertion undergone during this process is so violent, that upon being brought into the boat, the divers discharge water from their mouth, ears, and nostrils, and frequently even blood. But this does not hinder them from going down again in their turn. They will often make from forty to fifty plunges in one day; and at each plunge bring up about one hundred oysters. Some rub their bodies over with oil, and stuff their ears and noses to prevent the water from entering; while others use no precautions whatever. Although the usual time of remaining under water does not much exceed two minutes, yet there are instances known of divers who could remain four and even five minutes, which was the case with a Caffree boy the last year I visited the fishery. The longest instance ever known was that of a diver who came from Anjango in 1797, and who absolutely remained under water full six minutes.”

The chief terror and risque of the Indians in diving, arise from falling in with the ground-shark while at bottom: this animal is a common and terrible inhabitant of all the seas in these latitudes, and a source of perpetual uneasiness to the adventurous Indian, who is always guaranteed from harm by priests or conjurers kept in pay for the occasion. If an accident happens, these fellows are singularly dexterous in accounting for it: they are known in the Malabar language by the name of *Pillal-karras*, or *binders of sharks*. Oyster lotteries are carried on to a great extent; they consist of purchasing a quantity of the oysters unopened, and running the chance of finding pearls in them: they are much encouraged by European officers.

“As soon as the oysters are taken out of the boats, they are carried to the different people to whom they belong, and placed in holes or pits dug in the ground to the depth of about two feet, or in small square places cleared and fenced round for the purpose; each person having his own separate division. Mats are spread below them to prevent the oysters from touching the earth, and here they are left to die and rot. As soon as they have passed through a state of putrefaction, and have become dry, they are easily opened without any danger of injuring the pearls, which might be the case if they were opened fresh, as at that time to do so requires great force. On the shell being opened, the oyster is minutely examined for the pearls: it is usual even to boil the oyster, as the pearl, though commonly found in the

shell, is not unfrequently contained in the body of the fish itself."

The stench occasioned by the putrid oysters corrupts the atmosphere for several miles round Condatchy, and renders the neighbourhood extremely unpleasant till the monsoons and violent south-west winds set in and purify the air.

But we have so much interesting matter before us, that we must take our leave of the pearl fishery: nothing very particular occurs to detain us until we reach Columbo, except the salt-works at Puttalon, which the Dutch pitched upon for the exclusive manufactory of that important article, with which by treaty it supplied the king of Candy's dominions. Columbo is the capital of Ceylon, and the seat of government; it is strong by nature, and strengthened by art; its population is numerous, its situation healthy, and the district depending on it extensive and fertile. When the English arrived here, they found a rack and a wheel, with a great variety of other implements of torture; these were instantly destroyed by the humanity of the British government. Columbo is one of the most populous places in India; there is no part of the world, says Mr. P. where so many different languages are spoken, or which contain such a mixture of nations, manners, and religions. The language in most general use here, both by Europeans and Asiatics, is the Portuguese of India, a base, corrupt dialect, altogether different from that spoken in Portugal. It is from this district that large quantities of cinnamon and pepper, the staple spices of the island, are yearly transported to Europe, arrack is made in great quantities, and sent to our Indian settlements, as are a variety of other articles, the produce of the island, such as betel-leaf, and areka-nut, cocoa-nut, coral, ivory, &c. A large quantity of coya-rope, or cordage, is also manufactured here, and supplies are sent to our ships on the Indian seas. In return, rice is imported, calicoes, muslins, tin, copper, &c.; and a Portuguese or Chinese ship arrives once a year from Macao with teas, sugar, sweetmeats, hams, silks, velvets, nankeens, umbrellas, straw hats, all kinds of China-ware and toys. The country for several miles around Columbo is extremely rich; the groves of cinnamon and cocoa-trees form a shade impenetrable to the fiercest sun, and afford a refreshment to the tra-

veller which no European can estimate who has not experienced it.

Pursuing his course south of Columbo, Mr. P. conducts us to Puntura; to Caltura, where certain native manufactures are carried on to a considerable extent; to Point de Galle, whose harbour we have already mentioned; and to Matura, the country around which abounds with elephants. It is here that they are principally caught for exportation; every three or four years the elephant is hunted here by order of government. In the year 1797, at one of these hunts, a hundred and seventy-six were caught, the greatest number ever remembered to have been taken at one time. From Matura, no European settlement occurs till we come to Batacolo, a distance of sixty miles, very much infested by wild beasts. From Batacolo we proceed to Trincomalée, having now, under the guidance of Mr. Percival, who is a very instructive and entertaining companion, completed a tour round the island.

Before Mr. Percival enters upon a description of the interior parts of Ceylon, which are under a different sovereign, and inhabited by people of a different appearance and customs from those on the sea coast, he gives an account of these latter. Besides the native Ceylonese, who live under the dominion of the Europeans, and are distinguished by the name of the *Cinglese*, the coasts are chiefly inhabited by Dutch, Portuguese, and Malays. The Ceylonese Dutch are represented as living almost upon gin and the fumes of tobacco; inert, stupid, ceremonious, selfish, and so callous to the feelings of humanity, as to treat their poor slaves with cruelty upon the slightest provocation, and often from mere caprice.

It cannot escape notice, that we have purposely omitted any account of the military operations of the English: the fact is that we were fearful of extending the article to an unreasonable length. The consequence of the omission has been, that we have neglected the notice of two additional traits in the character of the Ceylonese Dutch; namely, cowardice, and treachery. The capture of Columbo was effected without resistance, and as the Dutch had every advantage of situation, knowledge of the country, and formidable works, nothing can convey a more striking idea of the degraded state to which their military establish-

ments were reduced; than their suffering an enemy to advance unmolested in such circumstances. "It is only to the total extinction of public spirit, and of every sentiment of national honour," observes Mr. Percival, "that such conduct can be attributed. A thirst of gain, and of private emolument, appears to have swallowed up every other feeling in the breasts of the Dutchmen; and this is a striking warning to all commercial nations, to be careful that those sentiments which engage them to extend their dominions, do not obliterate those, by which alone they can be retained and defended." Shocking instances of their treachery are recorded in pages 129, and 161 et seq.: we could wish to forget them.

The Dutch ladies are exactly such as we should expect the wives and daughters of Dutch husbands and Dutch fathers to be; their minds, their morals, and their manners, alike coarse and uncultivated. Dirty and indelicate, the elder ladies chew the betel-leaf and areka-nut, and spit into the same pan which is employed for that purpose by the smokers!!

The present Portuguese of Ceylon are a mixture of the *spurious* descendants of the several European possessors of that island, by native women, joined to a number of Moors and Malabars. What a delectable mixture! their religion is just what it should be—a compound of Paganism and Catholicism. The complexions of this mongrel breed, of course, vary according to circumstances; jet black, sickly yellow, and tawny. They combine all the vices of the Europeans and Indians, without any of their virtues.

The Malays form a considerable proportion of the inhabitants of Ceylon; of this vindictive and ferocious race, so widely scattered over the Eastern parts of India, Mr. Percival has given a more full and characteristic account than any we recollect having elsewhere met with. Those of them who are brought up in the European colonies, contract more of the habits of civilized society, than such as remain in their original empire of Molucca, but they never become completely tame; their natural ferocity is never entirely got rid of. The men are jealous to an extreme, and the passions of both sexes are equally violent; if an European paramour offers the slightest neglect to a Malay woman, she will take a sure and terrible revenge. The Ma-

lays universally profess the Mahometan religion, and observe its ceremonies strictly: they have a peculiar fondness for gardening, and a skill in medicinal herbs is general among them. Their amusements are suited to their dispositions, and are bold, vigorous, and ferocious: they are fond of music; and having lost their last stake at gaming, will often sacrifice themselves and their lucky antagonist to their despair. In their own country, their government resembles the ancient feudal institutions of Europe; but the fierce temper arising from such institutions, which in Europe was softened by the Christian religion, has rather been exasperated by that which the Malays have embraced; they mingle no courtesy with their courage: all is ferocity, and revenge. The *kreese*, which every Malay carries about him and which descends with religious care from generation to generation, is a poisoned dagger, the blade of which is of the best tempered steel, and often made of a serpentine form, so as to inflict the more dreadful wound; the ivory handle, carved into the similitude of a man's body, with a bird's head, is their *swanny* or god, to which they make obeisance before they draw the *kreese* to execute some atrocious purpose, and which is never sheathed again till it has been drenched in blood. Before they *run-a-muck*, in order to secure themselves from the possibility of being diverted from their bloody purpose, they intoxicate themselves, and produce a desperate delirium by taking opium prepared from an herb called *bang*. In this horrible frenzy, into which a Malay works himself in the thirst of revenge for some real, or perhaps imaginary grievance, he rushes headlong into the street, and stabs indiscriminately every one who comes in his way, crying aloud *Amok, Amok*; kill, kill. The fury of the devoted wretch, says Mr. Percival, is indescribable, and the mischief he often does is very great, before a lucky shot brings him down. The cruelty and insolence of the Dutch towards their Malay slaves occasioned very frequent *mucks* in their settlements. It is with the highest pride and pleasure we learn, that since the arrival of the English at Ceylon, this barbarous practice has almost been unknown. How honourable a testimony to the humane and mild administration of the English government! The Malays are well dis-

ciplined soldiers, profoundly obedient to command, and submit without a murmur, and without a thought of revenge, to any sentence from a court-martial; it is an ordinance of their religion, to pay implicit obedience to all their officers, European as well as Malay, and to execute military orders with the strictest punctuality. Mr. Percival is of opinion, that mild and generous treatment may in time subdue their native ferocity; but the only way of radically extirpating it is, by the introduction of christianity among them.

The native Ceylonese compose the great majority of the inhabitants of the island; those under the dominion of Europeans retain their original appellation of *Cinglese*; the rest, who acknowledge the authority of their native princes alone, are called *Candians*. \*The Ceylonese, of both sexes, are remarkably clean and neat both in their persons and their houses, abstemious in their diet, and so scrupulously nice in their eating and drinking, cookery, &c. that to avoid touching with their lips the vessel out of which they drink, they hold it at some distance from their heads, and literally pour the drink down their throats. The Ceylonese are courteous and polite, charitable, honest, *for Indians*, and mild; when their anger is roused, their revenge however is mortal; and a Ceylonese has often been known to kill himself in the presence of his foe, in order that the latter, as the presumptive murderer, might suffer from it. The Ceylonese are grave and punctilious; their gravity may be derived from the gloomy superstition with which they are haunted from their cradle to their grave, and from the dispirited and oppressed state in which they have been so long kept by their tyrannous masters, the Portuguese and the Dutch. Sports and diversions seem almost unknown among them. We do not know how to reconcile their unusual continence with respect to women, with the account which immediately follows of their unbounded licentiousness, page 176, et seq. A mother makes no scruple of disposing of her daughter's favours for a small sum, to any one that desires them; and to have been con-

nected with an European is an honour which excites envy. As marriages are dissolvable at the option of either party, polygamy, though lawful, is not general, it is expensive, and not necessary. Marriages are often contracted by parents during the childhood of their children, with a view to the observance of rank, and are often dissolved almost as soon as consummated.

"It is also customary for those who intend to marry, previously to cohabit and make trial of each other's temper; and if they find they cannot agree, they break off without the interference of the priest, or any further ceremony, and no disgrace attaches on the occasion to either party, but the woman is quite as much esteemed by her next lover as if he had found her in a state of virginity.

"After the parties have agreed to marry, the first step is, that the man present his bride with the wedding-clothes, which indeed are not of the most costly kind: they consist of a piece of cloth, six or seven yards in length, for the use of the bride, and another piece of cloth to be placed on the bed. It gives us a striking idea of the total want of industry among the Ceylonese, and their extreme state of poverty, that even these simple marriage presents are frequently beyond the ability of the man to purchase, and that he is often obliged to borrow them for the occasion from some of his neighbours.

"The wedding presents are presented by the bridegroom in person, and the following night he is entitled to lie with the bride. Upon this occasion is appointed the day for bringing her home, and celebrating the wedding with festivities. On that day he and his relations repair to the bride's house, carrying along with them what they are able to contribute to the marriage feast. The bride and bridegroom, in the presence of this assembly, eat out of one dish to denote that they are of the same rank. Their thumbs are then tied together; and the ceremony concludes by the nearest relations, or the priest, when he is present, cutting them asunder. This, however, is accounted a less binding ceremony, and indeed scarcely intended for continuance. When it is desired to make the marriage as firm and indissoluble as the nature of their manners will allow, the parties are joined together with a long piece of cloth, which is folded several times round both their bodies; and water is then poured upon them by the priest, who always officiates at this ceremony although rarely at the former. After the marriage ceremony,

\* Although there are some shades of difference between the Candians and Cinglese, their characters and customs are so generally alike, that a description of the *Ceylonese* will be found sufficiently characteristic of both. In a subsequent chapter, Mr. Percival, with that care and accuracy which stamp so high a value on his work, has enumerated those circumstances which distinguish the Candians from the Cinglese.

whether the stricter or the less binding one is performed, the parties pass the night at the bride's house; and in the morning the husband brings her home, accompanied by her friends, who carry with them provisions for another feast."

When a divorce takes place, and both men and women often marry and divorce several times before they can fix on a partner for life, the woman carries with her the portion she brought, in order to make her as good a match for her next husband, "Owing to the early intercourse of the women with the other sex, for they are in general even regularly married at twelve, they soon lose the appearance of youth, and get old and haggard in their looks immediately after they pass twenty."

In Ceylon every man is his own physician: a plaster of herbs or cow-dung is the panacea; leprosy is common; and the cow-pox was not introduced at the time Mr. Percival's account was composed. The language of the Ceylonese is peculiar to the island. Mr. P. thinks it allied to the Maldivian, which race they resemble in shape, complexion, and habit. To read and write are no ordinary accomplishments among the natives of Ceylon; a sect of *learned men*, called *gonics*, are retained by the king of Candia to execute all the writings of state, and those which respect religious affairs. For writing they usually employ the leaves of the talipot-tree, which are smooth, and cut into long slips; on these they engrave, as it were, the Arabic characters, by means of a fine pointed steel pencil, like a bodkin. Palm leaves are sometimes employed, and a sort of paper is made from the bark of a tree. The progress of the Ceylonese in the other arts of life, is proportionate to their literature; their agriculture is in the rudest state; and perhaps there is no part of India, says Mr. P. where the lands are cultivated with more negligence. Mr. P. gives reasons for believing that the arts were better understood among them formerly than they are at present.

The religion of the Ceylonese is gloomy and superstitious to the very lowest degree; their whole conduct is regulated by omens; and if an astrologer declares that a child is born to misfortunes, the parents frequently anticipate its future evils by destroying it! Mr. Percival considers "the excess of trembling superstition, which unhinges the

minds of the Ceylonese," as attributable to their climate: the noise of the thunder is terrible, and the effects of the lightning dreadful; they consider these frequent storms as a judgment from Heaven, and a proof that their island is abandoned to the dominion of devils. This explanation derives plausibility from the prevalence of similar apprehensions among the Malabars and Indians, who are subject to thunder storms of equal violence. The priests profit by these superstitious fears, encourage them, and of course impede the progress of civilization.

The Ceylonese are rigid predestinarians; they believe in the immortality of the soul, and the resurrection of the body; that the souls of the just are admitted into the rank of gods, whilst those of the wicked, particularly tyrants and impious priests, are supposed to pass into wild beasts and reptiles. They worship the one Supreme Being as the creator and ruler of heaven and earth, but they have a number of subordinate deities, good and evil.

"The next in dignity to him is their god Buddou, the saviour of souls. This idea of a saviour seems in some degree to pervade every religion in the world, although tainted by a variety of different superstitions which are joined to it; and what is remarkable, the expectations formed from the interference of this saviour are in almost every religion nearly the same. Buddou, according to the most general tradition, was originally the spirit of a good man, who was again sent to revisit the earth; and after having performed a prodigious number of virtuous actions, and been transformed into a hundred and ninety-nine different shapes, reascended into heaven, and is still employed in procuring the pardon of his worshippers."

Ceylon is universally believed to have been the residence of Adam, the seat of Paradise, and on the summit of a mountain called Hamalleel, is the print of a man's foot. On this spot Adam is supposed to have taken his farewell view of Paradise, and have crossed over to the continent of India, which was at that time joined to the island; but no sooner had he passed what is to this day called Adam's-bridge, than the sea closed behind him, and cut off all hopes of return. The origin of these traditions, says Mr. Percival, I do not pretend to trace, but their connection with scriptural history is very evident; and they afford a new instance how universally the opinions with respect to the origin

of man coincide with the history of that event, as recorded in the Bible.

The priests of Buddou are called *Tirinnaxes*, and are held in such high estimation at the court of Candy, that their persons are held sacred, and the king himself has no power to punish them, even for a conspiracy against his own life; they are exempted from all taxes. They are, however, placed under certain restrictions, and are totally debarred from wine and women. Mr. Percival, however, tells us a secret, which indeed we should very probably have guessed, namely, that they find an opportunity of escaping from these restraints, and are allowed to lay aside their order when it suits their inclination. The *Tirinnaxes* are elected by the king from among the nobles, and are consequently men of independent power and influence. The priests of the inferior deities are a set of lazy impudent vagabonds, who live upon the tricks and extortions which they practise upon their credulous and deluded votaries. The christian priests and missionaries often make converts.

Notwithstanding the general similitude between the Candians and Cinglese, the independence of the former who retired from European invaders into the fastnesses of their native mountains, gives a manliness to their character, which the latter, who, from the nature of the country which they inhabited, were compelled to unconditional submission, have almost lost. In exchange, however, the Cinglese are more humanized and softened in their dispositions; they are quiet, inoffensive, gentle, and friendly, and have scarcely any of the false, treacherous, and designing arts which are often found among the Candians. The deportment of the Cinglese denotes, however, that he has been a slave to the Europeans, he is submissive, he is abject, because he is helpless. The Candians are haughty, and may justly boast of their independence: their mien is lofty, their habits are warlike; and they look upon the Cinglese as a mean and despicable race, who barter their natural rights for peace and protection.

The interior of the island, owing to the jealousy of the Dutch in the first place, and the Candians in the second, has been little explored by Europeans. The Dutch were fearful that some connection might be formed injurious to their own interests; and it was the necessary policy of the Candians to conceal

whatever might excite the avarice and rapacity of the Europeans. When General Macdowal went as ambassador to Candy, his suite were admitted only by torch-light, and always retired before break of day. Mr. P. lived on the island upwards of three years, and traversed the interior, even to the capital; but such was the vigilant suspicion of the Candians, that during the whole progress of the embassy not one female was permitted to be seen! This suspicion was excited by the conduct of the Dutch. The Candians are not jealous, but kept their females out of sight from a fear of intelligence being communicated to the Europeans. The dominions of his Candian majesty are on all sides separated from those of the Europeans, by almost impenetrable woods and mountains. All travelling is performed on foot, his majesty suffering no roads to be cut, or woods to be cleared, lest communication should be made easy. What reflections does such a prohibition excite? what are we to conceive of that system, the cruelty, rapacity, and perfidy of which could have driven the native monarch of the island, and his high-spirited mountaineers, thus to conceal themselves amidst their own impervious rocks and pathless jungles, in order to avoid being hunted down like beasts by their inexorable pursuers? There is every reason to hope and to believe, that the liberal and humane policy of the English government will in time uproot this antipathy against the Europeans.

The city of Candy itself is a poor miserable looking place, and the perseverance of the Dutch has more than once enabled them to reach it, when the monarch has been compelled to shelter himself in some still wilder and more impenetrable retreat.

The government of Candy is an absolute despotism; and any resistance to the will of the king, without power to maintain it, is sure to be attended with immediate destruction. The Candians are divided into casts, which are strictly preserved from intermixture: in the arrangement of them artificers rank before husbandmen and soldiers. This singular circumstance, says Mr. P. bespeaks a degree of civilization, and a love for the arts, which certainly do not correspond with the present state of these islanders; but, together with some architectural remains of superior taste and workmanship, which have escaped the

savages of time and the foe, indicates that the arts were more successfully cultivated, and that civilization was farther advanced in former times than it is now.

Mr. Percival devotes an interesting chapter to the nature of the Candian government, and its civil and military establishments. We must pass it over, as the most singular part of the inhabitants of Ceylon yet remain to be described, the *Bedahs* or *Vaddahs*; a race of savages who, when the Portuguese first visited the island, occupied, as they do now, the deepest recesses of its forests. The origin of this race of savages bids defiance to conjecture; they are an anomaly in the natural history of man; living upon the precarious produce of the chase, and exposed to the fury of wild beasts, they prefer this barbarous and solitary life to the luxuries of the Cinglese, and the arts of the Europeans, which they are accustomed to witness. The *Bedahs* differ from the other Ceylonese in complexion and in language; in the province of Bintan, where they are most numerous, they are completely savage, holding no intercourse with the other natives, and are rarely even seen by them; they sleep on trees, or at the foot of them, and climb up its branches when any noise alarms them, with the utmost expertness and celerity. This tribe acknowledges no authority but that of its own chief and religious men, and adhere without the slightest variation to its own laws and customs, from generation to generation. There are some few who will even traffic with the Cinglese; "but the wilder class, known by the name of *Ramba Vaddahs*, are more seldom seen, even by stealth, than the most timid of the wild animals."

"The dogs of the *Bedahs* are remarkable for their sagacity, and not only readily trace out game; but also distinguish one species of animals from another. On the approach of any carnivorous animals, or of a stranger, they immediately put their masters upon their guard. These faithful animals are indeed invaluable to them, and constitute their chief riches. When their daughters are married, hunting dogs form their portion; and a *Bedah* is as unwilling to part with his dog as an Arabian with his horse. Some time before the last war broke out between us and Holland, a Dutch officer procured a couple of these dogs, which he carried to Surat, and sold for four hundred rix-dollars.

"Those *Bedahs* who venture to converse

with the other natives, are represented to be courteous, and in address far beyond their state of civilization. Their religion is little known. They have their inferior deities corresponding to the demons of the Cinglese, and observe certain festivals. On these occasions victuals of various sorts are placed at the root of a tree, and the ceremonies of the festival consist in dancing around them."

The *Bedahs* live entirely upon the produce of the chase, and upon the fruits which grow spontaneously around them. The cultivation of the ground is an art which they never attempt to practise.

After this ample description of the island of Ceylon, and the several races of its inhabitants, Mr. Percival proceeds in plain unscientific language to give some account of its natural productions. Among the animals the elephant ranks first; those in Ceylon are produced in very great abundance, and are considered superior to any in the world.

"These lords of the forest, though from their size and strength formidable to all its other inhabitants, themselves live in continual apprehension of a small reptile, against which neither their sagacity nor their prowess can at all defend them. This diminutive creature gets into the trunk of the elephant, and pursues its course till it finally fixes in his head, and by keeping him in continual agony, at length torments the stupendous animal to death. So dreadfully afraid are the elephants of this dangerous enemy, that they use a variety of precautions to prevent his attacks; and never lay their trunks to the ground, except when to gather or separate their food."

The manner of catching elephants here differs from that practised on the continent of India, but we cannot spare room to describe it.

Neither the horse nor the sheep is a native of Ceylon: the horses generally used are a mixture of the Arab and Carnatic breeds. They are scarcely ever castrated. Indian horses are extremely spirited, and often defend their riders against the attack of other animals. "I have myself been indebted to their prowess," says Mr. P. "for my preservation from the fury of a buffalo." Two attendants are constantly attached to each horse: one follows him wherever he goes; and Mr. P. assures us, that some of these *horse-keepers* have kept up to his horse for twenty or thirty miles together, while he was proceeding at the rate of five or six miles an hour!

The oxen of Ceylon scarcely exceed

in size our calves of a year old; bullocks and buffaloes are employed in bearing and drawing burdens. These latter, which are very numerous, are fierce and rough, and extremely obstinate and untractable: to the scarlet coat they have an unaccountable antipathy, the sight of it makes them perfectly outrageous. Although Ceylon produces few domestic animals, it contains a great variety of wild ones.

The small species of tygers infest the woods; tyger cats, wild hogs, leopards, and monkeys abound; the hyena and bear are natives, but rarely met with; there are no foxes, but jackals in abundance; porcupines, racoons, armadillos, squirrels and mungoses are found here; hares are extremely numerous; but there are no rabbits.

"Varieties of deer and elks are every where met with in the woods and jungles. One species of deer is particularly calculated to attract attention. It is a very small creature, in size not exceeding our hare; it is called by the Dutch the *moose-deer*, and by the natives *gazelle*. In every thing but in size they are complete deer; and their sides are beautifully spotted, or streaked like the fallow-deer. It is usual for the natives to catch them, and bring them down in cages to our markets, where they are sold at about a shilling a piece. Their flavour is much stronger than that of the hare, and when stewed they are excellent.

"The Indian ichneumon is a small creature, in appearance between a weazel and a mungoose. It is of infinite use to the natives, from its inveterate enmity to snakes, which would otherwise render every footstep of the traveller dangerous. The proofs of sagacity which I have seen in this little animal are truly surprising, and afford a beautiful instance of the wisdom with which Providence has fitted the powers of every animal to its particular situation on the globe. This diminutive creature, on seeing a snake ever so large, will instantly dart on it and seize it by the throat, provided he finds himself in an open place where he has an opportunity of running to a certain herb\*, which he know instinctively to be an antidote against the poison of the bite, if he should happen to receive one. I was present at an experiment tried at Columbo to ascertain the reality of this circumstance. The ichneumon procured for the purpose, was first shewn the snake in a close room. On being let down to the ground, he did not discover any inclination whatever to attack his enemy,

but ran about the room to discover if there was any hole or aperture by which he might get out. On finding none, he returned hastily to his master, and placing himself in his bosom, could not by any means be induced to quit it, or face the snake. On being carried out of the house, however, and laid down near his antagonist in an open place, he instantly flew at the snake and soon destroyed it. He then suddenly disappeared for a few minutes, and again returned as soon as he had found the herb and eat of it. This useful instinct impels the animal to have recourse to the herb on all occasions, where it is engaged with a snake, whether poisonous or not. The one employed in this experiment was of the harmless kind, and procured for the purpose."

Flying foxes abound here, and rats of various descriptions. Birds are very numerous; one of the most remarkable is the honey-bird;

"So called from a particular instinct by which it discovers the honey concealed in trees. As if designed for the service of the human species, this bird continues to flutter about and make a great noise till it has attracted the notice of some person, and induced him to follow the course it points out to him. It then flutters before him, till it has led him to the tree where the bees have lodged their treasure. The man then carries off the honey, leaving a little for the use of the bird, which silently and contentedly watches till it is permitted to enjoy its reward. As soon as it has eaten up its portion, it renews its noise, and goes in quest of another tree, followed by the man, who finds a guide here provided for him by nature."

The reptiles and insects of Ceylon are exceedingly numerous, and several species of them are very little known; serpents particularly abound, to the great annoyance of the inhabitants; alligators infest the rivers, and render them very dangerous. In the year 1799, one was killed in the neighbourhood of Columbo, twenty feet long, and as thick in the body as a horse: in its belly were found the undigested head and arm of a black man. Insects abound here as in all hot countries, of every description and degree of malignity. Ceylon is particularly prolific in plants also: almost all those fruits which are peculiar to India, and the countries within the tropical climates, are found here in great abundance, and of a superior quality:

\* We regret that Mr. Percival has omitted to give us the name of this herb: so powerful and certain an antidote surely would be serviceable to man: the natives, indeed, have occasionally recourse to it. Sparmann says it is the *ophiorhiza*.—See also *Amst. Acad. tom. iv.* for a treatise on the subject by Darolius.

pine-apples, oranges, pomegranates, citrons, limes, tamarinds, &c. grow spontaneously in the woods. The following are among the most esteemed and valuable vegetable productions: Ceylon produces two species of the bread-fruit tree: one of which is specifically called the *bread-fruit tree*, and the other *jacka* or *jack-fruit*. These fruits are invaluable preservatives against famine, and are eaten by the natives with great relish. Every part of the cocoa tree is useful: Mr. Percival has given a very full and interesting account of its various qualities. The nuts of the *betel-tree* are in general use, and form a great article of trade among the natives. Ceylon, which has been so long renowned for its spices, produces several sorts of pepper: cardamoms, coffee, and the palm or *palmira* tree grow here; the leaves of this latter are used by the natives to write on; a tough whitish skin, like that found at the root of the betel leaves, covers the body of the tree, and, like it, is employed by the natives to hold their victuals, their arrack, water, &c. The *sugar-tree* is a species of palm found in several parts of the island. "It bears a flower distinguished by the variety of its colours: on cutting off the flower and making an incision in the place from which it sprung, a juice distills, which by a slight process of boiling and straining, yields as good a sugar as that extracted from the cane, and far superior to the *jaggery*." The *sugar-cane* has also been introduced into the island, and plantations of it are found in the neighbourhood of Calcutta. The *tea-plant* has been discovered native in the forests of this island, and of a quality said to be equal to any which grows in China. That experiments should be made by government in the cultivation of the two last-mentioned plants, is a matter of immediate and peremptory importance. The *talipot-tree* derives its highest estimation from its leaves, which, as we have already noticed, are used by the natives for writing.

"The leaf is completely circular, terminating in the most beautiful rays, it folds up into plaits like a fan, which in figure it nearly resembles. In size and thickness it completely surpasses almost all other leaves. The breadth of the diameter is from three to four feet, and the length and thickness is in proportion: it is large enough to cover ten men from the inclemency of the weather. It is made into umbrellas of all sizes, and serves equally to protect the natives against

the intolerable rays of the sun, and the rains which at particular seasons deluge their country. As it is of such an impenetrable texture as to defy either the sun or the monsoon, it affords a shelter even more secure than their huts. During the violent rains it is not unusual to see the natives prop up one end of a talipot leaf with a stick two or three feet long, and then creep under it for protection."

The *banyan*, the *cotton-tree*, the *tickwood*, and the beautiful *calamander*, together with that singular plant the *nepenthes*, are indigenous here: rice is cultivated on a very large scale, and constitutes the chief food of the natives. But the staple commodity of Ceylon, the most valuable and the most important article of the whole, is *cinnamon*. Mr. Percival has not suffered it to pass without that attention to which its superior value entitled it; he has given a minute account of the different sorts, and their respective qualities; of the soil best adapted to its growth; of the general appearance of the plant, the properties and uses of its various parts; the manner in which it is cultivated, barked, harvested, housed, prepared for exportation, &c. &c.; and lastly, he has suggested some hints for the improvement and extension of its culture. The chapter is altogether very interesting and important. The interior is not so well adapted for producing this plant as the loose soil about the coasts; but of late years less has been produced there than formerly, in consequence of the cruel exactions and impolitic avarice of the Dutch; who at length reduced the king of Candy to such desperation, that he resolved, says Mr. P. to secure himself against their future attacks, by leaving nothing in his dominions which could excite their covetousness. With this view, since the last treaty he was forced to make with them, he has employed every means to prevent the growth and propagation of the cinnamon tree.

We are now come to the minerals of Ceylon, which has scarcely been less celebrated for its precious stones than for its spices. In addition to the ruby, the topaz, and the diamond, are to be found the sapphire, amethyst, aquamarine, and tourmalines of various colours. Pearls have already been mentioned as forming a considerable article of revenue and traffic. Lead, tin, and iron ores are found in the interior; but to disappoint the avarice and rapacity of the Dutch, they are never wrought or applied to any pur-

pose. There are also mines of quick-silver; one was discovered in the neighbourhood of Columbo. Ceylon contains some hot-wells, the waters of which possess but few mineral qualities.

Mr. Percival concludes his account with some general observations on the state and value of this new acquisition to the British crown. Notwithstanding the excellent temperature and fertile soil of Ceylon, the Dutch were so negligent of the cultivation of the island, that it has never yet produced a sufficient quantity of rice and wheat for its own consumption. Twenty years ago the revenue of the island defrayed its own expenditure; but from the mismanagement of late years, the establishment has been a charge to the mother-country, which, indeed, easily made up the deficiency by the exportation of spices, by the profits of the pearl-fishery, and by the imposts laid on the several articles imported into Ceylon from other parts of India. There is every appearance, however, of a more prosperous policy under the English government. A system of kindness and conciliation to the Candians, as well as to the Cinglese, is adopted by the present active, intelligent, and humane governor, Mr. North; who has already pursued such measures as materially to have increased the revenue, and who certainly will receive with thankfulness those numerous and important hints for the improvement of the island, which are interspersed in the volume before us. Governor North has taken a tour round the island in person, accompanied by several gentlemen well calculated to examine its various natural productions with skill and accuracy. Roads will doubtless be cut to obviate the present difficulties of communication: forests will be cleared, and jungles stubbed, and marshes drained in those parts where the partial insalubrity of the climate arises from fogs and an obstructed circulation of air. The best sorts of cinnamon will, of course, be selected for cul-

ture, and the inferior species abandoned; the importance of attending to the tea-plant and the sugar-tree and sugar-cane, cannot possibly escape the sagacity of the governor, who will see the policy of encouraging a spirit of industry among the natives, who will impress them with a sense of the power with which he rules, by the vigour and promptitude of his measures, and of the humanity of his administration, by tempering the severity of justice with the tenderness of mercy.

Mr. Percival closes his volume with a journal of the embassy to the court of Candy under general Macdowal, in the year 1800. The object of this embassy is not unfolded; we are only made acquainted with one demand, which was urged on behalf of the British government, and peremptorily rejected: the demand was, that the king of Candy would allow a road to be made, and a communication to be opened from Trincomalée to Columbo through his territories, as it would avoid the circuitous route which letter-bags, &c. are now obliged to travel. His majesty would on no account suffer any connexion or intercourse between his subjects and Europeans—the Portuguese and Dutch are ever present in his mind. In this journal some further particulars concerning the interior of the Candian dominions are related, for which we must refer to the volume.

After the very ample review which we have taken of this work, it is unnecessary to make any general remarks on its merits. Mr. Percival writes in a plain, unstudied manner; he has collected such a body of information as is rarely to be met with in the same compass. That information, intrinsically interesting, and of peculiar value to Englishmen, since the country to which it refers has recently become a part of the British dominions, will plead our apology for the unusual length to which this article has been extended.

ART. VIII. *A Voyage in the Indian Ocean, and to Bengal, undertaken in the Years 1789 and 1790.* Translated from the French of L. DE GRANDPRE. 8vo. 2 vols. pp. 560.

M. GRANDPRE begins his book with remarkable honesty.

“I was at the Isle of France in the year 1790, with a vessel too large and too sharp for the country. Not being able to dispose of her, I resolved on a trip to Bengal, where

I hoped to find a good price and a ready market, though her construction was ill adapted to the navigation of the Ganges. But appearances being in her favour, this defect I trusted would be overlooked, and I was not mistaken.”

We have had sentimental travellers, and philosophistical travellers, and lying travellers from France: M. Grandpré is an ingenious traveller; this candid account of his business at Bengal is only to be paralleled by the honourable declaration of the peer who affirmed that he would cheat his own brother in horse flesh.

Our voyager touched at the Sechelles islands; he remarks that it is singular the islands of this little archipelago should have soundings at a great distance from shore: this he accounts for by supposing that the bases of these granite mountains have for a long succession of ages stopped the refuse and extraneous bodies which the tides and currents bring, and by this gradual aggregation formed the bank upon which the islands rise. The port and road of the Sechelles is represented as of the greatest importance to France, being at so small a distance from the Mauritius as to be able to annoy its trade, and cut off its communication with India. But the islands are valuable on other accounts. When the French had succeeded in pilfering some spice plants from the Dutch, their cultivation was attempted in the Isle of France; the trees degenerated, though under very favourable circumstances of culture; as the latitude of the Sechelles was similar to that of the Moluccas, it was thought proper to try the experiment there: a few plants were secretly set in the island of Mahé, and trusted to nature. The success was beyond expectation; the cloves and nutmegs throve well, and the cinnamon trees spread so rapidly as to cover the canton, wherever the forests did not obstruct their growth. At this time the war of 1778 broke out, the governor of the isles of France and Bourbon gave orders to destroy the plants if the English should attempt to take possession of the island. A French ship put in to water, the overseer mistook her for an enemy, set fire to the spice trees, and destroyed them all. Such was the worthy result of this Dutch policy. But the preserving power of nature prevailed; the birds had carried the seeds to the interior of the island, and they were in so promising a state when M. Grandpré saw them, that he asserts that France might derive from the Sechelles, notwithstanding their little extent, a sufficient quantity of spices for the consumption of the republic. It

seems however that the French government have neglected them, hoping to be supplied from Cayenne.

These islands produce the sea or twin-cocoa, which is peculiar to them; the fruit perfectly represents the human posteriors, and is in request through all Asia on account of its scarceness. The rice is excellent.

Some interesting circumstances occurred upon this passage.

“The tides during the south-west monsoon are so violent between the Maldivic islands and the Laccadives, that we are subject to lose our reckoning, especially if we are not able to make observations of longitude. To prevent gross errors, and that a vessel may not fall in unexpectedly with the land, which might be dangerous in the night, there is one remark to be made, which is rather of a singular nature.

“After passing the meridian of the Maldivés, and when we are between them and the coast of Malabar, there is seen on the surface of the water a great number of living serpents, floating without movement, their bodies rolled up, the head erect, and the look stedfast. They begin to appear as soon as we get within the Maldives; but they are not very numerous till we arrive at about eight or ten leagues from the coast, and their numbers increase as we approach. It is supposed, that they are forced down the rivers of the coast of Malabar, which are swelled by the abundant rains that prevail at that season, and which carry off with them whatever they meet in their passage. These floods are sometimes so considerable, that the sea is tinged by them six or seven leagues from the shore.

“Two days after losing the Manillese I have mentioned, I discovered land about six in the evening. The weather was thick and cloudy, with rain and light airs at intervals. I found myself too near the coast, and hauled my wind to stand off. I was borne by the currents with astonishing rapidity; in the evening the rain increased, and the wind fell quite calm. As, however, there was a very heavy swell, the ship rolled considerably, and the wet sails, by beating against the masts, were soon rent to pieces. It became necessary to unbend the topsails, and thus for a while to remain under bare poles, exposed to whatever heaven might please to ordain. While fresh sails were bending, I ordered the lead to be hove constantly; and I saw with pleasure, that the tide carried me on the course I wished to go as accurately as if I had been able to manage the ship.

“About eleven o'clock the swell became less, and in the course of a few minutes was completely gone: then the sea seemed on a sudden to be on fire. This phenomenon has been observed by several navigators, who

have described it. I find it impossible to give an idea of its appearance: the light does not resemble that produced by the track of a vessel and fish in phosphoric seas; it is absolutely fire, or at least appears to be so, and extends to the utmost limits of the horizon, so that the ship seems to swim on a burning ocean. The sea was gently agitated, and each undulation foamed like the waves of a river when the wind sets against the stream. It was this foam that sparkled, each small surge resembling a body of fire.

"The crew was very much terrified, and even the officers were alarmed. I explained the wonder, and told them, that it was by no means novel. I repeated what captain Cook had said on the subject, and observed to them, that this phenomenon was particularly mentioned by navigators as common near the Maldives. Wishing to prove to them still more satisfactorily that their fears were absurd, and that they had not the least danger to apprehend, the fire which they saw being nothing more, according to report, than a small phosphoric animal, I ordered a bucket of water to be drawn up and preserved till the next day, intending to examine it with them attentively. The sea appeared thus inflamed for the space of half an hour, when it wholly disappeared. The next day I enquired for the bucket of water, but it was not to be found; curiosity had fled with the fear of danger, and they preferred relying on my explanation, to giving themselves the trouble of examining what could have caused the phenomenon. To my great regret I thus lost an opportunity of making remarks on an object, which has justly excited the curiosity of the learned, and on which nothing satisfactory has yet been advanced. All that I was able to observe was, that as soon as the water was in the bucket it lost its brilliancy, and differed in no respect from its ordinary appearance."

M. Grandpré now comments upon the miserable policy of the French in India, and enters into some details respecting the fortifications of Pondicherry and Trincomale. We pass over these parts of mere local and temporary interest, and proceed to the more important subjects of his work.

For every thing relating to the languages, customs, and religion of India, the author refers us to Sonnerat. I have traversed the country, he says, with his book in my hand, and have verified his accounts. This present volume, however, contains some interesting remarks, and the following is perhaps the most important.

"I shall not treat of the different casts, that object being so well known as to render it unnecessary; but to those with which we are acquainted, there is a new one to be

added, that increases considerably, and perhaps will end one day in over-running all the rest, the Bramins excepted.

"This is the cast produced by the alliance of Europeans with the natives of every other cast: The first unions of this kind were formed by the Portuguese at the time of their brilliant conquests. The race has taken their name, and is known by it. This Portuguese filiation has not always continued white; some branches are again become black, while others have so nearly approached the European complexion, as at first sight not to be known; which is the less surprising, as the Indians, with the exception of colour, have nothing in their features to distinguish them from Europeans."

Ever remember, say the Bramins to their children, that you are born to command other men: this lesson has been inculcated in every possible form by these villainous impostors from generation to generation. Whatever exists in the universe, says the book of their law, is all the wealth of the Bramin, since the Bramin is entitled to it all by his primogeniture and eminence of birth; he is born above the world, the chief of all creatures; through the benevolence of the Bramin, indeed, other mortals enjoy life. Their very birth is a constant incarnation of Dharma, the God of justice. What created being can surpass him, with whose mouth the gods of the firmament feast on clarified butter, and the manes of ancestors on halloved cakes?

M. Grandpré reasons very absurdly respecting this cast. They were probably indebted, he says, for their ascendancy at first "to their physical powers and their arms: and they preserved it by their virtues and understanding. The consideration they still enjoy rests on a similar foundation, the knowledge they possess. It is certainly from the opinion which is formed of their virtue and sagacity, that they are placed in the first rank." Their power must indeed have been established originally by force as well as fraud; but to attribute their present rank to the opinion of their virtue and sagacity, is as philosophical as it would be to assert that the thrones of Europe are held by the same tenure. Had the author forgotten that the Bramins are a cast, and that they must maintain their power as long as they can support their detestable superstition? M. Grandpré speaks of Sonnerat: but he seems to have read that able writer to very little purpose,

for he is grossly ignorant of the Hindoo faith. He tells us, "the dogma of Brama is not without dissentients: some worship Chiven, or the bad principle." It would be impossible to exhibit more ignorance in so few words. What is meant by the dogma of Brama? If he means that all the Hindoos do not acknowledge Brama to be the chief object of their worship: the truth is, that he is so acknowledged by none, for the compleat conquest of his sect is shadowed out in the fable of his contest with Veeshnoo. So also M. Grandpré is equally mistaken in identifying the evil principle with Chiven, or rather Seeva, for as the English have written best, and laboured most assiduously upon this dark subject, their nomenclature has the fairest claim. Seeva is god the destroyer; but destruction in a system of perpetual renovation, only implies change, and has nothing in common with evil.

"In their chauderies," says the author, "the Hindoos lie down to sleep without order or distinction; if an European be present, they have the complaisance to leave him a little corner to himself." If this complaisance be explained, it means that they avoid him to escape pollution. We know no writer whose errors and ignorance deserve to be exposed with more severity than is justly due to M. Grandpré. Witness the insolence and detraction of the following passage:

"Some modern authors, and particularly the English, have made us acquainted with passages of their sacred books, their Veidam and their Ezourveidam; and in the national library at Paris is a translation of the Cormoredam. I respect the profound knowledge of these authors; I pretend not to call their honour in question; but would rather believe, since they affirm it, that the translations they give us are authentic, or at least that they think so themselves. I shall only remark, how much it is to be wished, that this sacred language of the Bramins were publicly known, that we may all be enabled to profit by the light which must result from an acquaintance with the annals of so ancient and so learned a people. I am far from wishing to throw doubts upon such supposed books of theirs as have been made known to us: my opinion, besides, would have but little weight against authorities so great; yet it appears to me, that whoever has been personally acquainted with the Bramins, and has studied their character and prejudices, must be struck with the unusual marks of confidence which the communication of such passages implies, and the

inferences to which such confidence would lead. If a person thus acquainted with them were disposed to make objections as to these passages, he might say, "The Bramins are by no means communicative; it is a point of their religion even, to conceal from all the world the knowledge of their language and their books. We must therefore suppose, that some of their chiefs, for they alone have the custody of the books and the law, have conquered the aversion they naturally entertained for foreign casts; have lost all remorse at so flagrant a renunciation of their precepts: and have chosen to risk their being excommunicated from their cast, which they value above life itself, rather than disoblige a stranger, who might have asked them for so important communications."

"I am aware, that these writings are now matters of general notoriety; that the most celebrated authors are eager to propagate them: fragments of these sacred books are printed in almost every publication; travellers have even professed to have acquired a perfect knowledge of the sanscrit language at Bengal. All this is so common, that I ought to believe it, and I do so, though these Bramins are greatly under the influence of their religion, which imposes a law upon them to conceal from us what we thus pretend to know; though a much lighter fault will subject them to the loss of their cast, a calamity which they will sacrifice every thing to avoid, or, when this has happened; to regain the privilege; though even when lost irrecoverably, the person so situated still remains invariably attached to it, and does not on that account the less completely despise all other casts; consequently, never endeavours to avenge himself by betraying his own: in short, though it were possible to believe, that, to get rid of the importunities of those who solicited them, they had entered into an agreement among themselves, to communicate merely indifferent circumstances, with the hope of being left quiet as to other matters, or had even invented what has been told us, for the express purpose of putting an end to the inquiries of Europeans, by pretending to satisfy us, and thus conceal more effectually all knowledge of their real mysteries,—in spite of all this, can I do other than believe what has been told us by so many respectable authors? But let me be suffered once more to remark, that if the communications which the Bramins have made to us be true, they must have transgressed the laws of their religion; that if they have so far betrayed their trust, they must have lost that inviolable attachment to it, which for so many ages has maintained in them the most profound secrecy upon the subject; that if the spirit of exclusion towards strangers be destroyed in them, the line of demarcation by which they were separated from the rest of the world must be destroyed; and, that if the secrets of their cast are unveiled, the respect which it has

hitherto inspired will soon be lost and annihilated."

We are then to disbelieve Sir William Jones, Mr. Halhed, and Mr. Wilkins, upon the authority of M. L. D. Grandpré, an officer in the French army, whose business in India was to sell a ship, which he knew to be unfit for the navigation of the Indian seas; and who had no other opportunities of becoming acquainted with India, than what he found while upon this knavish errand.

M. Grandpré, in deference to the Concordat, occasionally uses the language of catholicism, and gives us to understand that he is within the pale of the Gallican church, but he has been studious to discover his own private opinions, and they are such as were to be expected from a man so ignorant, and so satisfied with his own ignorance. The Jews, he tells us, were "a petty nation, of so little consequence as to have no customs of their own." So much for this gentleman's knowledge of laws and customs!

It has been well said, that there is no book, however bad, from which something may not be learnt. Believing this: for what reviewer but must, for his consolation, wish to believe it? we shall proceed, and rake for pearls.

This description of the dancing girls may form a note for the story of Ali Baba, or the Forty Thieves.

"Sometimes, during the dance, they play with Moorish poniards; an exercise at which they appeared to be expert. One of them, who was considered as eminently dextrous, was sent for one evening to the house of the Malabar chief, to dance in my presence. Seemingly some one had given her a hint; for she took infinite pleasure in frightening me with her poniards, the points of which she presented to me suddenly, turning quickly round every time she passed near me, but stopping with great precision within a finger's breadth of my breast. This movement was directed and timed by a stroke of the small cymbal which the dancing-master struck unawares at my ear, and which never failed to make me start, to the great amusement of the crowd, which this exhibition generally draws together."

The ceremony of charming snakes is described, but the attempt at solution is very awkward.

When Tavernier was in Hindostan, a juggler who exhibited before him was stopped in the midst of his performance by the English chaplain; for the good

man declared he would not suffer any thing diabolical to go on in his presence. M. Grandpré is even more credulous than the old English chaplain.

"In deceptive tricks, such as vomiting fire, pieces of flaming hemp and flax, a considerable quantity of thorns, and appearing to draw away the whole of their intestines by the mouth, and swallow them again, with other facetious performances of a similar kind, they succeed by main force, and carry the art to astonishing perfection. In these feats of strength, there is no delusion, no slight-of-hand, no deception: what we see is precisely what we think we see. One of these performances is of a nature to contradict all the laws of anatomy, and which no surgeon could believe till he had witnessed it. I have known some who were even incredulous after they had seen it, and who refused to trust the evidence of their eyes.

"An Indian, naked like his fellows, with no muslin round him, nor any clothing whatever to serve a sa cloak and facilitate deception, takes a sword, the edge and point of which are rounded off and blunted, and putting it into his mouth, buries it completely, all but the hilt, in his throat and intestines.

"I have observed some of these men from whom the momentary irritation caused by the insertion of this strange body has forced tears; others to whom it gave an inclination to cough, which, as they were not able to satisfy it, obliged them to withdraw the blade instantly, to prevent suffocation. In fine, when the sword has entered as far as it can, to the depth of more than two feet, they fix a small petard to the hilt, set fire to it, and bear its explosion: they then draw out the sword, which is covered with the humidity of the intestines.

"I know that a fact of such description will be regarded by readers in general as a fable, to which they conceive they should give no credit. At this I shall not be surprised: till I had seen it I refused myself to believe it; but I was under the necessity at last of yielding to the force of evidence."

In the construction of large buildings, the Hindoos supply the want of mechanical knowledge by a singular substitute. When the first row of stones is raised, they throw up a slope of earth, up which the stones are rolled for the second row; and thus they go on burying the edifice as it rises. M. Grandpré speaks of the French Jesuits in Hindostan. We did not know that the Jesuits existed any where as a body.

Calcutta is described as disgustingly filthy: dead animals are left to putrefy in the streets; and even the wretches who perish in the streets from want or

sickness, are suffered to remain there till the jackalls devour them. Surely this more resembles an account of an Abyssinian than an English city. Birds as well as beasts of prey infest Calcutta. M. Grandpré lost his dinner one day by one of these visitors. The cook was bringing a roasted fowl across the yard, and an eagle helped himself to the whole.

Having sold his ship, M. Grandpré made a speculating voyage to Mocha. This place he describes as having at first sight very much the appearance of a Spanish town, on account of the latticed balconies to every story. The religion of Mohammed exists here in full vigour of ignorance and intolerance. No foreigner is permitted to pass through one of its entrances, which is called the Sacred Gate: should he attempt it he would probably be slain by the Bedouins who are encamped by it. The very children when they see an European in the streets, run after him, exclaiming, the Frank to the burying-ground! So deep a hatred has been generated by their struggle with the Portuguese.

Upon these people M. Grandpré philosophizes with his usual wisdom and consistency.

"History shows us, that the succession of barbarism to more enlightened times, only compelled the arts and sciences to make the tour of the globe; and, in inquiring into the causes of their decline, we are obliged to admit, that the revolutions which overturn states are brought about solely by the extinction of religion and morals.

"In the enjoyment of a happier destiny, Arabia, instead of apprehensions of revolution, sees the period approaching when she will occupy in her turn the foremost place among the nations of the earth. Her attachment to her religion subsists in all its force; her morals are uncontaminated; she knows neither debauchery, gaming, luxury, nor avarice, and is perhaps the only country in existence where virtue is practised for its own sake."

What the religion of this country is, where "virtue is practised for its own sake," the reader has already seen. Let us now examine their morals, as M. Grandpré himself delineates them. The Arab, he says, is passionate and vindictive; nothing can stifle his desire of revenge; he will readily sacrifice himself, if he can involve his enemy in his destruction. Every man is capable of sacrificing his wife on the slightest suspicion; and with that disgraceful jealousy

which can only have originated in the most disgraceful lasciviousness, they will not permit their own children to enter their haram, after they have attained the age of puberty! These are the people, who, according to M. Grandpré, stand in no need of a general reformation, while they preserve their religion and manners! these are the only people in existence who practise virtue for its own sake!

On his return to the coast of Malabar a violent storm arose; his vessel leaked, and the pumps were out of order: the expedient by which he contrived to make one of them work, we shall transcribe for its ingenuity, and use his own words, for the instruction of those seamen into whose hands this book may fall.

"The pumps work by two valves, one fixed upon a moveable body called the upper box, containing a hole which this valve hermetically closes, and the other fixed to an immoveable body called the lower box. The upper box, in descending, presses the column of water upon the valve of the lower box, and keeps it shut, while the same pressure raises the valve of the upper box, and gives a passage through it to the water. In the re-ascent of the upper box, when its valve shuts by the weight of the column of water above it, that of the lower box opens and affords a passage to the water below it, which is thus drawn up by the suction. It thus appears, that the effect of the pump depends on the operation of the valves, and that without valves it could not be worked. These, however, we had lost; yet I contrived notwithstanding to put my pumps into a condition for working. I had to find the means of supplying the loss of the valves, and to substitute something which would answer their purpose; that of completely stopping the holes of both the boxes, agreeably to the action of the pump. To effect this, I heated two four-pound shot, and applied them red-hot to the mouths of the valves, where I let them burn the wood so as to bury themselves half-way in it; I then cooled them, and without any other preparation put them into the pump. Their weight did not prevent them from giving way to the water, as much as was necessary, both in the ascent and descent of the upper box; and these two motions acting successively upon them, brought them back to their position in the holes which they had burnt, and which of course they exactly filled. By this contrivance the pump worked as well as ever."

The method by which the Hindoos raised his vessel in order to repair it, is equally ingenious. They dig a bason near the water side, of a fit size to con-

tain the ship, open the dam at low water, and float it in with the tide; the dike is then closed; the next labour is to fill the bason to the brim by baling in water. The dam is then raised, and filled and raised alternately, till the vessel floats at the height required; they then fill the bason with earth, by which means the water rises above the dam and runs off, and the vessel is left bedded in soft mould: this they drain by holes at the bottom, and leave it for six weeks or two months, till they judge the earth to have acquired a sufficient solidity. They then dig round the vessel, placing supports and stocks as they go on, till they have cleared

all the earth away, and left the ship so propped that they can repair her bottom.

The useful information contained in this work might have well been comprised into an article for a magazine, where it would have appeared more respectably than in the large type of two thin volumes. The prints are very worthless; dresses indifferently delineated, and views of European buildings in Hindostan, not of the buildings of the country, for they would have required more skill than was necessary to describe the straight lines of common masonry.

ART. IX. *The History of New South Wales; including Botany Bay, Port Jackson, Paramatta, Sydney, and all its Dependencies; from the original Discovery of the Island; with the Customs and Manners of the Natives, and an Account of the English Colony, from its Foundation to the present Time.* By GEORGE BARRINGTON, Superintendent of the Convicts. 8vo. pp. about 500.

*An Account of a Voyage to New South Wales.* By GEORGE BARRINGTON, Superintendent of the Convicts. To which is prefixed a Detail of his Life, Trials, Speeches, &c. 8vo. pp. 470.

THE publisher of these books has, with great propriety, attributed them in the title-page to a pickpocket; since the former is for the most part a piracy of Captain Collins's History of New South

Wales, and the latter of Mr. Barrow's Account of the Cape of Good Hope, and Sir G. Staunton's History of the British Embassy to China.

ART. X. *Travels of Four Years and a Half, in the United States of America, during 1798, 1799, 1800, 1801, 1802. Dedicated by Permission to Thomas Jefferson, Esq. President of the United States.* By JOHN DAVIS. 8vo. pp. 454.

MR. DAVIS has misnamed his book, it is rather the memoirs of his own life in America, than the history of his travels there. Such a title indeed would have attracted little attention, for who is John Davis? The vanity of self-biography never fails to excite the sarcasm and contempt of those, who themselves indulge a far less pardonable vanity; who, being by nature inferior, counteract the painful consciousness of inferiority, by looking in every man, and in every author for his faults, nor is this author's account of himself such as will conciliate the favour of the world; he went to America to be "the architect of his own fortunes." He was an adventurer, an itinerant schoolmaster; add to the crime of poverty that he is a man of genius, and that he knows his own worth, and it will be evident that Mr. Davis is guilty of every thing that can provoke envy, hatred, malice, and uncharitableness.

On his arrival at New York, Mr. Davis found his letters of recommendation

useless. He became acquainted with a friendly bookseller, and obtained a present supply, and some reputation, by translating Bonaparte's campaign in Italy. In the infant state of American literature, such was the celebrity of this translation, that Mr. Burr, the present vice-president of the United States, sought out the writer in his obscure lodgings, and invited him to his house.

From New York the traveller soon removed to Philadelphia; the character of the hotels in that city is well introduced.

"Mr. Pecquet received me with a bowing mien, and called Jeannette for the passepartout to shew me his apartments. He exercised all his eloquence to make me lodge in his hotel. He observed that his house was not like an American house; that he did not in summer put twelve beds in one room; but that every lodger had a room to himself, and Monsieur, added he very solemnly, "Ici il ne sera pas necessaire de sortir de votre lit, comme chez les Americains, pour aller a la fenetre, car Jeannette

n'oublie jamais de mettre un pot de chambre sous le lit."

Here the yellow fever broke out. One evening, Mr. Davis had met an acquaintance in the street.

"I accompanied him, he says, into Arch-street, where taking possession of the porch of an abandoned dwelling, we sat conversing till a late hour. The most gloomy imagination cannot conceive a scene more dismal than the street before us: every house was deserted by those who had strength to seek a less baneful atmosphere; unless where parental fondness prevailed over self-love. Nothing was heard but either the groans of the dying, the lamentations of the survivors, the hammers of the coffin-makers, or the howling of the domestic animals, which those who fled from the pestilence had left behind, in the precipitancy of their flight. A poor cat came to the porch where I was sitting with the doctor, and demonstrated her joy by the caresses of fondness. An old negro-woman was passing by at the same moment with some pepper-pot\* on her head. With this we fed the cat that was nearly reduced to a skeleton; and prompted by a desire to know the sentiments of the old negro-woman, we asked her the news. God help us, cried the poor creature, very bad news. Buckra die in heaps. By and bye nobody live to buy pepper-pot, and old black woman die too."

What a picture! the effects of pestilence have never been so well delineated since Daniel Defoe's history of the plague of London.

Leaving Philadelphia to escape from this dreadful visitation, the author sailed for Charlestown, and for a short time officiated there as assistant tutor in the college. His next removal was to undertake the tuition of a wealthy planter's children, at Coosohatchie, a village about half way between Charlestown and Savannah, consisting of a blacksmith's shop, a court-house, and a jail. The sesquipedalian deformity of American names was well noticed in a paragraph which Mr. Davis quotes from the *Aurora gazette*; "Exult ye white hills of New Hampshire, redoubtable Monadnock and Tuckaway! Laugh ye waters of the Winiscopee and Umbagog lakes! Flow smooth in heroic verse ye streams of Amoriosack and Androscoggin, Cockhoka and Coritocook! and you Merri-Merrimack be now more merry." Yet these barbarous and wiggam names are far better than the mean and ridiculous appellations with which

Englishmen so often nick-name the objects of nature; one of the highest mountains in the island is called the *Cobler*, and in one of our finest lakes we have *Shoulder-of-Mutton Bay*. A similar name is introduced very happily by Mr. Davis. After walking a mile and a half, I met a boy sauntering along, and whistling, probably, for want of thought. "How far my boy," said I, "is it to *Frying Pan*." You be in the pan now, replied the oaf. "I be, be I, said I; very well." On the Indian words he writes with feeling.

"In journeying through America, the Indian names of places have always awakened in my breast a train of reflection; a single word will speak volumes to a speculative mind; and the names of Pocotaligo, and Coosohatchie, and Occoquan, have pictured to my fancy the havoc of time, the decay and succession of generations, together with the final extirpation of savage nations, who, unconscious of the existence of another people, dreamt not of invasions from foreign enemies, or inroads from colonists, but believed their power invincible, and their race eternal."

Of the treatment of slaves in South Carolina, Mr. Davis has communicated some interesting particulars. *Negur day time* is the term these poor wretches have for night, because they are then at leisure.

"It is indeed grating to an Englishman to mingle with society in Carolina; for the people, however well-bred in other respects, have no delicacy before a stranger in what relates to their slaves. These wretches are execrated for every involuntary offence; but negroes endure execrations without emotion, for they say, when Mossa curse, he break no bone. But every master does not confine himself to oaths; and I have heard a man say, By heaven, my Negurs talk the worst English of any in Carolina: that boy just now called a bason a round-something: take him to the driver! let him have a dozen!"

"Exposed to such wanton cruelty the negroes frequently run away; they flee into the woods, where they are wet with the rains of heaven, and embrace the rock for want of a shelter. Life must be supported; hunger incites to depredation, and the poor wretches are often shot like the beasts of prey. When taken, the men are put in irons, and the boys have their necks encircled with a "pot-hook."

"The Charlestown papers abound with advertisements for fugitive slaves. I have a curious advertisement now before me—

\* Tripe seasoned with pepper.

"Stop the runaway! Fifty dollars reward! Whereas my waiting fellow, Will, having eloped from me last Saturday, without any provocation, (it being known that I am a humane master) the above reward will be paid to any one who will lodge the aforesaid slave in some jail, or deliver him to me on my plantation at Liberty Hall. Will may be known by the incisions of the whip on his back; and I suspect has taken the road to Cosoohatchie, where he has a wife and five children, whom I sold last week to Mr. Gillespie."

A. LEVI.

Yet in this country where even the women exercise the most detestable cruelty, they usually give their children to be suckled by negro-women. It is not uncommon, we are told, to hear an elegant lady say, Richard always grieves when Quasheebaw is whipped, because she suckled him! What a perversion of all natural affection is here! The child is to be taught to harden his heart against the cries of her who suckled him!—What hope is there of the man? We have felt it our duty to select and dwell upon these circumstances, in the hope and belief that no good man can peruse them without indignation. The cause of the abolition is not yet to be abandoned. England indeed may resolve upon it too late, for the work of retribution is begun.

We will turn to more cheerful topics, to the delineation of natural objects.

The mocking-bird is the pride of the American woods; it is perfectly domestic, and the natives hold it sacred.

"But there is a bird called the loggerhead that will not bear passively its taunts. His cry resembles clink, clink, clank; which, should the mocking-bird presume to imitate it, he flies and attacks the mimic for his insolence. But this only incurs a repetition of the offence; so true is it that among birds as well as men, anger serves only to sharpen the edge of ridicule. It is observable, that the loggerhead is known to suck the eggs of the mocking-bird, and devour the young ones in the nest."

When weary of mocking others, the bird falls into its own strain, and so joyous a creature is it, that it will jump and dance to its own song; by day and by night it sings alike. The author was listening to one by moonlight that usually perched within a hundred yards of his log-hut. A negro was sitting on the threshold of the next door, smoking the stump of an old pipe. "*Please God Almighty,*" exclaimed the old woman,

*"how sweet that mocking bird sing! he never tire!"*

"Eagles were often seen on the plantation. The rencounter between one of them and a fish-hawk is curious. When the fish-hawk has seized his prey, his object is to get above the eagle; but when unable to succeed, the king of birds darts on him fiercely, at whose approach the hawk, with a horrid cry, lets fall the fish, which the eagle catches in his beak before it descends to the ground."

The writer of this article has seen the same thing happen in a contest between two sea-birds for their prey. Mr. Davis has given us but few observations on natural history: a study, which, he says, he has ever considered subordinate, when compared to that of life. This undue depreciation of a most interesting pursuit is to be regretted, because this author evidently possesses a quick and observant eye, and those ever-wakeful talents that could enliven any science. He disbelieves the tales of the fascinating power attributed to the eye of the snake, accounting by fear for the effects said to be so produced. It is well known, he says, that birds will flutter their wings, and exhibit the utmost agitation at the approach of a fox near the tree on which they are perched. There is a reprehensible petulance in the manner wherewith Mr. Davis asserts, that this fact could not escape the observation of any man, who, incited by the desire of knowledge, has made a tour into the country, and that it must be known to every one who has not passed his life in the smoke of London, Salisbury, or Bristol. Foxes are not such common animals that every traveller should see them at the foot of a tree. We will venture to affirm, that a man may walk from one end of England to the other, and not see a fox during the whole journey, unless there be a pack of hounds at his heels.

Once the traveller saw a negro-woman quiet her child by shaking the rattles of a snake. These little traits which the painter or the poet would have seized, he has seldom overlooked; he tells us of the long and beautiful moss, that spreading from the branches of one tree to those of another, extends through whole forests. This moss, when dried, serves many useful purposes: it is sold at Charlestown to stuff mattresses and chairs; the hunters always use it for wadding. The axe of the negro chop-

ping wood is noticed as a sound delightful to the foot traveller in America, for it lets him know some human habitation is near. The following picture has evidently been sketched from nature.

"My recreation after school in the evening was to sit and meditate before my door, in the open air, while the vapours of a friendly pipe administered to my philosophy. In silent gravity I listened to the negro calling to his steers returning from labour, or contemplated the family groupe on the grass-plot before the dwelling-house, of whom the father was tuning his violin, the mother and daughters at their needles, and the boys running and tumbling in harmless mirth upon the green. Before me was an immense forest of stately trees; the cat was sitting on the barn-door; the fire-fly was on the wing, and the whip-poor-will in lengthened cries was hailing the return of night.

"I was now, perhaps, called to supper, and enjoyed the society of Mr. Ball and his family till the hour of their repose, when I returned to my log-hut, and resumed my pipe before the door. The moon in solemn majesty was rising from the woods; the plantation-dog was barking at the voices of the negroes pursuing their nightly revels on the road; while the mocking songster mimicked the note of every bird that had sung during the day."

The poetry with which the volume is interspersed is very inferior to the prose. It is introduced with peculiar impropriety, in the history of captain Smith and the female Indian Pocahontas. This history, Mr. Davis assures us, has been related with an inviolable adherence to truth, every circumstance being rejected that had not evidence to support it: but by attributing his own verses to one of the personages, he has given a character of fiction to a story which was in itself too romantic to be believed without a solemn affirmation of its authenticity. For this very interesting tale we must refer to the volume itself. One Indian scene which the author himself witnessed our limits will permit us to notice.

On the north bank of the Occoquan, is a pile of stones heaped upon the grave of an Indian warrior. The Indians who pass near never fail to turn from the main road into the woods and visit this grave, and if a stone be thrown down, they religiously restore it to its place. A party, while the author resided at Occoquan, came to this spot; it consisted of an elderly chief, twelve war captains, and two squaws, the younger a girl of seventeen, her person remark-

ably fine, and with a profusion of raven hair.

"When I saw the squaws a second time, they were just come from their toilet. Woman throughout the world delights ever in finery; the great art is to suit the colours to the complexion.

"The youngest girl would have attracted notice in any circle of Europe. She had fastened to her long dark hair a profusion of ribbons, which the bounty of the people of Occoquan had heaped upon her; and, the tresses of this Indian beauty, which before had been confined round her head, now rioted luxuriantly down her shoulders and back. The adjustment of her dress one would have thought she had learned from some English female of fashion; for she had left it so open before, that the most inattentive eye could not but discover the rise and fall of a bosom just beginning to fill.

"The covering of this young woman's feet rivetted the eye of the stranger with its novelty and splendour. Nothing could be more delicate than her *moccasins*. They were each of them formed of a single piece of leather, having the seams ornamented with beads and porcupine quills; while a string of scarlet ribbon confined the *moccasin* round the instep, and made every other part of it sit close to the foot. The *moccasin* was of a bright yellow, and made from the skin of a deer.

"Of these Indians, the men had not been inattentive to their persons. The old chief had clad himself in a robe of furs, and the young warriors had blacked their bodies with charcoal.

"The Indians being assembled round the grave, the old chief rose with a solemn mien, and, knocking his war-club against the ground, pronounced an oration to the memory of the departed warrior.

"Here rests the body of a chief of our nation, who, before his spirit took its flight to the country of souls, was the boldest in war, and the fleetest in the chase. The arm that is now mouldering beneath this pile, could once wield the tomahawk with vigour, and often caused the foe to sink beneath its weight. (*A dreadful cry of whoo! whoo! whoop! from the hearers.*) It has often grasped the head of the expiring enemy, and often with the knife divested it of the scalp, (*a yell of whoo! whoo! whoop!*) It has often bound to the stake the prisoner of war, and piled the blazing faggots round the victim, singing his last song of death. (*A yell of whoo! whoop!*) The foot that is now motionless, was once fleetest than the hart that grazes on the mountain; and in danger it was ever more ready to advance than retreat. (*A cry of whoo! whoo! whoop!*) But the hero is not gone unprovided to the country of spirits. His tomahawk was buried with him to repulse the enemy in the

field; and his bow to pierce the deer that flies through the woods.

"No orator of antiquity ever exceeded this savage chief in the force of his emphasis, and the propriety of his gesture. Indeed, the whole scene was highly dignified. The fierceness of his countenance, the flowing robe, elevated tone, naked arm, and erect stature, with a circle of auditors seated on the ground, and in the open air, could not but impress upon the mind a lively idea of the celebrated speakers of ancient Greece and Rome.

"Having ended his oration, the Indian struck his war-club with fury against the ground, and the whole party obeyed the signal by joining in a war-dance;—leaping and brandishing their knives at the throats of each other, and accompanying their menacing attitudes with a whoop and a yell, which echoed with ten-fold horror from the banks of the river.

"The dance took place by moon-light, and it was scarcely finished, when the chief produced a keg of whiskey, and having taken a draught, passed it round among his brethren. The squaws now moved the tomahawks into the woods, and a scene of riot ensued. The keg was soon emptied. The effects of the liquor began to display itself in the looks and motions of the Indians. Some rolled their eyes with distraction; others could not keep on their legs. At length, succeeded the most dismal noises. Such hoops, such shouts, such roaring, such yells, all the devils of hell seemed collected together. Each strove to do an outrage on the other. This seized the other by the throat; that kicked with raging fury at his adversary. And to complete the scene, the old warrior was uttering the most mournful lamentations over the keg he had emptied; inhaling its flavour with his lips, holding it out with his hands in a supplicating attitude, and vociferating to the bye-standers *Scuttawawbah!* *Scuttawawbah!* More strong drink! More strong drink!"

Among the Americans present at this scene, was a young man of gigantic stature, a head taller than any of the others; the old Indian eyed him, and at length rose and shook him by the hand.

Washington is yet in an infant state: when the multitude who had assembled at Mr. Jefferson's inaugural speech had returned home, our traveller describes the city as affording no objects, but a forlorn pilgrim forcing his way through the grass that overruns the streets, or a cow ruminating on a bank, having round her neck a bell, that she might be found in the woods. The streets are most inelegantly denominated: East first street, West first street, North A street, South A street. A wag, says the author,

would infer that the one were named by a pilot, and the other by an alphabetical teacher. It has been said that Tiber was the original name of the river that supplies this city with water, and of course the coincidence flattered American patriotism: but in reality the people of Washington themselves know it in general by no other name than Goose Creek. Between the capitol and president's house, a well, which had been dug to the depth of eleven feet, immediately overflowed, and has continued to overflow.

We are sorry to see the character of Franklin studiously depreciated by Mr. Davis. The plagiarisms which he has so dramatically noticed, have been before detected; and it should have been remarked, that, in both instances, Dr. Franklin improved upon his originals. To Franklin, says this author, must we look for the source of the sordid economy of the American commonwealth. "It was he, who, by diffusing the maxims of Poor Richard, made the government of the United States a miserly body-politic." We should have thought that Mr. Davis had travelled in America to better purpose than to have brought back opinions like these, which can come with consistency from none but the state-leeches, the blood-suckers of the commonwealth: from such as share the peculations of M. Talleyrand, or divide the cheese-parings and candle-ends here at home. If the economy, the dignified and honourable economy, of the American government be indeed attributable to the lessons of Benjamin Franklin, a yet higher fame is due to that great man than he has obtained by "arresting the lightning, and breaking the iron rod." Let him who sneers at the frugality of the United States, turn to the Red Book and the Tax-Tables for 1803.

Too much of this volume is occupied with the letters of the author's friend, Mr. George; they are probably not published without the writer's knowledge, yet we think they represent him in no very favourable light. Mr. Davis himself seems to have been frequently amusing himself with Rousseau, when he would have been more wisely and healthily employed in studying Epictetus.

The volume concludes with the author's voyage home, dramatically related, and in as seaman-like a manner as ever delighted a sailor in the prose of Smol-

let; or the 'verse of Falconer. We believe there is not a *lubberly* phrase to be found in it. In some parts perhaps it is exclusively calculated for a seaman's taste.

It were needless to dwell upon the merits of this volume, after the extracts which have been adduced to exemplify them. Yet, to use the words of our old and delightful poet, W. Browne of Ottery,

I do bear this mind,  
That wheresoe'er we true deserving find,  
To give a silent praise is to detract.

ART. XI. *Journals of Travels in Parts of the late Austrian Low Countries, France, the Pays de Vaud, and Tuscany, in 1787 and 1789.* By LOCHART MUIRHEAD, A. M. 8vo. pp. 410.

MR. MUIRHEAD's preface is somewhat stately,

"To mark the occurrences of a journey is no unpleasing or unprofitable exercise. Succession of objects at once quickens and multiplies our conceptions; whilst a desire to register new appearances agreeably beguiles the ennui of monotonous motion, of lounging at inns, and of waiting upon waiters. Future leisure may give to hurried notes the regular form of diaries. These we peruse with interest—perhaps, with strange emotion, at distant and vacant hours. A single line may, not unfrequently, revive some faded impression, or recall, in all the fondness of regret, the sensations of delight or melancholy that are past. The narrative may attract the attention, or awake the feelings of a friend, or impart instruction or amusement to a fellow-creature.

"The continent of Europe, it is true, has been often traversed, and often described, but is, by no means, so exempt from vicissitude, that the accounts of one generation should preclude those of another.—Besides, extended tracts of territory, adapted to the systems of modern society, involve such a complication of detail, that the tourist is usually content to select those observations which most readily present themselves, or which are most congenial to his taste or habits of thinking. Hence, a complete picture of one country has never, perhaps, been exhibited to another, and hence, each traveller, though he should add much, may leave more to be added. In proportion, too, as we accumulate remarks on foreign parts, we enable the philosopher to widen his basis of comparisons and inductions, to correct and modify his statements, and thus, gradually to approach to truth.

"The imperfections, then, not the subject, of the following pages, require to be prefaced in the language of apology."

The same studied and sententious

We have read the book with pleasure, and shall with pleasure recur to it. It appears in the course of the volume, that Mr. Davis once designed to publish his voyages to the East Indies: we hope he will resume and compleat that intention, for possessing as he does the eye that can see nature, and the heart that can feel nature, we doubt not that it is in his power to produce a work that would interest and instruct the public.

style characterizes the journal. We like the author better when he relaxes.

Mr. Muirhead landed at Ostend. He describes neatly the first foreign costumes that excite his attention.

"As I awaited dinner in the coffee-room, two boys, apparently of twelve or thirteen years of age, wrapt in warm surtouts, took their seats with great composure, and called, in Flemish, each for his tobacco-pipe and tumbler of punch. Like grave loungers, they conversed, smoked, and tipped, without attracting the attention or ridicule of any in the room, except of the *nouveau débarqué*.

"Having been recommended to Mons. B. I did myself the pleasure of waiting upon him in the evening, and found him writing *en robe de chambre* in a counting-room, hung with old arras, and divided by antique screens. These are trifling circumstances, but mark a country which is not British."

The common style of building in Flanders, houses having their ends to the street, with arched gateways, may still be traced, he observes, in some of the decayed towns of Scotland, formerly connected by trade with Bruges and Antwerp. Ostend wants water: it is either supplied from rain cisterns, or with what is brought in casks from a considerable distance. Mr. Muirhead regrets, that the sum expended upon its fortifications had not been bestowed upon water-conduits; or that the king of the Romans had not constructed an aqueduct. Every little city of the Romans had its aqueduct, and many a one continues, at this day, to be most essentially useful, where every other monument of their empire has disap-

peared. The fortifications of Ostend had been removed, by order of the emperor, who, says Mr. Muirhead, has taken a dislike to forts and monasteries. Happy was it for the Flemings, that their towns were dismantled before the French revolution! They have now followed the fate of a battle, and escaped all the aggravated misery of sieges, assaults, and blockades. Of those evils, Ostend has had its share.

"The memorable siege of three years, three months, three weeks, three days, and three hours, was attended with the dreadful loss of 130,000 lives! When the place at length surrendered, it was a heap of ruins. So, we may presume, was the smock of Isabella Eugenia, governess of the Low Countries, who rashly vowed not to change it during the siege. The compliant ladies of the court, *horresco referens*, followed her example!"

The town's motto is, *OSTENDE nobis, Domine, misericordiam tuam*. May the prayer be heard, says the traveller, in spite of the pun; and may the Lord deal more piteously with the good burghers, than their custom-house deals with strangers.

From Ostend he went, by the canal, to Bruges and Ghent. The former of these towns is in a wretched state of decline.

This was the birth-place of Simon Stevin, the inventor of sailing chariots, whose grave Mr. Shandy would have visited. They ran at the rate of four Dutch leagues an hour. Grotius wrote a poem in honour of the discovery. Mr. M. merely passed by Ghent, not having leisure to survey it. At Brussels he remained some time, and has accordingly described the city. Among its wonders, he notices

"The little gentleman yeleft *manneke pisse*, who performs unceasing duty, and *sans façon*, to the great edification of the good burghers. The French soldiers in 1747, rudely profaned this diuretic palladium, and silenced the indignant murmurs of the inhabitants: but Lewis XIV. with laudable magnanimity, commanded that the person of the darling dwarf should be held sacred, arrayed in costly apparel, and dubbed a knight of his own order. The chevalier still appears in full uniform upon gala days; and, to such a degree has he become the *man of the people*, that his removal or mutilation might excite an insurrection. *Vive donc le manneke!*

"The grand Beguinage, an assemblage of houses, surrounded by a wall, might accommodate 700 or 800 Beguines, though

they reckon at present scarcely half that number. This community is peculiar to the Low Countries, yet seems admirably adapted to the system of modern society, whether among catholics or protestants. The Beguine brings along with her the means of her maintenance, if she possesses them, may regulate her own menage, or join her stock to that of a particular company. The superior presides in matters of general discipline, and all attend upon the stated exercises of devotion: but most of the day is spent in the varied and elegant occupations of female hands. Any individual may retire from the sisterhood, when she pleases, mingle again with the world, and enter into the married state.—The comparative fewness of ladies of easy virtue in several of the Flemish towns has been ascribed, and perhaps justly, to this salutary institution."

The men of Brabant are said to have a boyish uniformity of features: they are listless and indolent. In Brussels, they even yoke dogs to wheel-barrows and small sledges; a pitiful shift to save trouble, and avoid paying toll. History has, however, says our traveller, stamped one decided lineament of the political character of the Netherlands, namely, their extreme sensibility to any infringement of their civil or religious institutions. This is true: it might have been remarked also, that in their interior wars, they have always displayed a brutal ferocity and wicked cruelty, unparalleled in the history of any European nation, except France.

From Brussels he travelled to Lausanne. Of the anecdotes suggested by the road, the following are the most remarkable:

"Duval relates, that he saw in the prison of Nancy, friar John, a hermit of Lorraine, who, in imitation of Jesus Christ, abstained from aliment during 40 days, or rather from solid food, for it is allowed that he drank water. In one of his paroxysms of insanity he killed a man whom he deemed importunate, and had his sentence of death commuted into perpetual confinement. Being seized with an insatiable curiosity to examine the internal structure of his body, and having made a large incision with a piece of glass, he was proceeding to contemplate the viscera with great composure, when a surgeon luckily interfered, and, with some difficulty, succeeded in healing his wounds."

"The adventures of the abbé de Vatterville are so singular, and so little known, that I am tempted to trace their outline. He was brother to baron de Vatterville, once ambassador at the court of London. The abbé, when colonel of the regiment of Burgundy, in the service of Philip IV.

of Spain, evinced his courage by repeated actions of éclat. Chagrined, however, with neglect of promotion, he resigned his commission, and retired into the convent of Carthusians, at Besançon. As his restless spirit could ill brook the gloom and silence of a cloister, he appointed a confidential friend to wait for him, with a horse, without the garden wall, and secretly procured of his relations some money, a riding-dress, a case of pistols, and a sword. Thus equipped, he stole, during the night, from his cell, into the garden, stabbed the prior, whom he met on his way, scrambled over the wall, and rode off at full speed. When his horse could advance no further, from fatigue and hunger, he alighted at an obscure inn, ordered all the meat in the house to be got ready, and sat down to dinner with the utmost composure. A traveller, who arrived a few minutes later, politely requested that he might be allowed to share with him. Vatteville rudely refused, alleging that there was little enough for himself, and, impatient of contradiction, killed the gentleman on the spot with one pistol, and presenting the other to the landlady and waiter, swore he would blow out their brains if they once dared to interrupt his repast. Having thus escaped with impunity, he encountered various fortunes, landed, at length, in Turkey, assumed the turban, received a commission in the army, was raised to the rank of bashaw, and nominated to the government of certain districts of the Morea. But longing to revisit his native country, he entered into a secret correspondence with the Venetians, then at war with the Turks, obtained absolution, along with a considerable church living in Franche Comté, delivered the towns and forts under his command into the hands of the enemy; and was actually presented by Lewis XIV. to the vacant see of Besançon. The Pope, however, who had granted absolution, refused the bull,—and Vatteville was obliged to content himself with the first deanery, and two rich abbeys. In the midst of his magnificence he sometimes deigned to call on his old friends, the Carthusians, and, at last, expired quietly in his bed, at the advanced age of ninety!—A roturier, guilty of one half of his enormities, would have been broken upon the wheel.”

The story from Joinville, which follows, is most unmercifully lugged in by the head and shoulders; and it is related as vilely as it is introduced.

In his notes made at Lausanne, Mr. Muirhead remarks a curious passage from the chronicle of Marius, or S. Maire, who died A. D. 601. In recording the effects of a prevailing small-pox (*variola*), he notices that it proved fatal to cows. Eighteen months ago this circumstance had been communicated to Dr. Beddoes, through us, by

Mr. Coleridge. We will copy his letter, as it states the circumstance more fully, and adds to it another fact equally important.

Marius, a Burgundian noble and ecclesiastic, who died in the year 601, possessed a fertile estate about five miles above the old Aventicum; this estate he cultivated with his own hands, and employed himself in winter in making utensils for the church service. On this estate he built a church and a large manor-house, and this was the first beginning of the town of Peterlingen. So Muller, the Swiss Tacitus, informs me, from whom I have extracted this account, for the sake of that which is to follow. This same Marius wrote a chronicle, partly of what had been related to him by old people, and partly of the great events of his own times. This chronicle is to be found in Du Chesne; and under the year 570, is the following curious passage, which I confess gave me no little pleasure, as adding strength to the most rational hypothesis, concerning the nature and origin of the cow-pock. *Hoc anno, morbus validus cum profluvio ventris et variolâ. Italiam Galliamque valde afflixit, et animalia bubula per loca superscripta, maxima interierunt.* (This year a strong disease, with flux and variolous eruption, grievously afflicted Italy and Gaul; and the horned cattle throughout the above-mentioned places, chiefly died of it.)

If then, at the time of the first appearance of the small-pox, the disease affected horned cattle even more than the human species, is it not a fair inference that cows must still be naturally susceptible of the contagion, and consequently does not the fact strengthen the probability that the cow-pox is the small-pox in its mildest state, and received by the cows from inoculated milkers? The account given by Haller of the first appearance of the small-pox, accords in date with this of Marius: he says, it was brought by the Abyssinians into Arabia, at the time of their conquest of the province of Hamyer, carried thence by Greek merchants to Constantinople, and from Constantinople to the north of Italy, by the army of Belisarius.

“I remember another fact in confirmation of the hypothesis, which if I mistake not, for I speak entirely from memory, was in a pamphlet by a Doctor Layard, who, in the great disease among horned cattle in 1756, (I will not an-

swer for my dates, but of the fact I am certain) proposed the burying of the animal with all its litter: his plan was adopted in England, France, and Flanders, and actually stopt the spread of the contagion. But in Denmark the physicians, who were consulted by the government on the occasion, pronounced the disease to be a genuine small-pox, and proposed the inoculation of the calves and cattle hitherto uninfected. The measure was adopted, and attended with compleat success. Whether or no I am deceived in the inference, the facts at all events are curious."

Mr. Muirhead resided for some time at Lausanne, and did not leave it without regret. Lyons was his first station. An academician of this city, had kept a register of the births and deaths for twenty-four years; and we shall extract such of his results, as will interest political and physical speculators.

"2. The males exceed the females by a twenty-third. 3. The months of August and September are most fatal to infants and children, December and January to those of ten years and upwards. 4. More boys than girls die from birth till ten years, and more girls than boys from ten to twenty. 5. Four-ninths die before the twentieth year. 6. Females, who have attained the age of sixty, generally live longer than men who have attained the same age; but more men than women have completed their century. 7. Longevity prevails most in the cloister. 8. The crisis of climacteric years is unsupported by fact. 9. The proportion of births is as one to seventy-two."

A good anecdote is related of the canons of Lyons.

"When the abbé de Villeroi, who had made many unsuccessful attempts to become one of their number, was appointed by the king to the archbishopric, they waited upon him with the usual tribute of respectful compliments. While he received them with courtesy, he could not help remarking, that the stone which the builders refused was become the head of the corner. Their spokesman instantly replied, This is the Lord's doing, it is marvellous in our eyes."

Of the literary natives of Lyons Mr. Muirhead notices the abbé Terrasson, with deserved respect. His *Sethos*, indeed, is an admirable romance. It would be rendering a useful service to the public, to edit a translation of this work, with notes and references to classical authorities. Terrasson speculated in the schemes of Law, "tasted of the

transient benefits, and when the bubble burst, again sunk into retirement without a sigh. *Me voilà, said he, tiré d'affaire. Je revivrai de peu,—cela m'est plus commode.* They who knew him knew he was sincere; for his character was marked by a love of tranquillity, and much apparent stoicism and simplicity." It was from his romance that Warburton borrowed his hypothesis concerning the Eleusinian mysteries.

Avignon was his next resting-place. It was not without pleasure, as well as surprise, that we perused his account of the Jews there.

"Well, said a sensible and affectionate friend, you have to pass some months at Avignon, which shelters the French renegade, and fosters an undue proportion of monks and clergy. I studied there myself, and am no stranger to the character of the inhabitants---Beware of forming intimacies, and recollect that the Catholics are there the Jews. The point of this parting exhortation recurred with singular zest when, upon a Friday evening, a canon of the cathedral politely offered to conduct me to the synagogue. The latter is small, but neat, and mimics the distribution of the temple of Jerusalem. The chanting of the Hebrew service is peculiarly grating, but the composed air of the worshippers betokens the sincerity of devotion. The women occupy an under apartment, and have the service read to them in the Provencal dialect, as few of them understand Hebrew. When I took the liberty of asking one of them why so few of her sex attended the synagogue, she replied that most of them were occupied with family concerns, and could say their prayers at home. Nor would I willingly suppress the following trait. Upon observing an elderly man, to whom those in the porch paid particular attention, I presumed he was a rabbi—but was soon informed that he was a simple honest trader, who had lately paid the amount of a bond of surety, which, owing to some flaw in the deed he might have evaded with impunity. He is nearly reduced to poverty, but has acquired additional respect, and has preserved his peace of mind. His brethren here, to the number of five or six hundred, are allowed to live cooped up in a separate and ill-aired quarter of the town, in consideration of repeated douceurs, and upon condition that the men wear orange or yellow hats, and the women flat caps, stuffed at the sides. Yet it is generally allowed that they live quietly, and that they are more exemplary than their neighbours in the discharge of domestic duties. Their modest inoffensive deportment must sensibly affect every feeling mind, and induce it to sympathize with an unfortunate portion of our species so long branded with epithets of the vilest abuse; so

often doomed to bleed at the shrine of relentless fanaticism, so often goaded by persecution to gratify the avarice or the caprice of princes."

From Avignon the traveller went to Baresges, Toulouse, Nismes, and Marseilles. In this last city, it is remarkable that Newcastle coal should be cheaper than coal carried landways, though only fifteen miles distant. A very honourable character is given of the Marseillois. A merchant will freely entrust his most important keys to the porter attached to his service. The theorist who, like Major Jardine, believes the human race are improved by crossing the breed, would indeed expect the Marseillois to be the best of the Frenchmen.

"Spondanus, Bouche, and Noguier, assert a curious fact, namely, that in 1596, shoals of dolphins infested the port and streets of Marseilles, crowded into the ships and galleys, some of which they sunk, devoured the bodies of mariners who fell into the water, and compelled the tradesmen to shut their shops. Recourse was had, but in vain, to various expedients of destruction. These bouncing guests made good their quarters during a complete month. At length a deputation was sent to cardinal Aquaviva, then legate at Avignon. His eminence dispatched Bordini, bishop of Cavallon, who, in virtue of his exorcising talents, commanded the invaders to retire, and they disappeared in a twinkling. "Manifesto segno," observes the pious Fantoni Castrucci, "della potestà della chiesa Romana, ch'è la vera chiesa di Christo, dato

oportunamente, o per conversione, o per confusione degli eretici di quel tempo." Did Bordini's exorcism consist in a little Italian slyness? or had the dolphins previously indicated a disposition to take leave?"

Or is the whole a lye? if we may be permitted to add our query to the tale. That shoals of dolphins should have infested the port of Marseilles is very possible; but it is rather extraordinary that they should board the ships, and still more extraordinary that they should walk the streets, and go *a-shopping*—they could have no business any where but at the fishmongers.

Mr. Muirhead sailed from hence to Leghorn, and then proceeded to Pisa; circumstances of peculiar urgency then recalled him to his native country, and his narrative abruptly concludes. We notice several Scotticisms in his stile, such as *she caused write, caused bury, abstracted for stole; would for should, on the streets, &c.* There is occasionally an affectation of language as well as of sententiousness, as when he says that Toulouse was *designed* Palladia, from the olive groves which environed it, when he speaks of huts *adjected* to eminences. These are trifling faults. The author is a man of observation and talents; and we wish he may travel again, and travel more leisurely, and publish a fuller journal.

ART. XII. *A Non-Military Journal; or, Observations made in Egypt, by an Officer upon the Staff of the British Army: describing the Country, its Inhabitant's, their Manners, and Customs.* 4to. pp. 165, with Engravings.

THE author of this volume, or rather the writer of these letters, for they were penned with no serious consciousness of authorship, had prepared the materials for a History of the Campaign in Egypt; that design he laid aside upon learning that Colonel Anstruther had undertaken, at the instance of the ministry, to publish the transactions of that campaign, and has accordingly, now that Sir Robert Wilson has supplied the more serious part, given to the public the more amusing.

The letters begin with a description of the voyage up the Nile to Rosetta.

Rosetta is described, as all writers except Savary describe it, beautiful without and wretched in its interior. The population at this time was computed at 16,000, of whom 250 are christians and 60 Jews. These people, and some

few of the European Turks, speak a Lingua Franca, which the author truly observes, is at least a very accommodat-ing language, if not a very pure one. The narrow streets are made to appear still narrower, by a seat or bench built out from the walls, upon which the inhabitants sit, smoke, and sleep. The projecting windows are supported frequently upon granite or marble columns; the remains of a better age, and a better people, which these wretched Mahommedans have placed as often upon the capital as the base. The windows are latticed as in Spain. "The description of one room is of every room, surrounded by cushions raised about 8 inches from the floor upon a frame, and large pillars against which to lean, ranged along the wall. The magnificence of the room consists in the

beauty of the silk with which these pillars are covered, and the fineness of the carpets which are spread over the cushions. They sleep on the ground, and in their clothes.

The picture of this town is lively given.

"Entire long streets, if paltry narrow lanes deserve to be so called, filled with little miserable shops, in which you see a dismal meagre-looking figure, if not blind of at least one eye, certainly with both sore and inflamed; rolled up in a blue shroud, or rather loose shirt, like our carter's frock, stretched at his length, sleeping, or else sitting cross-legged in the middle of his tenement, eating bread and garlic pounded in a mortar, with rancid oil; or garlic and horse-beans fried in this same sort of oil; or cucumbers and sallad, which they stuff in handfuls down their throats; or water-melons, which they ravenously devour as if afraid the passer-by was going to snatch them away; or a dried fish, with mountains of rice, which they cram down with their fingers; and, when one imagines they are so full as to be unable to hold another grain, a gullet of water is applied to the mouth, not taken from it until empty, although at least a quart shall have been its contents. I never saw people swallow so much at a draught: it is true they drink seldom, which is a fortunate thing, or God help the Nile!

"The shopman is at no trouble in handing you the thing you want, for, without moving from his seat, his hand reaches all corners of these shabby little holes, rather than shops, which are square places inclosed, about three feet from the ground, upon a broad wall or bank, which, projecting from the house, makes the passage through the shop-streets, already too narrow, so impracticable, that an European nose can't venture to force its way through the crowd, assailed on one side by strong smelling cheese and rancid oil, on the other by garlic, and the filth of the people themselves."

"Your ears are constantly assailed by the clinking of the bason and jar of the shirbett-seller, who parades the streets to satisfy the drought of the passengers; honey and water, liquorice and water; in short, shirbett of all kinds (water sweetened) is his beverage.

"Your eyes are next caught by the barber's shop, in which you see half-a-dozen bald heads enveloped in suds and lather, which, the barber, (with his customer's head and a lump of soap in hand) spreads over face, head, and neck, and, never minding eyes, nose, or mouth, scrubs away until one would imagine he had stifled the miserable but patient sufferer, whose neck is bent forward to hinder the water, poured from a large urn upon the top of his head, from running down his back; the expert shaver

then, most dexterously certainly, performs his operation in the reverse way to which we do, pushing the razor from, instead of drawing it to him, and concludes the ceremony by opening the spout of the water-urn, washing off all the soap, plucking the hairs from the ears and nose, and finally cutting and pairing the nails; and-all this for three paras!

"Your nose is now attacked by the snuff-maker, who, with a mortar between his legs, and an immense heavy log of wood, sharply pointed, pounds and cuts the tobacco, at the great risk, I always think, of the fingers of his feet, with which he very dexterously holds the mortar."

The water-carriers are completely dressed in leather, and use goat-skins instead of barrels. In the coffee-houses, which are numerous, a story-teller usually amuses the company. The Scribes have their open-shops; they not only copy books, but make out petitions and write letters: a very useful people in a country where not one man in ten thousand can write or read.

"But now for the description of one of the employments of the fair sex. You must know firing (I don't mean shooting) is a very scarce article, there being, in fact, no wood in the country but date-trees, which they convert into so many better uses, as I will hereafter tell you, that they don't cut it for fuel; the imported wood is of course very dear, and only to be gotten by the people in aid about the towns, so that in truth the whole firing of the country, one may almost say, is produced by the happy composition and delicate feminine work of the lower class of women, who dance attendance upon the cattle, and not only carefully, but with avidity and delight, "*rumassent-cc qui tombe*," and with a melange of dust form a hard thick *pancake*, of which they make their fires: never was any thing so shockingly disgusting as this is. From my window, which opened upon several court-yards full of oxen and buffaloes, I could not help seeing it; and curiosity (though not a woman) made me watch them; the creatures almost naked, nothing but a loose shift, and trowsers to the knees, all in rags; wallow in the filth; and, seriously speaking, seem to delight in it."

The okells or caravanseras have each a sort of colonnade, where such travellers as are not able to pay for a room, are suffered to rest: a lesson, says the author, to countries that are reputedly so civilized. The plague of vermin seems still to have remained upon Egypt; the officers complain even more of the flies and mosquitos upon the march, than of the creepers and crawlers in the towns.

"The whole country is one continued flat, intersected with dykes and canals for the admission of water at the overflow of the Nile; the beds of some of these dykes are even higher than the level of the country: at a particular time they are cut, the land is thus covered with water, and manured by the fat and slimy mud it brings with it, that produces the uncommon abundance of grain which Egypt boasts.

"As a great portion of mud remains in the dykes, which would be filled up if they did not clear them, it is thrown out on each side, making immense banks, or laid in heaps, which, in course of time, form the artificial hills upon which all their villages are built, and thus secured from the water, while the surrounding country is inundated.

"By describing one village you describe all; invariably built upon one of these hillocks; an assemblage of flat-roofed square mud-huts; few houses with upper stories or walls of brick; oval kennels of mud, without any window, and only a small hole, through which they creep, and were it not that a hollow is dug about two feet in the sand they would scarcely be able to stand upright in them. The Arab hut, like the "cobler's stall, serves for kitchen, parlour, and hall;" in truth answers every purpose, for they are beastly dirty.

"Almost every house has its pigeon-cote erected upon the roof, in a curious form, and giving a very odd and picturesque appearance to the whole: a mosque or two, according to the size of the village, a number of ragged inhabitants, and a few date-trees, finish my description of the Arab village, which, at some little distance, wears the appearance of a fortification, and does in fact afford excellent cover to the guard which is regularly mounted every night by the inhabitants to protect them from the incursions of the Bedouin Arabs. There are three distinct styles of habitation; the best of brick, with latticed windows and upper rooms; the intermediate ones of mud, four walls forming a square with flat roof, and holes in the wall to serve as windows; the worst sort, oval hovels of the same material, mud. Outside of each village is a burial ground, which at first sight appears to consist of a number of the oval huts I have just described, but, upon a nearer approach, you find are tombs of brick, really well constructed; with infinite labour and pains bestowed upon them; they certainly take better care of their dead, than of their living."

The funerals reminded the author of the same ceremony in Ireland. The interjection of joy, *ululab*, reminded him also of the Irish *philalub*; and though this indicates sorrow, he asks if there be not an affinity between the words: the fact is, that these words, like howl, ululo, and *ολολυζω*, are all imitative and

derived from the same sound, the first which infants articulate.

The strange custom of hatching their eggs in ovens, is said to have dwindled the race, and perverted their instincts: few hens will sit to hatch—a treble price is demanded for one that will. There never was a country, says the author, better calculated to feed an army: buffalo beef, mutton, corn, rice, pulse, vegetables of various kind, all good and cheap; yet the bread with which the poor Arabs must content themselves is little more than the husk of the corn and water. It is remarkable that the English seldom felt any want of water; they usually found it near the palms, at a depth of from four to seven feet. The French were ignorant of this, and were convinced that no water was to be procured between Alexandria and Aboukir.

A curious anecdote is related to exemplify the abject contempt in which Christians were held in Egypt before the French invasion.

"Mrs. Varsy, my hostess, told me a ridiculous circumstance, which you shall have in her words: "When my son was at my breast, I used now and then to give him to an old Arab servant-maid to hold; the woman always seemed in agony whilst she had him in her arms. At last, upon asking her why she appeared to be in such distress, she told me, "that to say true, she had been to consult with one of the Imams whether the water of a young christian child, at breast, was impure; and that his answer was—If the mother drinks wine it is decidedly impure, otherwise it is not so—Now, Ma'am, you know you do drink wine, and I am therefore kept in constant alarm lest the infant should misbehave, which always obliges me to change my cloaths, or to wash the part of them defiled."

"I confess," says the writer, "that were it not for political reasons, and lest their wandering spirits might have crept into the East, I could almost lament that the French, for the benefit of mankind, have not remained here; with the sea open to them, they might have brought about, after some time, such a change, that the country would have put on a new appearance, or more properly I should say, its old appearance; it is certainly to be made one of the finest countries in the world. I had rather the French should have the pleasure of making it so, than it should be our lot, thousands would fall in the attempt, and I doubt if success would be quite ensured."

We too regret that any interests, real or imaginary, of Great Britain should oppose the progress of civilization.—

But armies, such as armies are now, are wretched civilizers. They would, indeed, be needful in such a country as Egypt, to enforce the law; but woe to the country where they give the law! The French in Egypt were under no restraint of religion, for they were instructed, by the example of their leaders, to profess any religion as it suited them. They were equally destitute of all morals, and instead of introducing European decency among the conquered people, they themselves fell into the practice of vices most infamous in Europe. The miseries and crimes occasioned by the unhappy expedition of Bonaparte, are beyond calculation. We are told, by this officer, that the women who cohabited with the French soldiers, almost invariably destroyed, before birth, the creatures who would else have been the children of christians! A massacre of these unhappy women was expected to take place whenever the Europeans should quit the country. When the English took possession of Rosetta, the wives of four French officers, all of whom had children, were forsaken by their husbands, and turned into the streets, for the inhabitants feared the Turks would murder them if they suffered the wife of a Frenchman under their roofs!

When these letters were written *Bon John* was very naturally the favourite in Egypt. Some remarkable instances are quoted.

"Near Foua, a captain of the navy had straggled from his boat, was seized by some Arabs, who, from the similarity in his uniform, mistook him for a Frenchman, had plundered and stripped, and were actually about to murder him, when one of them, more sagacious and humane than the rest, tore a button from his coat, suspended his

execution, ran to the bank of the Nile, and, seeing an English boat, produced the button to the sailors, who acknowledged it by calling out *Ingles*; he instantly returned to his party with the information, who as quickly released their captive, restored to him his effects, and escorted him in safety to the boat.

"An Arab, who had lived at Aboukir before the arrival of the French, upon their taking possession of that place, quitted it, having first covered up most secretly a remarkably good well close to that village. He had constant intercourse with the French during the whole of their stay; but such was his inveteracy towards them that he never divulged the secret. The moment we reached Aboukir, he took Sir Sidney Smith to the spot, a few men soon opened it, and found a large well of the very best water."

Yet this officer believed, that as soon as the French were out of the country, the inhabitants would rejoice to see the English follow them, because they are Christians.

This volume has been ascribed to Major Doyle: we have reason to believe that it is the work of an older officer, but as he has not thought proper to set his name to the title, it would be impertinent in us to announce it in a review. Some inaccuracies of language the reader will have observed in our extracts—we were more displeased with the recurrence of certain slang phrases, common among young men of fashion, who would do well to spare our language, and confine themselves to inventing alterations in our coats, waistcoats, pantaloons, and boots. These, however, are trifling faults. More living authors than one have acquired reputation by books of less observation, only because they were more serious, being dull.

ART. XIII. *Travels in Turkey, Asia-Minor, Syria, and across the Desert into Egypt, during the Years 1799, 1800, and 1801.* By WILLIAM WITTMAN, M. D. of the Royal Artillery, &c. pp. 612.

"IN the present multiplicity of books, to obtrude a new work upon the public argues an opinion in the author, that it either contains some new information, or if the matter is old, that it is in a dress which is both original and advantageous. To the latter the writer of these pages makes no pretensions; with respect to the former, the fault is his own if the work should be found to contain no information but what is already familiar to his countrymen.

"Attached in a professional capacity to the British military mission which accom-

panied the army of the grand vizier in its route through Turkey, Syria, and Egypt, during the late memorable campaign, he was certainly in a situation peculiarly advantageous for observing the manners, customs, and habits of the Turkish nation, not only with the Grand Vizier himself, but with the principal personages of the Ottoman empire.

"In the course of his travels, he saw many things which, to him at least, were uncommon; and he was in the habit (partly to relieve his mind from the irksomeness of

his situation, and partly in the hope of gratifying his particular friends) to note down whatever appeared worthy of remark. On communicating these notes to those for whom they were originally intended, it was their wish to see them in print, as containing matter which, according to their partial opinion, was calculated to interest a still wider circle. Such a task, when he commenced his journal, he did not expect he should have to encounter; and this statement, in every respect consonant to truth, he trusts will shield him from the severity of criticism, which is most properly directed against such publications as are, from the first, intended to challenge the approbation of the public."

Dr. Wittman's situation was indeed, as he boasts, peculiarly advantageous; and if it shall appear, that in his new matter there is little information, and in his old matter no improvement, the fault is his own; and a fault it is deserving the utmost severity of criticism, which, begging leave to correct the author, we must affirm, is *most properly directed against such publications as are, from the first, intended to pick the pockets of the public.*

That such was the intention with which this quarto volume was published, we suspected, upon seeing that many of the prints are copied, from what originals it would be difficult to say, as they have been copied so often, but probably from Sir Paul Rycant. The hand of a modern artist is easily discoverable in the few figures which are actually from modern drawings, such as the two Arnaut soldiers, and the Arab groom. There is internal evidence of this fraud, sufficient to satisfy those who may not have the means of comparison to detect it. The figure of the Capitan Pacha would be familiar to many of those officers who would probably be the first perusers of Dr. Wittman's travels: a portrait of *one of his predecessors* therefore is given. "The costume worn by the Dervises is of a *light quaker colour*, says the author, and a competent idea of it will be formed from plate IV, in which one of their superiors is faithfully represented." In the print this quaker-coloured dress is green.

Nor is it merely in publishing old prints as originals, that Dr. Wittman and his bookseller have displayed their *vamping* abilities: matter a century old is to be palmed upon the public in the same manner, and honest old half-a-crown octavos pilfered to eke out the

pages of a modern two guinea and a half quarto. We shall proceed regularly through the travels of this gentleman; we shall expose his ignorance, his want of observation and of information; we shall detect his plagiarisms, and endeavour to glean some information from his five hundred pages.

Dr. Wittman went by sea to Constantinople: never did man display more poverty of imagination, more beggarliness of language, more meagreness of mind, than this writer has manifested in his descriptions of the finest scenery in the world. "We had a distant view of Mount Etna and Strombolo, than which nothing could be more awful and grand. The Lipari islands added to the effect of this fine scene," p. 3.—"The city, harbour, and environs of Constantinople, presented a magnificent spectacle, new in every respect to our eyes, both as to the architecture of the principal edifices, and the construction of the city itself; but which was on the whole extremely fine and picturesque," p. 5.—"I walked to the vicinity of the mosque of Santa Sophia, which is certainly a very massive building, but which, considered in an architectural point of view, is, in my opinion, very inferior to our St. Paul's. With the exception of the dome, and of the four minarets which are detached, there is nothing very singular or striking in the pile," p. 34. So much for Dr. Wittman's descriptive powers, and his feeling of what is awful in nature, or majestic in art. The only visual object which he has had fancy enough to represent is, that, "the minarets bear a strong resemblance in their form to a tall candle, having an extinguisher at its top."

The barracks of the English detachment were at Levant Chiflick, about seven miles from Buyukdere, where the officers resided; "a very agreeable dish called *yourt*, of which the natives are very fond, is made here and brought in with the dessert. It is prepared by allowing a certain portion of milk to become sour, and throwing into new milk as much of this acidulated fluid as will curdle it in a slight degree. It is then eaten with sugar; is very palatable, and mixed with strawberries, becomes a good substitute for cream." Dr. Wittman has noticed another dainty of the Turkish dairy, which we hope will find its way into many a family cookery book. Large shallow vessels having been filled

with new milk, are placed over a gentle wood fire, and the milk kept simmering for the space of twenty four hours, when it is left to cool. On the following day the surface, which has assumed a consistent form, is taken off, cut into small portions, and rolled up for use. This is the *kymack* which is so generally used, and so highly esteemed in Turkey. It is an excellent substitute for butter, and is also eaten with honey, or sugar, or salt.

During his residence at Buyukdere, the doctor relates such daily occurrences, as would be esteemed too dull and unimportant for what is technically called, *stuffing*, in a garrison gazette. "In company with General Kochler, and the other officers, on the 19th, I dined with the Russian ambassador at his palace, at Luyukdere, where we were sumptuously entertained," p. 19.—"On the 20th, twenty men belonging to the mission, and several women were sent to the above barracks. On the 21st, I went on board the *New Adventure* transport, lying in the harbour of Constantinople: in the afternoon I returned to Buyukdere by water," p. 20.—"On the 24th and 25th, I paid my customary visits to the barracks, at Levant Chifflick. During the night of the 24th, Mrs. Wilkinson, wife to a corporal of the royal artillery, fell a victim to a dysenteric complaint," p. 21.—"On the 26th, on my return from the barracks I dined with the general," p. 22. Admirable accuracy! gentle reader, it was Dr. Wittman's habit to "note down whatever appeared *worthy of remark*; and on communicating these notes to those for whom they were originally intended, it was their wish to see them in print, *as containing matter real*, according to their partial opinion, *was calculated to interest a still wider circle*."

Dr. Wittman is little more amusing or instructive when he digresses from this precious journal of his rides and his dinners: the only things indeed which he seems to have noted upon the spot, except the cases of his patients. The uninquiring and contented ignorance with which he has beheld every

thing, is truly marvellous; he tells us of the brazen pillar in the old hippodrome, formed by the twisting of three serpents, and that Mahomet the second, when he took Constantinople, beat off the jaw of one of their heads: but he has not added the circumstances which render this the most venerable relic in existence, that it originally supported the golden tripod, which the Greeks presented to the temple of Delphi, after the defeat of Xerxes. He says, that the house of Osman (Ottoman) established the fifth dynasty of the caliphs, as if the caliphate still subsisted! and he speaks of the mufti of a mosque in Jerusalem, which is like calling an English vicar archbishop, or a French curé, pope.

The famous cannon at the Dardanelles are said to have a diameter of thirty inches; the author saw a Turk seated in one of them, eating his meal. Baron Tott's tale has been ridiculed, but the following anecdote will establish his veracity, if farther proof were now needful.

"At the time when Lieutenant-colonel Holloway and Major Hope were engaged in the survey of the castles and coast, a practice was made by the Turks from the great guns at Chennecally for the purpose of convincing the English officers that their large marble and granite balls, discharged *à ricochet*,\* would reach quite across the Dardanelles. They indeed furnished a melancholy proof of this; a family of three individuals, sitting in a field on the opposite side, having been killed by one of the shots."

Dr. Wittman witnessed some singular ceremonies of a public breakfast given by a Russian Captain, on board his ship.

"Previously to the breakfast, tongues and liqueurs were presented to us—a custom which we were given to understand is constantly observed by the Russians. During the breakfast, which was of the most sumptuous kind, several toasts, given by the captain, were drank, and cheered three times. The captain now entertained us with a Russian dance, while a part of the crew, cleanly dressed for the occasion, sung to an accompaniment of Russian music. After a short interval, the captain fell on the deck, apparently from accident, when the singers took him

\* "In firing *à ricochet*, the piece is no more than half charged, inasmuch that it carries the ball to a certain distance only. In its fall, the latter skips, rolls, and makes rebounds (*ricochets*), as is the case with pebbles thrown in a horizontal direction on the surface of the water, in skimming, which they produce what by boys are called *ducks and drakes*. This practice is employed to sweep and clear a covered way, a rampart, &c. and its invention is ascribed to the celebrated Vauban."

in their arms, and tossed him in the air, repeating certain phrases. Each of the guests afterwards underwent the same ceremony. The next singular occurrence was, that on the health of the Russian minister at Constantinople being given by the captain, he demanded aloud what others would do for him. Instantly a Russian officer, and nearly twenty of the crew, jumped from the cabin window into the sea, with their clothes on. The stern ladders were the only resource they had to get on board again; and on their entering the cabin with their wet clothes, they danced round the captain, occasionally prostrating themselves at his feet. On our going on shore, the greater part of the barge's crew threw themselves into the water, and swam by her side until we reached the beach. A few piastres distributed among them were, as I apprehend, considered by them a sufficient recompense for the ducking to which they had subjected themselves."

A Turk who had assaulted one of the English mission, and attempted to murder him, was condemned to be beheaded; the sentence being mitigated at Lord Elgin's intercession, he received fifty strokes of the bastinado on the soles of his feet, and was sentenced to twenty years imprisonment in the college of Pera, to learn the Arabic language.

After a long residence in the vicinity of Constantinople, the English were sent to join the Turkish army at Jaffa.

"We found the Turkish troops encamped in the most confused and irregular manner, without any order in the positions they occupied, each individual having pitched his tent on the spot which was most agreeable to his inclination. The only regulation that seemed to border somewhat on system was, that each Pacha, or military governor, was surrounded by his own men. The encampment was on a white sandy soil; and I observed a considerable number of tents converted into cook's shops, while others were set aside for the sale of various commodities, particularly coffee and tobacco, of which, among the Turks, there is a great and constant consumption.

"The situation which had been chosen for the camp manifested an incredible degree of ignorance and imprudence on the part of those who had been entrusted with the marking out of the ground: being placed to leeward of the town, the sea breeze, which constantly prevailed during the day time, distributed to every part of it the putrid noxious effluvia which the streets of Jaffa produced. The tents were absolutely pitched among the abodes of the dead; and the bodies of those who had been interred were in general so superficially covered over by the earth, that the putrid exhalations

which were thus generated were intolerable to the passenger, and must have been as baneful as disgusting to those who were constantly exposed to them. To complete the horrors of this scene of filth and depravity, the carcasses of dead animals, such as camels, horses, and asses, were scattered in great abundance among the tents, to corrupt and moulder away, without giving the smallest concern, or apparently offering any kind of molestation to the Turkish soldiery.

"The departure of troops from the Turkish encampment was, as well as their arrival, customarily announced by the discharge of muskets loaded with balls, which, flying at random in every direction, endangered the lives of all those who were within their reach. This practice of firing with bullets, which is followed in every Turkish camp, was indeed become so frequent, that we were under constant apprehensions of being shot. Our tents were repeatedly pierced by the balls; and one of our men, an armourer, was, while at work in our camp, wounded in the shoulder by a musquet-ball. The Turkish soldiers, who furnish their own ammunition at all times, except on the day of battle, when it is provided for them, conceive they have a right to amuse themselves in this manner at their private expense."

Here Dr. Wittman relates the tale of the massacre at Jaffa; a fact which we would willingly disbelieve, if the evidence did not appear irrefragable. We need not transcribe what has already been placarded upon the walls of every city in England. Yet it appears to us that Dr. Wittman's testimony is of little weight: I have seen the skeletons, he says: but how are they distinguished from the skeletons of men slain in battle? Still less conclusive are the circumstances which he adduces, to prove that Bonaparte ordered his own sick soldiers to be poisoned. An individual was pointed out to him as having been the executioner of these diabolical commands. Is it to be believed that the French army, or that any army, would suffer a man to exist in the same country with themselves, who was known to have been the poisoner of their comrades? Or is Dr. Wittman so ignorant of the nature of evidence and of justice, as to admit rumour for proof, and condemn a man merely because he has been accused?

"I introduce the following anecdote to evince, among other facts, the very unenlightened condition of the Turks, without excepting even their principal men, in whatever regards the sciences. General Koehler was requested by the Grand Vizier to have a map of the world sketched out for him. This request having been complied with, a

conversation ensued, in which the general, having the plan before him, told his highness, among other particulars, that the earth was round. This information caused no small degree of surprise to the Turkish minister; and, it appeared, by his reply, that he was disposed to doubt the truth of the assertion. "If," he observed, "the earth is round, how can the people, and other detached objects on the half beneath, be prevented from falling off?" When he was told that the earth revolved round the sun, he displayed an equal degree of scepticism, observing, that if that was the case, the ships bound from Jaffa to Constantinople, instead of proceeding to that capital, would be carried to London, or elsewhere. So much for the astronomical and geographical knowledge of a Turkish statesman!"

But however the Grand Vizier may be deficient in the sciences, there have been worse statesmen than he in England. In speaking of the convention of El Arish, he compared the English ministry to a physician, who, having given to his patient a dose of medicine by which he was relieved, administered to him an after dose, which rendered him worse than he was at first. Among the many errors of that miserable ministry, this indeed stands conspicuous.—Had General Kleber appeared in France, Bonaparte would probably have sunk into ignominy and contempt, under the accusation of a brave, and honest, and able man.

Here, says the author, my narrative is about to take a new turn. A visit to Jerusalem, and other parts of the holy land, had been for some time projected, and the state of inaction in which we found ourselves at this juncture, prompted us to gratify our ardent curiosity by the accomplishment of such a journey. That Dr. Wittman did visit Jerusalem, there is no reason to doubt; but his descriptions are taken, and his measurements copied, from Maundrel, without acknowledgement or reference to that author.

A Scotch renegade, by name Mustapha alias Campbell, was in the Turkish army, as Cumberagi Bashi or general of bombardiers.

"An implicit confidence having been reposed in his talents and fidelity, he was, in his early career, entrusted with the superintendence and construction of the military works in the Turkish empire, several of which, executed under his direction, are still in existence. At the time of this visit to the Turkish camp, he was between seventy and eighty years of age, and appeared to be well informed, and to have received

a polished education. He had been repeatedly attacked by the plague, relative to which disease he communicated to me a singular fact that had come within his knowledge. A female Circassian slave of great beauty was attacked by the plague, and sunk under the complaint; while her master, who had still continued an intercourse with her during her illness, escaped the infection. From this and other similar cases which have been recited to me, it would appear, that a certain susceptibility is necessary to the reception of the disease, or, in other words, that its contagious action is resisted by a certain state and condition of the body. Could this particular state of the temperament be so well ascertained as to be produced by the means of art, the contagion might be effectually resisted, and its deleterious effects completely prevented. I may perhaps be thought too sanguine when I indulge in a hope, that this discovery, so essential to the happiness of mankind, or some other of paramount efficacy, will one day be brought to light."

The gravity with which Dr. Wittman infers, from this horrid and disgraceful fact, a conclusion which every country apothecary knows will apply to every infectious disease, is truly wonderful. This circumcised Scotchman reminds us of a singular circumstance, which we know to be true. A tradesman in a town of Berkshire, finding that his affairs declined from bad to worse, determined to forsake his country, and turn Turk upon speculation. He communicated his intention to his wife, took leave of her and sent her home to her friends, and sailed for Constantinople and put his design in execution. His wife, or rather widow, received one letter from him after some few years, to say that he was doing well in the world, and had got three wives besides slaves in his harem.

From Jaffa Dr. Wittman proceeded, with the Turkish army, to El Arish, crossing the desert; and thence, on the success of the English, advanced into Egypt. The account of the places which they passed on the march, has been helped out from Sandys. In his description of the *mirage*, some circumstances are mentioned which were new to us.

"It presents the distant appearance of water with such an air of truth and reality, that the shadows of the camels who were in advance, seemed to be reflected on the apparent watery surface. To give a more extraordinary effect to the illusion, the bodies of these animals appeared to be narrowed and elongated upwards, so as to give them the appearance of trunks of trees, the

branches of which had been lopped off. The most elevated of the distant sand hills represented light clouds; while the smaller ones appeared like ships under a press of sail in the midst of beautiful lakes. This phenomenon was more particularly apparent on the levels, which were in some parts covered with a saline substance, finely crystallized, and very shining and brilliant."

The doctor's journal in Egypt is filled with the same impertinences as he thought worthy of remark at Constantinople. "Major Wilson, of Hompesch's regiment, arrived in the camp on the 15th, with dispatches from the British army. He set off in the evening, mounted on a hedgin, with dispatches from the Grand Vizier," p. 304. "The Vizier was at this time indisposed with fever, and required my constant attendance; as did also Mahomed Pacha. Lieutenant Janverin of the royal navy, was at this time sent off with dispatches for Suez. On the morning of the 23d, an officer belonging to the British cavalry stationed in the Delta, came into the camp with letters: his arrival was followed by that of Major Wilson." "I rode in the morning along the banks of the river, to the vicinity of Shellacan, or Charlacan, at the junction of the two branches of the Nile, and had thence a view of Cairo, as well as of the pyramids of Giza. I rode in the afternoon to Harrachneah, a village distant three miles from Shellacan, and eight from Cairo, &c." ; and so on, with a diary of rides, and deaths, and dinners, under the title of Travels in Asiatic Turkey, Syria, and Egypt.

Sometimes these valuable paragraphs are varied by others equally important, of a scientific nature. "On the 16th, I rode to Belgrade, and returned to Buyukdere. I brought home with me some of the air of Belgrade to examine." He brought from Jerusalem two bottles of the water of the Dead Sea, which, upon their arrival in England, he means to endeavour to analyze. A portion of the saline matter in the deserts, he collected for future experiments. "I employed myself, on the 24th, in examining the waters I had collected at the different places at which we had stop-

ped in our passage through the desert, and collected the residuous matter for future experiments. I collected some of the mud of the Nile, for the purpose of future examination, and shall on its arrival submit it to a careful analysis." But none of these future experiments appear in this volume. In one instance, the doctor has omitted a scientific description where it would have been useful.

"I procured, at one of the bazars of Cairo, a sample of the stone which is employed by the Arabs to cure the mange in horses. To effect this, they pound the stone, and convert it into a paste, which they spread over every part of the animal, suffering it to remain on for the space of three days, when it is washed off. This stone is collected on Mount Mokatain, is of a yellow colour, of a texture somewhat soft, and is named in Arabic tuff."

Dr. Wittman can occasionally be accurate—as when he tells us that the Reis Effendi shewed him a pair of pistols which he had purchased in London, and which were made by Bennet near the Royal Exchange.

Peace being concluded, the business of the military was at an end. Dr. Wittman returned to Constantinople, touching at several of the Greek Islands on his way, and from thence travelled by way of Vienna to Helvoetsluys. The appendix contains his medical journals, some remarks on plague and ophthalmia, and a meteorological journal.

No person who peruses this volume can possibly believe that Dr. Wittman collected any part of his original materials with a view to publication, except the medical journals. He seems to have raked up all the rubbish in his memory, after his return, with the wilful design of making a quarto book; and to have poached in old travellers, for descriptions, measurements, and anecdotes of historical topography. The trick has perhaps succeeded—and we have only to express our wonder and indignation that any bookseller or any author should be concerned in so disgraceful a transaction,

ART. XIV. *Travels through France, Turkey, and Hungary to Vienna, in 1792. To which are added several Tours in Hungary, in 1799 and 1800; in a Series of Letters to his Sister in England. By WILLIAM HUNTER, of the Inner Temple, Esq. Third Edition. 2 Vols. 8vo. pp. 900.*

WE notice the third edition of Mr. Hunter's Travels, because it embraces an account, which is now for the first time presented to the public, of "several tours in Hungary." The cursory glance which we have now taken of those letters, which we read when they were published some six or seven years since, has confirmed the opinion which we recollect having entertained of them at that time: they are amusing, but not very pregnant of valuable or interesting information. What Mr. Hunter saw he describes agreeably, and, we doubt not, faithfully; but he did not see much. He trots through France as if he were in a hurry to get out of it, and when detained any where a day longer than he calculated upon, seems to grudge the time. A very faithful diary is kept of the state of the roads, carriages, horses, inns, &c.; but Mr. Hunter forgets that his list of petty grievances, surly postillions, slow-footed horses, bad dinners, and filthy beds, however interesting it might be in a private journal for the perusal of a beloved sister, is excessively tiresome to us, who cannot reasonably be supposed to feel so acutely all that concerned his personal accommodation.

As these letters appeared first in order of time, it is hardly fair, perhaps, to say that the accounts which we have recently received from Sonnini, Olivier, Eton, and Dallaway, concerning the state of the Turkish empire, its inhabitants, its products, policy, commerce, &c. &c. very much depreciate the value of what we find here; but Lady Mary Wortley Montague's letters were published before these; and a great part of the information given here, particularly as to the manners of the Turks, is communicated in a much more minute, as well as more interesting manner, by that fascinating writer.

Mr. Hunter does not appear to be a man of science; we have not a tittle concerning the natural history of any country he visits, nor are his reflections upon any subject usually very philosophic or profound. At Galatz Mr. Hunter dined with the governor, a good-natured but a dull man; this gives our traveller an opportunity of remarking, that good-nature without good-sense "has but few

attractions!" the reasons why are not forgotten to be added. The Greeks at Galatz are fond of dancing, and we are gravely told that "gaiety is an enviable possession;" that "the song and the dance can, whilst they last, erase from the tablet of recollection the galling chains of power, or the vexatious tyranny of avarice." Mr. Hunter plays at cards somewhere with a man who cheats him—we have a long dull lecture upon honesty! He is compelled to pass the night in a field near a village called Palamont, the inhabitants of which refused him accommodation; in parts it was an absolute marsh, and the croaking of the frogs disturbed the repose of our traveller, who tells us, that he "was wishing for an army of Frenchmen to demolish these execrable musicians!" Such silly frivolous remarks as these meet the eye but too often. The filth and stench of the Turkish villages and huts, prove to Mr. Hunter "how entirely man is the creature of habit;" and he might surely have added "of necessity."

Mr. Hunter proceeds to observe, that "the elegancies of life do not make us happier! many of its conveniences may be cheerfully dispensed with; but there are comforts which we absolutely require, and which seem to be interwoven with the very existence of rational enjoyment." The first remark, that the elegancies of life do not make us happier, is not true, and at any rate does no great credit to the delicacy and refinement of Mr. Hunter's taste: the latter is one of those vulgar common-place truisms which so frequently offend us in the perusal of these pages.

But it is time that we should proceed to the "tours in Hungary," and collect the scanty information concerning that country which Mr. Hunter has afforded. Hungary, we had already been told in the former part, is, on the whole, a fine country; the climate being good, and the soil fertile. It produces wine, corn, and all kinds of vegetables in abundance, and in great perfection. Game and wild fowl are plentiful, and the breed of oxen, horses, and sheep is much esteemed: in the mountains there are rich and extensive mines of gold, silver, lead, and other metals; and the salt mines are highly productive and valuable. The Hun-

garians are stated to be a handsome, well-formed, hardy race of men; they are indolent, proud, and revengeful; but generous, hospitable, and brave. Their dress consists of a fur cap with a high plume of feathers, a close vest, and a loose jacket trimmed with fur richly embroidered, with pantaloons and half-boots, which are so common, "that many a gentleman has passed his life without ever having had a pair of shoes on his feet."

"The ordinary dress of the burghers and the higher class of peasantry, in this part of the country, consists of a light blue jacket and pantaloons, and huzzar boots with tassels and spurs. The jacket is edged with fur, and both jacket and pantaloons are embroidered down the seams. The poorer class is obliged to be satisfied with a short shirt and trowsers of coarse linen, the fabric of the country. As the weather grows cooler, they throw a rough blanket across their shoulders, and in winter, clothe themselves with a sheep-skin garment, which reaches down to their heels, and which, according to the temperature of the atmosphere, they wear with the wool or skin next them. At night they convert it into a bed. They are tall, stout, and straight grown, but have heavy countenances, and their long black greasy hair and huge whiskers give them the appearance of savages. The men wear round felt hats with rims and broad shallow crowns, and both men and women go without shoes and stockings. The women who are not by any means so well-looking as the men, are kept in a state of slavish subordination, and are not only employed in domestic drudgery but in the laborious parts of agriculture, such as digging, planting, and following the plough."

Buda is the capital of lower Hungary, and served as a centre for our traveller to make his excursions from. We must decline entering upon the description of this city, as it was given in the first edition of these letters. A traveller in Hungary must visit its mines and the famed Carpathian mountains; Mr. Hunter enjoyed every facility which letters of recommendation could afford him; but the badness of the roads, and the obstinacy of his guides, damped a great deal of his ardour; and yet he was so eager for the excursion, that when, at Cashau, although the opal mines of Czerwenitz are only a short day's journey from that place, he was so fearful of "being too late for the mountains," that he could not prevail on himself to spare time to visit them! Mr. Hunter visited one of the copper mines at Schmölnitz: there are several of them, some worked

by the king, and others by private persons. Some of the caverns are one hundred and eighty fathoms in depth, and branch out at different stages in various directions, to a considerable extent. The works under ground are immense; the pumps for raising water from the mines are similar in principle, but the machinery of them is much inferior to those in Cornwall.

"These mines, although some of them have been worked for centuries past, are far from being exhausted, every hundred weight of ore yielding from two to twelve and even fifteen pounds of pure copper. The private mines are richer than those belonging to the king; but the proprietors are obliged to pay a duty of seventeen per cent. on their produce, for the privilege of working them. All the ore, both from the royal and private mines, as soon as it is brought up, is carried to the public smelting houses, where it is melted and proved. The number of workmen employed in the different mining departments surpasses two thousand, who are not paid by the day, but according to the weight and relative value of the ore; and the quantity of pure copper annually produced is about 15000 cwt.

"These mines bring in a considerable revenue to the crown, by which the chief part of their produce is purchased. Copper, simply refined, fetches thirty-six florins a cwt. and, when manufactured into bars or plates, about forty-eight. But the most lucrative use to which it is applied by the government, is converting it into coin; as, by this operation, one cwt. which costs originally thirty-six florins, yields about eighty in money, leaving a profit of forty-four per cent."

Besides copper, these mines produce antimony and sulphur to a considerable amount, and about twelve cwt. of copper is gained annually by cementation.

At Gros Linnitz Mr. Hunter, having a letter to M. Berzevitzi, expressed to that gentleman his intention of scaling the *peak*, but is recommended to proceed to Hradec, with the view of ascending the Krivan, which was supposed to be of easier access. When arrived at Hradec, however, he was "rather mortified" to learn, that he could not accomplish his project, in consequence of a heavy fall of snow. "There is another natural curiosity about five miles from Hradec," says Mr. Hunter, "which is a subterraneous cavern called Demanovo, but the description of the road deterred me from going to see it." So Mr. Hunter returned to his friend Berzevitzi at Gros Linnitz, where he seemed to enjoy his good quarters. Another valiant attack upon Linnitz, however, was determined

upon: after *an hour's march*, finding a snug sheltered spot, our mountaineer and his companion halted, and kindled a good fire! when sufficiently rested, they proceeded till "an insurmountable barrier of snow" put a stop to their intrepid career. Mr. Hunter, unfortunately, is ignorant of mineralogy and botany; he took this excursion simply for the purpose of admiring the grand and awful scale on which nature presents herself among lofty mountains, and merely tells us, that many beautiful and rare alpine plants are to be met with, "the collecting of which, to those who are fond of botanizing," says he very gravely, "must be an interesting amusement!" Such of our readers as are desirous of being acquainted with the natural productions of the Carpathian Alps, we recommend to turn from these unprofitable rambles to Dr. Townson's mineralogical and botanical excursions among them: his travels through Hungary, published in 1797, contain a great variety of curious and interesting information.

At Soovar Mr. Hunter saw the salt-works:

"The mines belong to the emperor. Formerly the salt was made from the rock, which is in great abundance. But, for many years past, it has been collected from the water which flows through the mines, and which is so strongly impregnated with saline particles, that one hundred weight of water yields twenty-five pounds of salt. It is drawn up in large leathern buckets from a well eighty-one fathoms deep, and fifty-five to the surface of the water. The great pan, in which the water is boiled, is emptied every two hours, when the salt is put into casks, which remain four and twenty hours in the drying houses. They manufacture, at present, about two hundred weight daily; but, by the new works which are erecting on an improved and much larger scale, they are in hopes that the quantity produced will not be less than five-hundred weight. This is a profitable concern for the emperor, as the salt costs him only about twenty creutzers the hundred weight, and is sold at three florins eight creutzers. The magazines of wood are also very considerable."

Mr. Hunter visited the copper works at Neusohl, and the amalgamating apparatus, erected by Baron Born, "for the purpose of extracting by a process of quicksilver, gold and silver from their ores;" the invention did not answer; but in one of the rooms Mr. Hunter saw an useful machine for heating water. It was a large wooden vessel in the form

of a deep tub, with an iron stove within it, standing on three legs; there was a funnel for conveying the smoke, and a tube passing from the stove to the side of the vessel, for the introduction of fuel: so that the stove, which may be heated to any degree, when the vessel is full, stands in the middle of the water. By this method of boiling there is said to be a saving of six parts of fuel out of seven. This hint is worthy of attention.

Upwards of five thousand men are employed in the works at and near Neusohl, and two thousand toises of wood are annually consumed at the different forges. The fuel is brought from those immense forests which extend thirty or forty miles along the banks of the Grau, where four hundred people are employed a great part of the year in hewing it. The copper, which is sold in plates here for fifty-five florins the quintal, produces, when coined, one hundred and sixty-four.

Having traversed Hungary from east to west, Mr. Hunter profited by an opportunity afforded him in the early part of the year 1800, and made an excursion to the south. The indolence of the peasantry here is remarkable; Mr. Hunter attributes it, very plausibly, to the natural fertility of the soil. The farmer never manures his land, and only ploughs three or four inches deep: it yields, nevertheless, abundant crops of excellent wheat and other grain, tobacco, and a variety of delicious fruits. "Such is the abundance of wood (in the neighbourhood of Essek, the capital of Slavonia) and the laziness of the people, that when they are in want of fuel or timber, to save themselves the trouble of using the axe, they kindle a large fire round the trunk, which is kept burning till the tree falls. They then carry off the large branches and leave the stumps, which I have frequently seen remaining," says Mr. Hunter, "after the ground has been converted into arable land." It is the general remark of strangers, that in many parts of Hungary the houses are disproportioned and inadequate to the population: the manner in which Mr. Hunter accounts for this gives one a striking idea of the semi-barbarized state of the peasantry. Ten or twelve families are joint possessors of the same tenement; the various members of this community are, however, widely dispersed. None but infant children, the superannuated, and the sick, are admitted as constant occu-

pants; "the remainder\* is scattered over the country, and is satisfied with an abode in the open air, near the spots where they work in the day time." At Ui Palanka our traveller left his carriage, while he took an excursion on the Danube, the particulars of which he has very agreeably related. The degree of curiosity which this carriage produced here and in some other of the villages, is astonishing: the people had never heard of such a vehicle, and when it remained at any place a day, they flocked from different parts, two or three miles round, to see it! At Temeswar Mr. Hunter wished to purchase a book relating to Hungary, which had been strongly recommended to him. This city, which contains many thousand inhabitants, does not afford a single bookseller's shop!

At Mezzo-Hegyes Mr. Hunter saw the imperial stud, which was founded by Joseph II. for the improvement of the Hungarian horse, by introducing breeds from other parts of Europe, and crossing them with the native stock.

"The number of horses amounted altogether to one thousand and twenty, of which nine hundred were brood mares; and the ground allotted to their nourishment is twenty English square miles. Part of this land is employed in the growth of oats, hay, and a few other general foods. The rest is laid out in pasturages. The houses, stables, barns, and offices, are erected on the most convenient spots, and are constructed both with judgment and taste. There is one long stable, consisting of seventy wide stalls which, at this season of the year, is allotted to the most valuable stallions; and the mares which are reserved for them, to the number of four hundred, graze in enclosures, and in winter are taken up. The remaining five hundred horses are perfectly wild, and range at large. The stallions belonging to these, are in the proportion of one to nine or ten mares, and they have dreadful contentions with each other for favour and superiority. We had an opportunity of witnessing one of their battles. A herd of about one hundred mares was collected together, among which were only three stallions. They were already covered with wounds received in former combats, which however, did not prevent them from immediately commencing

an engagement. One of them was soon completely beaten off the course, and, quite conscious of his insufficiency, slunk away unattended by a single companion. The remaining two then began an attack, and never I suppose, in times of chivalry, was a fiercer contest carried on, in the presence of the fair, by two enraged knights. The mares, however, had more compassion than the ladies of those days; and, as if fearful of the consequences, after many dreadful wounds had been by each party given and received, by general consent they interfered, and divided themselves nearly between them. I observed that every time the mares were driven promiscuously together, as soon as they were left to themselves, all those of the same colour separated from the others, and assembled in parties.

"The manner in which these wild horses are caught is very curious. A great many of them are first hunted into an enclosed place of a circular form, and, when you have fixed on any horse you wish to have brought out, a man approaches with a long hair rope that has a slip knot at one end. They are then driven round pell-mell, the man with the rope running after them, and narrowly watching the horse that is wanted. The moment he sees an opportunity, he flings the rope, which is done with such expertness, that it generally secures him by the neck. He is immediately pulled out by main force, and five or six other grooms, who are always in attendance, running up, in one moment he is so fastened and pinioned on every side, that all resistance is completely vain. An exact list and pedigree is kept of every horse, and the colts are all marked at three years old."

This establishment in the course of the last war supplied the huzzars and light dragoons with upwards of ten thousand horses, for which the emperor allowed a hundred florins each. The annual consumption of oats alone is estimated at 100,000 florins; and three hundred and fifty men (whose number in the spring is augmented to five hundred) are employed all the year round.

The concluding letter in these volumes is interesting and full of matter: after some general remarks on the country and its inhabitants, Mr. Hunter enlarges on the political institutions of Hungary. We have compared this account with that given by Dr. Townson,

\* Mr. Hunter uses the verb singularly after a noun of number: Mr Gibbon, to whose history we are often referred, and from whom, perhaps, this affectation was copied, is at least consistent in the use of it. Mr. Hunter is not so: speaking of the plain of Rakosch, where the kings of Hungary were formerly elected, he says, "I felt while I was beholding it a mingled emotion of veneration and terror: veneration for that awful exercise of power which a people administers when they place an equal on the throne; and terror," &c.

and find the authors agreeing with each other very accurately. The Hungarians do not like their subjection to the Austrian government; the crown of Hungary from being elective, is become hereditary in the house of Austria, whose court is at Vienna. The sovereign seldom visits his dominions, and the inhabitants of Hungary consider their kingdom, blessed with a warm sun and a fertile soil, and containing eight millions of inhabitants, as treated like a paltry insignificant province. It continues yet to be a fundamental law of the land, that every new sovereign, when ascending the throne, shall solemnly swear to the nation to grant them their rights. In the thirteenth century Andrew II. in his *diploma* or coronation oath, allowed his subjects to take arms against him if he infringed them. Several of his successors have signed this diploma, and the same is still in use, except that particular article on the subject of resistance, which was erased in the reign of Joseph I. This diploma of Andrew II. is not an unique instance of royal humility, or to speak more accurately, of spirit and vigilance on the part of the people, forming a constitution for themselves.-- Without any formal acknowledgment by the English constitution, of the people's right to take up arms against their sovereign, even in cases of notorious tyranny, the plains of Runnimede and Naseby attest the exercise, and the successful exercise of such a power, when called forth by emergencies. The ancient constitution of Arragon, however, expressly recognised what was called the *privilege of union*. After any violation of the laws, if on application to the king full redress was not immediately granted, the *ricos-hombres de natura et de mensnada*, the nobles of the first rank, the *hidalgos et infaciones*, the equestrian order, or those of the second rank, together with the magistrates of cities might, by authority of their own body corporate, require redress from the king; and in case of refusal constitutionally withdraw allegiance, take up arms to oppose him, and proceed to the election of another monarch. This legal association issued its

mandates under a common seal, and its operations were conducted with regular and established formalities. Its power was successfully exercised by the Arragonese in the case of Alfonso III. in the year 1287. Peter IV. ratified the right in the year 1347; but soon after having defeated the leaders of the *union* in battle, it was finally abrogated by him, and every record was destroyed which had formerly confirmed it.\*

The government of Hungary is divided between the king and the nobles; the burghers and peasants are excluded from all participation. The king declares peace and makes war, creates nobility, pardons criminals, and convokes diets, but has only a *veto* in legislation: he has the gift of the great offices in church and state, those of the palatine† and keepers of the crown excepted.— The executive government then, of the kingdom, is in the hands of the sovereign; but the raising of supplies for carrying on war, &c. belongs to the nation, who can only grant them in a diet; what in England would be called the *people*, however have very little share in the constitution of the diet. The deputies of the fifty-two counties into which this kingdom is divided, are only the deputies of the nobility; and the *populus*, as they are called in the public acts which are in Latin, are the privileged aristocracy; that is, the nobility and higher clergy. What we should call the people, namely, the body of peasantry and citizens, are contra-distinguished in the public acts from the *populus*, being very emphatically and very truly styled the *misera contribuens plebs*. These burghers and peasants, the *misera contribuens plebs*, who are scarcely removed from without the verge of vassalage, defray all the ordinary expences of government, whilst the nobles, who legislate and tax them, are exempt from all public burdens: they enjoy moreover the exclusive possession of every post of honour, emolument, and trust: they are exclusive owners of the soil, except what lies within the precincts of the free-towns: and are privileged as to their persons, except for high-treason, mur-

\* See Robertson's History of Charles V. vol. i. note xxxii.

† The palatine is elected by the diet from among four candidates, recommended by the king. "This office, which generally lasts for life, is as ancient as the monarchy, and in rank is next to the throne. The palatine governs in the absence of the king: is generalissimo of the kingdom: supreme judge of Slavonia and Dalmatia: and judge and count of the Cumanians and Jazyges. His salary is only 20,000 florins, but his power and patronage is very great. The ban of Croatia is the next in precedence."

der, robbery, and a few other crimes: and lastly, they cannot be arrested till *after* trial and conviction!

A sort of feudal return to government is made for these immunities.—When their country is invaded, the nobles are bound, at the requisition of their sovereign, to take the field, accompanied, according to the extent of their estates, by a certain number of combatants, who are maintained at their expense any where within the bounds of Hungary. Mr. Hunter says, that during the Turkish wars this was a severe and expensive duty; but since the expulsion of the Ottomans, and the mode now universally adopted of maintaining standing armies, it has been attended with scarcely any inconvenience.

The burghers are not so much exposed to the oppression of the nobles as the peasants are, who are bred on their estates, and pass their lives in their service. The situation of these latter, however, bad as it is, has been much ameliorated within the last half century. In the year 1764, the empress Maria Theresa published an *urbarium*, abolishing many ancient usages, and defining the rights and duties of master and peasant, but still they continued under the *glebe adscriptio*. In the year 1781, Joseph II. suppressed the villanage of the peasants in Bohemia and Moravia, and extended it to Hungary in 1785.

The peasants are divided into different classes, according to the quantity of land they occupy on their master's estate. A peasant of the first class is the occupier of what is called an entire farm, which consist of twenty-four acres, besides an additional acre which is allowed for his house, gardens and barns. The general mode of paying rent for this land is by personal labour, and by giving up to the landlord a certain portion of the produce. He is bound, for example, to work fifty-two days in the year, with a cart and two horses, from sun-rise to sunset; in addition to which he must deliver to his master a ninth part of the fruits of the earth, and of his live stock. From this tax his garden is exempt. If the peasant dies without an heir, his property devolves to the landlord. The annual contribution in Hungary, including the Banat and Croatia, amounts to about 4,400,000 florins, of which the peasants pay upwards of 4,000,000: the residue is levied on the burghers!

Hungary is at this time peopled by Hungarians, Slavonians, Germans, Wallachians, Rusniacks, Illyrians, Armenians, Greeks, Jews and Egyptians. It is a very remarkable circumstance, mentioned by Mr. Hunter, that though inhabitants of the same country, and governed nearly by the same laws, these people seldom intermix, but in general preserve their own peculiar habits, institutions, and pursuits, in their original purity.

Among the hundred plans of reformation, most of them dictated by a sense of justice and humanity, though many of them wild and visionary in the extreme; among the plans of reformation conceived by the disappointed Joseph II. it was a favourite one to amalgamate, as it were, all the subjects of his hereditary dominions: he proposed to govern them by one uniform system of laws; and in one of his mandates required that at the expiration of three years, all public business should be transacted in the German language! Perhaps nothing is more difficult than the introduction of an uniformity of language among different people: William the Conqueror endeavoured to circulate the Norman French among his English subjects, and a little of the jargon yet tingles in some of our ancient records; but if William was unsuccessful, what chance could Joseph have to teach uniformity of tongue to the discordant progeny of Ham, Slavonians, Greeks, Jews, Turks, and Wallachians? The consequence of so violent an attack upon the most ancient and deep-rooted prejudices of the people was such, as ought to have been anticipated: the whole kingdom was thrown into a ferment, and rebellion was frequently on the point of breaking out. Poor Joseph! on his death bed he was obliged to cancel, with his own hand, the acts of his whole government, except that for the suppression of the *glebe adscriptio*.

On the accession of Leopold II. to the throne, many excellent articles were agreed on by the diet; the liberty of the peasants is confirmed and enlarged: Hungary enjoys the most complete toleration in matters of religion: public offices and seats in the legislative council are open as well to the protestant as the catholic: and no one is obliged to contribute towards the support of any form of religion which he disapproves; so that, with all its complicated system of

oppression, Hungary grants some privileges and exemptions, of which even certain free nations cannot boast.

A neat map of the author's route is prefixed to these volumes, and a portrait of Semlin III.

ART. XV. *Travels through France and Italy, and Part of Aus'rian French and Dutch Netherlands, during the Years 1745 and 1746. By the late Rev. ALBAN BUTLER; Author of the Lives of the Saints.* 8vo. pp. 472.

"THE letters from which the present publication is formed, were written by the Rev. Alban Butler, (the author of the *Lives of the Saints*) during his travels with the Honourable James and Thomas Talbot.

"On the perusal of them, with a view to the present publication, it appeared that they were not intended for the press, but rather as outlines for a more perfect work, being in many parts little else than mere jottings, the meaning of which it was frequently difficult to decypher; they are therefore printed with considerable alterations, which are however principally confined to variations in the style, and to the deletion of a few unimportant paragraphs. To render obvious the meaning of the author has been the principal aim of the editor, without attempting to render the phraseology agreeable to the modern standard."

On reading the title and advertisement of this volume, we took for granted that a posthumous work, apparently never intended for publication, describing a journey performed near fifty years ago, through that part of Europe which is the most visited, and therefore the best known, must possess some rare merit or extraordinary information, to occasion its being committed to the press under such forbidding circumstances. We have therefore carefully perused the work before us, and can pronounce it to be sufficiently well written, in the style and manner of other travels of the same period, but containing no peculiar information, except concerning the religious foundations and sacred reliques of the towns through which the author passed. The changes that have since taken place in Flanders, France and Italy, render this volume of no sort of use to the modern traveller: its value must therefore depend on its being a faithful history of the ecclesiastical state of these countries at the time when Mr. Butler visited them. Of its merit in this respect we are not very good judges, neither can we ascertain what degree of interest will be excited by this kind of information in those who are of the Roman catholic communion; but we fear that the protestant reader will not derive from this volume either much amusement or edification. As a characteristic speci-

men of the work, we select the following extracts:

"Here also is shewn the head of St. Magdalene in the gold case above described, which is enriched with great jewels. Before it is the statue of Ann of Brittany, queen of France, of enamelled gold, very beautiful, though small. She is praying upon her knees upon a pedestal, upon which are two angels supporting the case: this was the present of that queen. The head of the saint, and all its bones, are prodigiously large. It has in its aspect an extraordinary air of majesty, very agreeable. On the left side of the forehead is a piece of flesh uncorrupted, which they call the *noli me tangere*; and say it was preserved incorruptible, because our Saviour touched it with his finger when he bid Mary not touch him. But for this circumstance no good authority is alledged. Two facts at least regarding this flesh are however well attested. A person being desirous to cut off a small piece of it, to put in a reliquary, the flesh which before was dry, immediately on being cut, appeared red with fresh blood; as the verbal process, and the attestations of the physicians called to examine it, confirm. The second remarkable fact alluded to happened thus: The *Chambre de Comptes*, at Aix, (a sovereign court) has upon the death of the king a right to examine all relics, to ascertain whether they are in the same condition as upon the last king's death. Three of these counsellors, prepossessed with the notion that the above circumstance was a cheat, resolved to discover and abolish it. Accordingly, on the death of Lewis XIV. making use of their privilege, they went to St. Maximin's with surgeons and apothecaries from remote towns, suspecting those of the place. These they commanded to examine the piece of flesh even by cutting, and to employ the strongest menstruums to separate it from the bone. But all had no effect; the surgeons cried out, "A miracle!" And the three counsellors were seized with so great fear, that they immediately begged pardon of the prior and the religious; and by way of reparation, or *amende honorable*, drew up and subscribed a judicial attestation of what they had witnessed, and became the most zealous defenders of the truth of these relics; as two of these gentlemen, yet alive in Aix, still continue to declare themselves on all occasions."

"Near it is a church called the Holy Cross in Jerusalem, built by St. Helena after she

had discovered our Saviour's cross, and restored by Gregory III. and Cardinal Mendosa, when the title of the holy cross was found under the tribune of the holy altar, in a cavity in the wall. Constantine the Great bestowed on it great riches and costly ornaments, chalices, censers, &c. of pure gold, fully enumerated by Onuphrius: Four marble pillars support the tribune, and under the high altar lie the bodies of SS. Cæsarius and Anastasius, martyrs; and behind it, on the vault over the choir, is painted, in various pieces, the whole history of the *invention* of the holy cross, by Perugini: The paintings are very good and fresh, though old: It is forbidden to any woman to enter the subterraneous chapel, except on the day of the dedication of the church, the 20th of March. We are informed by an inscription, that under the pavement of this chapel is deposited earth brought by St. Helena from Jerusalem and Mount Calvary, and which lay

under the cross, and was moistened with our Saviour's blood;—whence this church is called, in Jerusalem, as standing on earth brought from that city. At the altar of this chapel nobody can say mass but the pope, nor does he himself use that privilege oftener than once a year. In a tribune on the right hand, are shewn on Good Friday, the principal relics kept here; which are,—a vial of our Saviour's blood; the sponge by which vinegar was given him to drink; one of the brass nails with which he was crucified; three pieces of our Saviour's cross, with the title in three languages, which was put over his head, adorned with gold and jewels &c.; also some of the cross of the good thief."

We are inclined to suspect, that part of the account of Italy at least is translated from some French work, from the repeated mention of the emperor *Gallien*, and the ecclesiastical historian *Rufin*.

ART. XVI. *Journal of a short Excursion among the Swiss Landscapes, made in the Summer of the Year 1794.* 8vo. pp. 132.

THE first paragraph of this volume provoked from us an indignant exclamation at the affectation of the author's style, and the impertinence of publishing unconnected and unimportant memorandums.

"Left Lausanne on Tuesday morning the twentieth of May, before five o'clock, on a tour that I had often wished to take, merely to see the face of the country—The morning calm and fine; all the opposite side of the lake washed or thick-plated with sun-beams—The pea-green pastures of Savoy, its woods like the tufted moss, and its rocks above with their dishevelled snows all swelled out to view, seeming to have advanced nearer this shore than during winter—Pleasing state of mind from the recollection of the walks I had taken here, the tea-parties at the Champ-de-l'air, the dances, &c. at Lausanne the last season."

This same impertinent indolence characterises the whole journal, which has been printed, as it appears, without alteration or correction: but the author is evidently a man of quick observation and lively fancy. Such a work can only be judged from samples of its character; let us take his general description of the Valois:

"It does not interest so much by its harmony, proportion, or divine expression, as by the opposites of these; a confusion of all order: '*monstrum horrendum, informe, ingens, cui lumen ademptum est!*' It rouses our attention by shocks; by being curious, grotesque, odd, seemingly contradictory to nature: and by these more palpable qualities it excites the wonder and surprise of children even; which we all are indeed at least half

of our lives. Thus we are constantly remarking or expecting some uncommon height, length, or breadth; some rare appearance; something that terrifies, as of imminent destruction to itself, as well as to the beings on it; or traces of this in past times. And if upon occasion it presents the image of Paradise here and there, it is only to heighten by contrast the surrounding chaos.

"To form an exact idea of it, you must suppose any country whatever, disjointed and broken to pieces by an earthquake; then suddenly thrown together again in a heap—you must then fancy this heap to have become in process of time coated over with trees, mosses, and verdure of all sorts; while cabins, single or in clusters, have been crumbled over it—that the rivers after several falls have gained a more level channel, and passing in their course through several wide and deep chasms, have filled them up, composing thus so many extensive lakes; such is the country we have been going over these seven or eight days past, and are to expect for as many days to come; those rivers just mentioned serving as a clew to guide us, in a most wonderful manner, through this labyrinth of nature.

"In these regions the traveller sees (or thinks he sees) the utmost violence done to the component parts of landscape that can be imagined—Clouds sinking or groveling on the ground; while whole plains are slung up several hundred fathoms into the air—On the topmost pinnacle of these again, a lake weaves its ample web. Precipices cut abruptly down under market towns, with their massive churches upon them, which however stand unshaken, and fearing no harm. Pastures, with their herds and flocks upon them, hung up like a map; and rivers staggering along at a height, that we must call philosophy to explain how they could ascend

there; often convulsed and half-strangled between two rocks—often at a cleft abandoning their brittle fluid to the void, through which it passes to the bottom, where it is shattered into a cloud of fragments.

“Sometimes he sees, the reverse to the poet’s image of a downward sky, reflected from a pool of water, an upward earth, not fictitious like the other, but with real shrubs, if not trees, stooping down from it; or he hears a noise like artillery, or like subterraneous winds or waters, and a mass comes down along the valley, to which forests of fir are reeds only, and houses or villages but cobwebs.

“The works of nature in sport giving awkward and rude likenesses of the works of man: as when rocks take the semblance of castles with turreted towers, or of obelisks, winding stairs, domes, corridors: or as when stuck round with pines that rise perpendicular like so many parallel columns, order above order, the whole forming a sylvan amphitheatre; above our road rivulets dropt straight down into the deepest valleys, fathoming them like a plummet line.

“Various soils crowded together, various climates suddenly succeeding each other—mixture of seasons; snows rising refreshed from the bosom of summer; and in the lap of bleakest ice aromatic herbs and glad strawberries brightning—and of a sudden the ground gives way, when a river in its full magnitude sinks down; nor is its course to be followed but by the ear long afterward; late rising of the sun, and early setting of it.

ART. XVII. *A Tour through several of the Midland and Western Departments of France, in the Months of June, July, August, and September, 1802. With Remarks on the Manners, Customs, and Agriculture of the Country. By the Rev. W. HUGHES. Illustrated by Engravings. 8vo. pp. 238.*

THE last war had occasioned so long an interruption of intercourse between France and England, that when the door of communication was opened between the two countries, many would pass through it on business, and more from curiosity. To visit France was to visit a new country: the manners and customs of the people, and the appearance of towns and villages, were so changed by the revolution, that every one was eager to amuse his friends; and many thought themselves qualified to amuse the public with an account of modern France. In consequence of this communicative disposition, the press has teemed with “Trips,” and “Excursions,” and “Parties of Pleasure” to Paris: Mr. Hughes makes his appearance under the graver and more comprehensive title of a tourist, and as he tells us that he passed four months in the country, if our expectations, therefore, were too highly raised, the fault was his

“Insulated spots of verdure enveloped by rocks; (so many sweet kernels within their shells) putting him in mind of Philip Quarl’s fruitful islands, sequestered far in the solitudes of the ocean, and destined to remain for ever untouched by man.”

The account of the baths at Loercherbaden was new to us.

“I saw numbers of men, women, and even children, that had come a journey of some days, and were here at a heavy expence, doing penance for their high living, and want of exercise. They must sit in hot water for three weeks; whoever first has red pimples breaking out upon them, and in the greatest number, is considered as having first found grace with the divinity here. (But what a worship this, for children to be initiated into!) By way of strengthening the constancy of these Gentoos, there are little floating tables contrived, on which they are presented (but not in the manner that Tantalus was) with fruit, wine, coffee, novels, and whatever meats they like best. The coming to these baths is at last considered absolutely as a party of pleasure. I own I could not but think this a strange refinement in epicurism, to be thus hugging its sin in the very act of chastising itself.”

We have no volume that communicates so lively an idea of Swiss scenery as this hasty journal. The author is a blind admirer of Rousseau, and a very indifferent philosopher.

own for letting us into the secret. By the preface, however, we are opportunely prepared for a descent, for the author says honestly, that his work “is neither more nor less than a series of memorandums and reflections penned sometimes upon the road, sometimes at the inns upon it, and that it commonly partakes of pain and pleasure, of admiration and disgust, and is tinctured with the lassitude and feeble exhaustion of the weary days on which it was written.” We are moreover informed that it was intended for the fugitive pages of a magazine; and when it was afterwards determined to bring it before the public in a more grave and ceremonious manner, the author would have corrected his plan and rendered the construction of his sentences less faulty, had not the immediate return to the continent which he contemplated, rendered it utterly impracticable.

All that Mr. Hughes has noted down must have been the result of mere observation, for we suspect he is utterly ignorant of the French language, and of course one fertile source of information was dried up, namely, conversation with the inhabitants. Mr. Hughes is fond of introducing French words and phrases; and we may fairly suspect his utter ignorance of the language, when we find that he does not spell the commonest words correctly, and that different genders are jumbled together with whimsical confusion. Among a great many other instances of false spelling and false syntax, we remember, aubergiste for aubergiste, capitaine for capitaine, bon bierre for bonne bierre, bon eau for bonne eau, &c. Nor is the English itself at all times so accurate as it doubtless would have been, had Mr. Hughes corrected it at his leisure.

Our tourist landed at Dieppe, which is represented as the sink of filthiness and the picture of misery. From Dieppe he proceeds to Rouen, where he staid a month, and of course had every opportunity of examining the city with attention. The only thing worth delaying us here is the description of a very singular floating bridge over the Seine. It consists of several barges of great burden, which are first arched over, and paved with large stones of granite, then towed into a right line and moored side by side, with massy chains to retain them in their places. It follows from this inconvenient construction, that if a vessel is bound up the river, or to sea, one of these barges at least must be displaced to give her a passage: this is the work of many hours, it seems, and consequently is performed but at stated intervals! There was formerly a bridge of stone across the Seine at this place, which was swept away by the floating ice, and repaired and destroyed again; these circumstances occasioned the adoption of the present cumbrous machinery: it is said that the annual expence of repairing these barges, would be fully adequate to defray at least one-third of the expence of replacing the erection which has been carried away. There are some noble buildings at Rouen; the churches of Notre Dame and of St. Owen are mentioned as particularly fine: the city itself is filthy, and the streets narrow. The markets are spacious and well supplied. From Rouen Mr. Hughes proceeds to Caen; thence to Sable and la Flèche, where

he learned some interesting revolutionary anecdotes, which are detailed at very ample length to the reader. Angers is situated just below the confluence of the Sarthe and the Mayenne: it is on the borders of la Vendee, and became the theatre of a most dreadful drama.

"For a considerable space of time, not less than 30,000 cartridges were daily distributed among the inhabitants, hemmed in on every side, and absolutely on the very brink of famine;—from the windows of their houses, from the ramparts on which from time to time they took their busy stations, they gazed on the fields which their own hands had sown, on the vineyards which they had pruned and cultivated, loaded with the richest abundance, and serving, like water to Tantalus, but to aggravate the pining misery which consumed them!

"One mournful morning being driven to desperation by their necessities, they rushed furiously out of their prison upon their besiegers—alas! a few of them returned again ere long leaving behind them the slaughtered remains of no less than 800 fathers of families, to say nothing of the youths and unmarried men who fell also in this day's horrible carnage!—the dreadful distress of the evening can only be conceived by those who have witnessed similar scenes! within, without—all was horror and consternation!—one mingled uproar of heart-rending cries and lamentations, and of triumphant shouts from which the shuddering soul of humanity recoils, filled the air;—unsated with blood in the field the victors pursued the flying multitudes to the gates, hewing them down with relentless cruelty, and deaf as adders to the cries and groans with which they begged for quarter—multitudes were of course cut off from retreat, and had nothing to do but seek for refuge in the fields, the vineyards, and the woods!"

"Look, (says Mons. La P—) across the Loire on which we are now standing! for twenty leagues square there is not a field in which human blood has not been shed!—Not a town, not a village, not a cabin, not a roof has been spared!—In one undistinguished desolation all is laid low!" Sincerely do we hope that the British government may not have been so deeply guilty as is here insinuated: but the testimony of one of our own county justices proves, that we were not guiltless of the mean, disgraceful, and nefarious forgery of French assignats. (See cases at *Nisi Prius*, by Isaac 'Espinasse, Esq. page 389, Strongitharm *versus* Lukyn.)

From Angers Mr. Hughes proceeds to Tours, thence to Orleans, and Paris.

It will be recollected, says he, that, at Orleans, the British name was tarnished with indelible disgrace by the infamous destruction of the female enthusiast, Joan of Arc, who, being taken prisoner, was burnt in the market-place, &c. Mr. H. is as unlucky in his history, as he is in his French: the maid of Orleans was executed in the market-place at Rouen. At Paris,

"The first business in the morning, after the traveller has somewhat surmounted the fatigues of his journey, is to find out Mons. Perageux, in order to change his paper into *aurum palpabile*. This gentleman is presently found out on the Boulevards, living in a palace, the view of which carries a sort of presentiment to the heart of the squeezing which awaits the purse. Papers being produced, and the accustomed preambles gone through, Mr. P.'s representative asks you in what you will be paid—paper, silver, or gold? Not being as yet up to the tricks of the trade, you incautiously reply "in Louis." Well, in about five minutes, my gentleman having gone to another office for the cash, returns. "The course of Exchange is so and so against you (about five per cent.); and, as for the louis, we purchase them for the accommodation of travellers; you have, therefore, to lose one per cent. more on this account." To crown the whole, having been feathered thus of six per cent. you withdraw with your precious pieces; but, no sooner do you present one of them for payment, than out comes the scales and weights; they are generally light, and you have the further satisfaction of losing from threepence to fourpence-halfpenny more upon most of them."

And does Mr. Hughes mean to bring forward, seriously and deliberately, such a charge of extortion against M. Perrégaux? We know that this gentleman is one of the first bankers in Paris, both as to reputation and to rank: his house is the resort of all those English who carry him letters of recommendation: he has acquired their confidence, and stands high in their estimation. His table is open to them; there they are received with hospitality and elegance, and enjoy the pleasures of his agreeable

and sagacious conversation: where he can be of service, his attention to them is unremitted, and his influence at the offices which respect foreigners is always ready to be exerted in their favour. The manners of M. Perrégaux are polished, his mind is cultivated, and his judgment is matured: *we know* that he is respected in London, in Paris, and in several different departments of France, where he has connections. If Mr. Hughes asserts that he has himself been cheated by M. Perrégaux, we certainly are not prepared to contradict the fact, but we should be deficient in justice not to avow that we have several times exchanged the circular notes of Sir Robert Herries, for louis d'ors and six-livre pieces, at the bank of Mr. P.; that he never charged us one sous per cent. for the accommodation of louis; and that so far from his six and twelve livre pieces being generally deficient in weight, a single instance of such deficiency does not occur to our remembrance.

Mr. Hughes leaves the task of describing the public buildings, the libraries, the galleries, the museums, &c. to others; and confines himself to a description of the filthy manners of the inhabitants. He seems to have been particularly struck with the indelicacies of the Parisians, and has related them with such careful minuteness, as to give no very high idea of the refinement of his own taste. We have remarked that Mr. H.'s descriptions are generally extravagant; he labours to be very droll and humorous, and occasionally succeeds in raising a laugh: but it is not unfrequently at his own expence.

With some common-place remarks on the French hierarchy, under the old regime, and a sort of comparison between the state of agriculture in France and England, evincing no extraordinary knowledge of the subject, this volume is brought to a conclusion. It is altogether a pert uninteresting performance: the style of it is very familiar and very vulgar.

ART. XVIII. *A Rough Sketch of Modern Paris; or Letters on Society, Public Curiosities and Amusements in that Capital, written during the last two Months of 1801, and the first five of 1802.* 8vo. pp. 319.

AFTER having accompanied Mr. Hughes in a barren, uninteresting tour, we feel quite revived at being introduced to the society of a gentleman whose taste is cultivated, whose mind is inquisitive,

and who communicates the information he has acquired in an easy, graceful manner.

The first objects of curiosity to which a man of taste directs his steps, after his

arrival at Paris, are the *Thuilleries* and the *Louvre*: in the latter is deposited the finest collection of paintings and of statues in the world. Into this noble museum we are immediately introduced. No one who has not had the good fortune to see this gallery, can imagine how powerful is the impression, how sublime and delightful is the sensation produced on entering this saloon, thirteen hundred feet in length; and on the walls of which are suspended one thousand paintings, many of them of very large dimensions, the workmanship of *Raphaël*, of *Rubens*, of *Guido*, of *Titian*, of the *Carracci*, of *Leonardo da Vinci*, of *Corregio*, of *Albano*, *Domenichino*; in that of all the first masters of the French, Flemish, German, and Italian schools. The perspective is most enchanting! The attention, however, is soon dissipated among the splendor and multiplicity of the paintings, and the difficulty of fixing it on a few select pieces is by no means inconsiderable. Our author seems to have felt this difficulty, notwithstanding the administration of the *musée* has so judiciously arranged the painters; particularly those of history, following the chronological order of their birth, that the pictures of each master are as much as possible collected together, and the comparison of school with school, of master with master, and of the same master with himself, is very much facilitated; he felt this difficulty, and has given us much too brief and general an account of the gallery. The *Saint Jerome* of *Domenichino*, with which he seems to have been so particularly struck, is, indeed, an extraordinary production; we perfectly recollect the countenance of the dying old man. Arrived at the age of ninety-nine years, and seeing his last hour approach, *Saint Jerome* caused himself to be carried into the church of *Bethlehem*, where he had been accustomed to celebrate the holy mysteries. There, placed at the foot of the altar, he summons all his strength, in order to receive, on his knees, the viaticum, but exhausted by fastings, age, and illness, it is unequal to the last effort. Vainly does he attempt to raise his arms, that he may clasp his trembling hands; the coldness of death has already seized his extremities, the relaxed muscles and the stiffened joints are no longer

obedient; his arms are motionless, his knees bend, and sinking under the weight of his body, he again falls backwards. In this state of feebleness and agony, the little life which yet remains to him, seems altogether concentrated in his eyes, and on his lips, that eagerly implore the sacrament which the priest is preparing to administer. He, clothed in the sacerdotal habit of the Greek church, advances towards the holy man, in order to communicate; with one hand he holds the host on the patine, and with the other he strikes his bosom, as he pronounces the sacramental service. Near him the deacon, standing, in the dalmatic vestment, bears the chalice, ready to present it when he shall have received the eucharist: and before him the sub-deacon on his knees, holding in his hands the missal. The assistants participate in this pious ceremony: one supports behind the fainting old man; another, on his knees before, wipes away the tears which his situation has extorted. On his left hand *Saint Paulina* prostrates herself, in order to kiss his hands: all seem moved by the affecting scene.—The composition is completed by a group of angels hovering above in adoration.\*

From the gallery of paintings we are conducted into the statue gallery. Our author thinks that the *Apollo Belvidere* is not now seen to the greatest advantage, the room not being either high or large enough, and too many statues being crowded together. We are of opinion also that the *Apollo* is not seen to the greatest advantage, but for a different reason: as the *Apollo* is not a colossal statue, the room seems to be quite lofty enough, and large enough for the purpose; nor is its effect by any means diminished by surrounding statues, over which it is elevated by a pedestal on a perron, two steps high, so that it produces a striking impression even from the hall of the *Laocoön*. The *Apollo*, indeed, is by no means crowded by other statues. The further end of the saloon, if our memory does not deceive us, is railed off from side to side; in front of the railing, and near to it, there are but four statues; by the left wall stands the *Mars Victor*, of *Pentelican* marble; to answer this, on the opposite side stands the *Hercules*, and *Telephus*, or

\* We have translated this description from the "*Notice des Tableaux*," &c. which is sold at the gallery: it is interesting in itself, and serves to shew the nature of that catalogue.

the *Hercules Commodus*, as it is usually called, a statue from the Belvidere: between these, and nearly on a line with them, are two *sphinxes*, of red oriental granite, from the Museum Pio-Clementinum. Between the *sphinxes*, and behind them, forming as it were the apex of a triangle, stands the Apollo, separated by two beautiful pillars of red oriental granite, from the *Venus of Sirles* on one side, and the *Capitoline Venus*, a statue of most exquisite Parian marble, on the other. These pillars are answered by two others at the opposite extremity of the saloon, on either side of the entrance from the hall of the Laocoön. There are no other statues which at all interfere with the Apollo; for as to the *Indian Bacchus* on the right hand wall, and the small statues of *Juno* and *Melpomene* on the left, they are too distant to disturb the attention. The objection that we have to the position of this statue is, that it is impossible to examine it from one point: the front view of it is fine, but we can take no stand on either side or behind it. In the gardens of the Thuilleries one can walk round the statues, and examine them in every possible position. We do not mean to insinuate by this that the gardens of the Thuilleries would be a proper place for the Apollo, the Laocoön, or the Capitoline Venus; certainly not, on the contrary, it is quite melancholy to see the mutilation and other injuries which many fine statues have there received from exposure; but we do not approve of concealing half the workmanship of a statuary by placing the production of his chisel close against a wall.

It is time to quit the Louvre. The following account of the state of society in Paris is very curious.

"As to society, it appears to me, that there are three great divisions, or principal classes, at Paris. The first, in point of antiquity, and perhaps still of public opinion (for notwithstanding all the laws to the contrary, family prejudices are as strong as ever in France), is that of the *ancienne noblesse*, who separate themselves almost entirely from the other classes, and live together at the houses of such of their body, as are still rich enough to give assemblies. The second, which I

shall call the governmental set, consists of the ministers, of the counsellors of state, of the ambassadors, of the senators, legislators, tribunes, &c. in short, of all the constituted authorities. The third class is what the pride of the first denominates '*les parvenus ou nouveaux riches*;' consisting of the wealthiest individuals now in France; of persons who, taking advantage of the circumstances which have occurred, have enriched themselves during the general wreck of private fortunes and public credit. Army contracts, national estates, and speculations in the funds, have afforded the means, by which many of these individuals have accumulated overgrown fortunes; but several respectable merchants, bankers, and other commercial men, are unjustly confounded with these, and, under the general name of '*journisseurs*,'\* held up to public contempt.

"The first class are still affluent, when spoken of as a body, though few of them have individually large incomes. A distinguished person, connected with the government, and to whom the most important acts of state have been specially entrusted, assures me, that the old proprietors still hold two thirds of the landed estates of France; though, in consequence of the heavy taxes† laid on them during the revolution, by the loss of their woods, of their feudal rights, and of public offices hereditary in their families, (not to mention the present law of descent, by which all children inherit equally), their incomes, though in different degrees, are, in every case, greatly diminished."

"The second class, which I call the governmental, is the most polite to strangers. The second consul has a splendid party every week; and each of the ministers has a day, to which all foreigners may be taken by their respective ministers, after they have been presented at the Thuilleries.

"Le Brun, the third consul, frequently gives dinners; and English parties, who have been invited, assure me, that they are particularly pleasant. He is a man of great literary acquirements, and the conversation at his table generally takes a superior turn.

"The ministerial assemblies are crowded; but the houses are large, the attendance good, and the uniforms of the constituted authorities, and the full dress of the ambassadors, give altogether a splendour to these meetings, which no others at Paris possess.

"The third class—I mean that of '*les parvenus*,'—if not the most elegant, or the most esteemed, is at least the most luxurious. Nothing can exceed the splendour of the persons of this description. The furniture of their houses, the dress of their wives, their

\* "Contractors."

† Every landholder in France, in consequence of a law passed in one of the most violent moments of the revolution, and which is still continued, pays one fourth of his real revenue to the state; and as, in particular parts of the country, the rate has been unfairly made, it happens, in some cases, that even a half is paid instead of a fourth. The latter is the *minimum* of the present taxation.

table, their plate, their villas, in short, all the 'agrémens' of life, are in the highest style of oriental magnificence.

"To give you some idea of their manner of living, I will describe to you the house of Madame —, which I yesterday obtained the permission of seeing, in her absence.

"The house is situate in a street leading from the Boulevard, and is approached by a fine court, of considerable length. The back of the house looks on a very pretty garden, arranged à l'angloise. It was formerly the residence of a minister of state.

"The drawing room, and *salle à manger*, were not yet finished. The furniture prepared for them was rich. I did not think it particularly beautiful; but the bed room, and bathing cabinet, exceeded in luxury every thing which I ever beheld, or even ventured to imagine. The canopy of the bed was of the finest muslin, the covering of pink satin, the frame of beautiful mahogany, supported by figures in gold of antique shapes. The steps, which led to this delicious couch, were covered with red velvet, ornamented on each side with artificial flowers, highly scented. On one side stood on a pedestal a marble statue of Silence, with this inscription:

*'Tutatur somnos et amores conscia lecti.'*

On the other, a very lofty gold stand, for a taper or lamp. A fine mirror filled up one side of the bed, and was reflected by one at the top, and another at the opposite side of the room. The walls were covered with mahogany, relieved with gold borders, and now and then with glass. The whole in excellent taste. The bathing cabinet, which adjoined, was equally luxurious. The bath, when not in use, forms a sofa, covered with kerseymere edged with gold; and the whole of this cabinet is as pretty as the bed room. Beyond this room is the bed chamber of *monsieur*; plain, neat, and unaffected; and on the other side a little closet, covered with green silk, and opening on the garden, in which *madame* sits, when she amuses herself with drawing. To conclude, I find the 'loves,' which 'Silence guards,' and of which this paphian seat is the witness, are those of January and May; for the wife is twenty (the greatest beauty of Paris), and the husband something less than sixty."

In letter VI. we have an interesting account of the Abbé Sicard's institution in behalf of the deaf and dumb. Our author was present at an extraordinary meeting, and heard the abbé examine some pupils.

"There were forty or fifty children present," says he, "born deaf and dumb, who were, by the wonderful skill and unceasing care of the respectable abbé, restored to society, to happiness, and themselves. They were seated in different parts of the room,

and conversed with each other by means of their fingers, which were in constant motion. They had every appearance of enjoying good health, spirits, and vivacity. There are all kinds of workshops, manufactories, and schools, in the house of the *sourd-muetes* and the establishment is entirely maintained at the expence of the government."

At a *thé*, or evening party, we have a good specimen of the pedantry of Parisian society; Shakespear is unanimously voted to be no poet, and Mr. Fox no orator. It happened soon after that our author was present at a sitting of the tribunal, in the Palais Royal, when a debate took place on presenting the *code civil*; the same subject which called forth the eloquence of Portalis, when he presented the measure to the *corps législatif*. The subject was an important one, and five or six members had put down their names as intending to speak.

"Nothing," says our author, "could be duller than these speeches, every one of which was read from a written paper. A very ridiculous circumstance arose from this manner of speaking; as each of the discourses had been previously prepared, there was no reference to the arguments used in the debate, and the advocates and opposers of the measure equally disregarded and left unanswered the remarks of those who happened to precede them in the debate."

Admirable judges of oratory!

In this amusing volume we have very ample accounts of all the public establishments at Paris; the respective merits of the different theatres, operas, and performers; we have an account of the different libraries, cabinets, gardens, and museums, of every description; and the concluding letter gives a general view of Paris, principally taken as compared with London. The hospitals and asylums of the former metropolis, as well as of the latter, are numerous, well endowed, and well regulated; they have not been neglected during the united horrors of war and revolution; and our author was assured, by a respectable physician, (not a Frenchman), that even during the most barbarous moments of the sanguinary Robespierre, those useful establishments were not abandoned. We have already mentioned the Abbé Sicard's institution for the deaf and dumb; our author was present at a sitting of the establishment formed for the protection and instruction of the blind, which was scarcely less interesting.

"At the '*séance*,' or public meeting, which I attended this morning, I saw sever-

ral persons, men, women, and children, either born blind, or rendered so by illness, now able to read, to write, to count, to print, and to perform on different pieces of instrumental music. The mode by which they read is by feeling the letters, which are purposely raised on card; and they did so with such rapidity, that it was difficult in hearing them to discover their misfortune. What particularly struck me, was the ingenuity of a blind woman, who had taught her child to read, an infant about five years old, not afflicted with this calamity.

"There is a manufactory of steel carried on in the building, in which the blind turn the wheel; and they also make whips, writing cases, purses, and paper toys of all sorts, which are sold for their private emolument. There is likewise a press, or printing machine, in which the whole process is performed by the blind; and I am told, books published by them, are more than commonly correct. The women knit, sew, and perform other kinds of needlework; and all of them either sing, or perform on some instrument. They gave us a kind of concert, which, if not very good, proved, at least, that they understood the principles of music."

The apathy which prevails among the people of Paris, as to all public events, is scarcely credible; a splendid fête was given in honour of the preliminaries, and of the anniversary of the consular government; a dead calm prevailed among the spectators, they looked on, walked about, and seemed entertained with the shows that were exhibited, yet no cries of triumph, no shouts of joy, expressed the public satisfaction! Some time afterwards the sound of cannon announced the news of the signature of the definitive treaty; the façade of the Thuilleries, its garden, Les Invalides, and the hotel of the minister of marine, were all speedily illuminated.

"It grieves me to add," says our author, "that this important intelligence has produced no effect at Paris. It has scarcely been mentioned in society; and I have walked about the whole evening, admiring the taste with which the public buildings were lighted, and heartily joining in the satisfaction which occasioned them, without meeting one single group of French spectators."

The same indifference was apparent when *Te Deum* was sung at *Nôtre Dame*, in honour of the peace, and the re-establishment of religion. During the illumination there was no noise, and indeed no expression of joy; very few people were seen in the Thuilleries, though the weather was fine, and the day Sunday.

"The more I see of the French," says our author, "the more I am astonished and disgusted at the indifference which they

have contracted; their dulness is the more disagreeable from its being unnatural, and I cannot help exclaiming with Voltaire,

Que je plains un François, quand il est sans  
gaieté;

Loin de son élément le pauvre homme est  
jetté."

Indeed the character of the French seems to have undergone a considerable change; in their private societies they display but little of that vivacity which formerly distinguished them; it is now the affectation to converse on literary subjects, and he that has the most volubility and assumes the most imperious tone of authority, has the best of the argument. From the account before us we gather that there is no restraint on conversation at Paris; persons in high office are spoken of with an asperity and freedom which even in this country would be considered as imprudent; indeed the government has much less jealousy of this sort than we are taught to imagine. Our author attended several of the courts of justice: causes seem to be as well conducted as they can be without a jury, which however is now introduced, it seems, in capital offences. An Italian was lately convicted of assassination; he underwent the punishment of the guillotine, being led to the scaffold in a red shirt, this disgrace being added to the sentence in cases of murder.

"I ought to mention," says our author, "in honour of the present criminal laws of France, that this is the first individual who has been condemned to death during the six months which I have passed at Paris."

Although we have devoted considerable space to this little volume, it contains so much authentic and interesting information, concerning the manners and amusements of the Parisians, as to be amply entitled to that attention which many bulkier volumes merit not. We shall, therefore, make no apology for extracting from the concluding letter some parts of the comparison which it contains between the state of Paris and of London. After having noticed several petty distresses which an Englishman is more particularly susceptible of, our author proceeds thus:

"I must be permitted, however, to observe, that there are reasons of a much more serious nature, which make the English less easy to please than other foreigners. We come from a country where all the arts are carried to a degree of perfection, at least equal to what is attained on the same objects in France, and where, in many things, the ingenuity of our manufacturers is unrivalled.

In science and literature we have not been compelled to look from home; and while we now admire the many distinguished writers which France has produced, they are not our only models, and with Locke and Newton, Milton and Shakspeare, we cannot pay that unbounded homage to the genius and learning of our neighbours; which they are apt to demand. The freedom and excellence of our constitution accustoms us to a degree of unrestrained conversation seldom met with at Paris; and the general diffusion of wealth in London, has introduced, among all orders, a degree of comfort which is seldom found even in the proudest houses of the French capital.

"The beauty of our women, and the delicacy of their behaviour, render us less enthusiastic admirers of Parisian belles, Parisian fashions, than the strangers of other countries.

"The perfection to which the stage has advanced in London, and the splendid manner in which our theatres are lighted, prevents our being greatly struck with the renowned spectacles of this place; and the taste, profusion, and magnificence, displayed in our private entertainments, oppose too powerful a contrast to the gayeties of Paris, to allow us to be much delighted with the latter. Our race of horses, and our manufacture of carriages, are both too perfect to render it possible for us to admire the wretched equipages which are here considered as the *acme* of elegance. It is equally impossible for us to praise the gardens of the *Thuileries*, the *Champs Elisées*, or the *Bois de Boulogne*, as long as we remember Hyde Park, or Kensington Gardens. Nor can the lighting and paving of Paris excite the admiration of those who have been used to the comfortable *trottoir* and brilliant lamps of the streets of London.

"Having thus stated the reasons, good and bad, for the tameness with which Englishmen often speak of Paris, I shall endeavour to divest myself, as much as possible, of national prejudice, and to lay before you the advantages and disadvantages attendant on a residence in this city.

"In respect to literature, the arts and sciences, certainly every opportunity is offered which knowledge can afford, or which a zeal for letters can desire. In this respect I think Paris is superior to London. Besides the immense acquisitions which it has lately made, and the great and wonderful collections that are constantly open to the public, there are so many private institutions within the reach of men of moderate fortune,

that this city would soon rival all the universities of Europe; did not the pleasures of the place hold out temptations dangerous to the morals of youth.

"Literary men also are more respected than in England; and, instead of abandoning society (which is too much the case with men of learning in our country), the industrious, but unprotected Frenchman, who engages in the career of letters, finds his way into the most brilliant circles of the capital. Even the haughtiest of the old nobility admit into their most intimate *coteries*, those who have attained any literary fame, however low their origin, or however mean their appearance. On this head I have given unqualified and unrivalled praise to Paris."

"As to society, that material ingredient in the happiness of man, of which every one who has a head or heart feels the vast importance, I conceive that foreigners arriving either in London or in Paris, without pressing recommendations or exalted rank, may be much embarrassed, and may in both places pass months and even years, without making one proper acquaintance. Yet it appears to me that there is this great and distinguishing difference between the manners of the two capitals, that a person properly introduced to a few families of fashion in London, will rapidly find his way into every society which he wishes to frequent; whereas, in Paris, however well individuals may be received in one or two of the most esteemed houses, that circumstance will not contribute to their introduction to any others; and if a stranger arrives with a certain number of recommendations, he may, after a six months residence, quit Paris without having increased the list of his acquaintance. I speak on this subject from experience. Besides a near relation of my own, two or three families long connected with mine, have still establishments here, and live in the best company of the place. By all these Mrs. — and myself were well and hospitably received, but the persons whom we met at their houses, neither paid us visits, or in other respects showed us the most trifling civilities."

The relative advantages and disadvantages of a residence in London and in Paris are fully detailed; the comparison seems to be fair and unprejudiced; for this reason it is with great pride and pleasure that we see the palm of pre-eminence bestowed on our own metropolis.

ART. XIX. *A View of Modern France; and British Traveller's Guide from London to Paris, &c.* By DAVID MORRICE. 8vo. pp. 360.

AS the use of this little volume has been wholly destroyed by the war, we copy from it the only facts of general interest,

"At the battle of Marengo, all the kettle drummers of a division of cavalry were killed, except one about fourteen years of age. This boy, without orders, beat a

charge, and the cavalry advanced. Enquiry was immediately made who had given the order, but no satisfactory account could be had. The cavalry however charged with success, and after the battle, Bonaparte ordered the drummer before him, and asked him, how he had dared, without order, to beat the charge. The boy quickly replied, "General, I saw a fine opportunity for the division to advance, and no orders were given; I could not resist the temptation, and, did beat the charge."—"My noble boy," replied the consul, "you gave a lesson to your general, and I will reward you for it." He immediately made him chief drummer of his favourite regiment of chasseurs, commanded by young Beauharnois, his stepson, and the boy always appears in a superb dress at the parade, with his drums and horse most beautifully adorned with silk and ribbons, gilt ornaments, &c.; and he never passes the first consul, in filing off, without a marked nod and a smile. He will no doubt soon be made an officer."

"It is said, that Mr. West exhibited, among his professional friends in Paris, a painting of the subject of "the pale rider on a white horse," mentioned in the Revelations, and is a most excellent likeness of the first consul. How far the application can be made in a serious point of view, is not for me to give an opinion upon; but much might certainly be said on the subject."

ART. XX. *Letters from France written by J. KING, in the Months of August, September, and October, 1802.* 8vo. pp. 168.

IF the declamations and interrogations of this author were all omitted, the "occurrences" announced in the title page might have been comprised in one letter of the ordinary length. The words and the matter of the volume are in the same proportion that the husk of a cocoa nut would be to the kernel of a filbert.

Mr. King has communicated one very interesting fact; he was introduced to Santerre, and conversed with him upon the execution of Louis XVI. Santerre entered on the subject without hesitation; he said it was expected there would be a cry for mercy, and a tumult in consequence, and he had received orders to fire on those who should begin it; the scaffold accordingly was surrounded by aristocrats, many of whom were well known men; the Marseillois were preparing to answer them and support the sentence, and a contest would in all probability have ensued, as bloody as the carnage at the Thuilleries, or the massacre at the prisons. The thought occurred to Santerre to bid the drums strike up;

We leave Mr. Morrice, Archbishop Cambaceres, and Mr. Bicheno to determine whether the first consul be the man on the white horse, or Gog and Magog; at the same time hinting, to their consideration, whether he may not possibly turn out to be the man in the moon.

The following anecdote is truly shocking:

"I asked a lady in Paris, who is under twenty years of age, and the mother of three children, what made her so indifferent to them, and unmoved by that adversity under which she was labouring; she replied, without hesitation, that she attributed it to the many scenes of horror she had witnessed in Paris, during the revolution, which had steeled her heart against the finer feelings, and rendered her proof against poverty, misery, and distress.—She added, that when a child, she was often promised, as a reward for good behaviour, to be permitted to go and see the victims of political fury guillotined, and has often witnessed the execution of seventy or eighty in the short space of an hour, the young and old scrambling for places, to see well, as if they had been at a play. She also observed, that to see two or three cart loads of dead and perfectly naked bodies, go by her window in the course of a morning, was very usual."

the watch word could not be heard, nor the cry raised, and thus the whole danger was prevented, and the lives of thousands were preserved.

Santerre added that

"Though the duty of seeing the king's sentence executed, devolved on him, it was impossible he could rejoice at an event, that however necessary was distressing and lamentable; he deplored it as much as any man in France, and tried all he could to prevent it by repeated visits to the Temple, to instruct the king by what measures he might still save himself; he said several expedients were proposed to the king, but his rejection of them evinced that he had no confidence in the nation and would retort upon it if ever he possessed power. Once he thought the king would accede to his overtures, but he required some hours to ponder on them; he saw the queen in the interim and declined further treaty. In the last extremity he made another effort, he went once more to the king, and told him his life was in danger if he temporized any more, but if he would listen to his overtures the king would be saved and liberated, he would forfeit his existence if he failed; again the queen interposed, and Santerre was set at defiance. Soon after

his doom was fixed and negotiation was unavailable."

Mr. Fox refused to visit Santerre. When we consider how that great and excellent man has been calumniated, we do not wonder at his refusal, yet we wish he had shown more courage in this instance, and more caution at the Thuilleries. The master-key of the Bastille is in Santerre's possession, he has likewise several species of fetters from the "king's castle," of which one pair had been found on the wrists of a man recently dead, who had been starved to death, either by design, or by a still more atrocious neglect.

The following anecdotes deserve selection :—

"Nothing marks the inconsistency of the French temper, more than this fact : on a day when several victims were immolating to the fury of Robespierre, a great concourse of people had assembled ; on that very spot, at the foot of that very scaffold where they suffered, a mountebank had reared his motley chair, and was exhibiting his monkey antics ; and while some were gazing at the strokes of the guillotine, others were laughing at the buffoon tricks of this unfeeling fool."

"What a soul had the wife of the Marechall de Monchy ; her husband being taken to the Luxembourg, she was there as quick as him ; she was told that the act of arrestation did not mention her ; "if my husband is arrested I too am arrested ;" he was carried to the revolutionary tribunal, and she accompanies him ; the public accuser tells her she was not sent for : "if my husband is sent for I shall be with him ;" he is condemned to death ; he is placed in the murderous car ; the executioner tells her she is not condemned : "if my husband, wretch, is condemned, I too am condemned." I come to the sequel ; must I so often depreciate the revolution ? these occurrences make us shudder, and induce us to believe that there are as many evils under a democracy, as under any other government. This unparalleled woman suffered with her husband ; she had committed no crime : she was testifying a conjugal love and heroism beyond example, and yet she was beheaded ; the executioner, the judge, and every monster accessory to her death, was guilty of a most atrocious murder."

"There was a trial in England respecting some forged assignats ; the person who forged them, confessed it in open court, and said it was done with the approbation of the secretary of state ; perhaps this was a falsehood, but it is on record, and no one from government has condescended to deny it. Lord Kenyon, the moral, simple, blunt, in-

dependent chief judge of that day, in summing up, told the jury, that in war there were certain laws by which nations were bound, such as not using poisoned arms, quarters in war, &c. &c. ; but forging assignats did not seem an offence against the faith of nations, &c. &c. About that time a projector presented himself to Robespierre, and shewed some curious plates for forging English bank-notes ; Robespierre rewarded his ingenuity with a commitment to the Conciergerie."

Bonaparte, it seems, wishes to efface all recollection of the fate of the royal family ; no one is permitted to see the dungeons of the Conciergerie where they were confined : a cowardly and vain precaution, as if the people could be made to forget their own power ! Mr. King was in Paris on the day when the usurper was chosen consul for life ; he heard some murmurs, and though, according to the continental custom, a fine was imposed on those who did not illuminate, he saw many a dark and gloomy window. Massena and Moreau, he says, have a distinct circle and no intercourse with any one out of it : if another change was to happen, it is from their integrity and moderation that the republic would expect to be freed from military servitude. They had a violent altercation with the first consul, and said to him, Sir, be more modest ! you have not much to presume upon : if each of us takes back the laurel of which you have robbed us, your brows will be naked ! This is a suspicious anecdote, and Mr. King discovers a strange want of discrimination or of knowledge when he classes Moreau and Massena together for their integrity and moderation. In military talent they are perhaps equal, and each has rendered more essential service to France than ever the Corsican performed : the campaign in Switzerland saved the republic, and it was in Germany that the emperor was finally disabled. But as Massena has the genius of an Italian adventurer, so also has he all the unprincipled rapacity of the character. There were but two generals in the French army in Italy who left behind them a fair name, Joubert, and Baraguay D'Hilliers : it is an act of justice to mention them ; their bills were regularly paid, and they were remembered with gratitude when Massena and Bonaparte were execrated.

Where Mr. King repeats what he has heard and relates what he has seen, in common courtesy we are disposed, and

in common justice bound, to believe that his relation is faithful. But his remarks are usually common-place and shallow, and in many instances so utterly without foundation that it is evident he can have taken little pains to examine, and little time to reflect. Every man, he says, travels safely in France; "either that the police is better regulated than in England, or there are national distinctions, and the French are not so dishonest as we are. Is it that our distresses are greater? Does liberty lead to licence? Is our education conducive to it? What makes this difference? All

Paris is a crowd, yet a pick-pocket is a phenomenon; burglaries are seldom committed, and we scarcely ever heard of a highwayman." P. 7. Yet at this very time it was not safe to travel in the provinces without an armed escort.

Again, we are told, "there is not yet that ostentation and luxury of the nobility which formerly insulted the misery of the people; there is no vain display of opulence." Could Mr. King be ignorant of the ostentation of opulence in the generals? of their unmanly luxury? of their Asiatic splendour as well as Asiatic vices?

ART. XXI. *The Stranger in France; or, a Tour from Devonshire to Paris; illustrated by Engravings in aqua tinta of Sketches, taken on the spot.* By JOHN CARR, Esq. 4to. pp. 261.

THIS is an amusing narrative; but during the short breathing time of peace, we had so many trips and tours in France, that if there were not a good deal of sameness in the accounts which have been published of them, we should be justified in suspecting the accuracy of the observer, or the fidelity of his description. Mr. Carr sailed from Southampton to Havre in a packet, which had on board a great number of emigrants, who, in consequence of the decree which had recently passed in their favour, were returning to their beloved *natale solum*. As the insolence and indelicacy of custom-house officers are proverbial, it is but justice to those who searched the baggage of these anxious exiles to record, that they "exercised a liberal gentleness, which gave but little trouble and no pain. They who brought nothing into a country but the recollection of their miseries," is the remark of Mr. Carr, "were not very likely to carry much out of it but the remembrance of its generosity." They were also received on their own shores without any violence or insult.

Mr. Carr makes the same observation concerning the celebrated bridge of boats at Rouen, which we noticed in our review of Mr. Hughes's *Tour* (see p. 81), that it is clumsy, heavy, inconvenient, and expensive: its repairs are estimated at about four hundred pounds a year. A handsome light stone structure; with a centre arch covered with a drawbridge for the passage of vessels of considerable burden, or a lofty flying iron bridge, would be less expensive, and Mr. Carr thinks, more safe and ornamental,

The French revolution afforded numberless examples of heroism and humanity in the female sex: the horrors of a dungeon before their eyes, and the fatal snap of the guillotine ever startling upon their ear were insufficient to subdue the courage which was inspired by affection. At Rouen, Mr. Carr dined at the table of Madame G—, and sat next an elderly abbé who seemed to be much esteemed by every person present.

"During the time of terrour (as the French emphatically call the gloomy reign of Robespierre) the blood of this good man, who, from his wealth, piety, and munificence, possessed considerable influence in Rouen, was sought after with keen pursuit. Madame G— was the saviour of his life, by concealing him, previous to her own imprisonment, for two years, in different cellars, under her house, which she rendered as warm and as comfortable as circumstances, and the nature of the concealment would allow. In one of these cells of humane secrecy, this worthy man has often eaten his solitary and agitated meal, whilst the soldiers of the tyrant, who were quartered upon his protectress, were carousing in the kitchen immediately above him."

Such instances as these are sunbeams in the storm, which cast a partial splendour and give hopes of a returning calm.

In the provinces, all criminal offences are tried before a tribunal composed of civil and military judges. Mr. Carr attended the trial of a notorious offender, and speaks highly of the arrangements of the court; it is one of the peculiar characteristics of these courts, that conviction is immediately followed by punishment. The trial of this unhappy

offender, whose fate was anticipated, had been postponed five months for the purpose of affording him an indulgent procrastination. At ten minutes after one, he was sentenced to lose his head at four o'clock in the afternoon! Mr. Carr summoned resolution to witness the execution: which we are sorry to learn appears to have passed almost unnoticed by the market-women, and who seemed only intent on the sale of their apples. In describing the dispatch with which the guillotine performs its office, Mr. Carr alludes to the fate of governor Wall, and concludes his chapter by relating an anecdote of the terror and infatuation of guilt, displayed in the conduct of this wretched man, in the presence of a friend of his, from whom he received it.

"A few years before governor Wall suffered, fatigued with life, and pursued by poverty, and the frightful remembrance of his offences, then almost forgotten by the world, he left the south of France for Calais, with an intention of passing over to England, to offer himself up to its laws, not without the cherished hope that a lapse of twenty years had swept away all evidence of his guilt.

"At the time of his arrival at this port town, the hotel in which Madame H—— was waiting for a packet to Dover was very crowded—the landlord requested of her, that she would be pleased to permit two gentlemen, who were going to England, to take some refreshment in her room; these persons proved to be the unfortunate Brooks, a king's messenger, charged with important dispatches to his court, and governor W——. The latter was dressed like a decayed gentleman, and bore about him all the indications of his extreme condition. They had not been seated at the table long, before the latter informed the former, with evident marks of perturbation, that his name was W——, that having been charged in England with offences, which, if true, subjected him to heavy punishment, he was anxious to place himself at the disposal of its laws, and requested of him, as he was an English messenger, that he would consider him as his prisoner, and take charge of him.

"The messenger, who was much surprised by the application, told him, that he could not upon such a representation take him into custody, unless he had an order from the duke of Portland's office to that effect, and that in order to obtain it, it would be proper for him to write his name, that it might be compared with his hand-writing in the office of the secretary at war, which he offered to carry over with him. Governor W—— still pressed him to take him into custody,

the messenger more strongly declined it, by informing him that he was the bearer of dispatches of great importance to his court, that he must immediately cross the channel, and should hazard a passage, although the weather looked lowering, in an open boat, as no packets had arrived, and that consequently it was altogether impossible to take him over, but again requested him to write his name, for the purpose already mentioned; the governor consented, pens and paper were brought, but the hand of the murderer shook so dreadfully, that he could not write it, and in an agony of mind, bordering upon frenzy, he rushed out of the room, and immediately left the town.

"The messenger entered the boat, and set sail; a storm quickly followed, the boat sunk in sight of the pier, and all on board but one of the watermen, perished!!!

"The great disposer of human destiny, in vindication of his eternal justice, rescued the life of this infatuated delinquent from the waves, and from a sudden death, to resign him to the public and merited doom of the laws."

In the course of the last war, we heard it frequently asserted, that no peace with the republic would be permanent, because it must be fatal to the consular interests: the return of the French armies would be attended with new insurrections; it would be impossible that so many soldiers should settle quietly to domestic labours, they would be clamorous for pay, and the increased consumption of provisions would create scarcity and confusion. Too true, indeed, it is, that the last peace was not permanent; but in order to correct so false an idea as this we have now noticed, it is worth mentioning that Mr. Carr, in the course of his walks and conversations with the workmen whom he met, found that most of the masons and gardeners of Rouen had fought in the memorable battle of Marengo, at which it appears that a great part of the military of France, within four or five hundred miles of the capital, were present. The change, he says, was worthy of observation; we saw men sun-browned in campaigns, and enured to all the ferocity of war, assuming at the sound of peace all the tranquil habits of ingenious industry, or rustic simplicity.

It may give some idea of the confidence of the present government of France in its own strength, that at the windows of the principal print-shops of Paris, Mr. Carr saw exposed to sale prints representing the late king in his full robes of state, under which was

written *Le Restaurateur de la Liberté*, and the parting interview between that unhappy sovereign and his queen and family in the Temple, upon the morning of his execution. It is very probable, as Mr. Carr conjectures, that the motto is intended as an equivocal, but at any rate the permission of a representation, which must excite so many monarchical prejudices, indicates great confidence on the part of government. Mr. Carr heard "Rule Britannia" played on a hand-organ in Paris: we heard the duke of York's march in the same metropolis about two years ago, and in one of the southern provinces our patriotism was excited by "God save the King" on a hand-organ.

Mr. Carr seems to have been exceedingly fortunate in his introductions, and though a *stranger in France* had every reason to feel himself perfectly at home. He goes to every public place of amusement, and of course sees all the museums, libraries, galleries, national buildings, &c. &c. which he describes agreeably, though sometimes in rather too high-flown language. His book is full of anecdotes, and if some of them bear no very striking internal evidence of truth, there are many interesting ones to which no suspicion can attach. The following is too honourable to the parties to be passed over, and adds another to the thousand instances of female fortitude and affection, which were displayed during the revolution. Mr. Carr had letters of introduction to Monsieur O——; he was at his country house about nine miles from Paris, an invalid. Heavy losses, a painful separation from his native country for the preservation of his own life and the lives of his family, had undermined his health and made sad inroads upon a delicate constitution. It was in the afternoon of one of the finest days in June that Mr. Carr accompanied the lady of this gentleman in her carriage to the chateau. After an elegant supper, when Madame O—— and her daughter had withdrawn, Monsieur O—— entered into a very interesting account of his country, of the revolution, and of his flight.

"He spoke of his lady with all the tender eulogium of a young lover. Their union was entirely from attachment, and had been resisted on the part of Madame O——, when he first addressed her, only because her fortune was humble, compared with his. He informed me, and I must not suppress

the story, that in the time of blood, this amiable woman, who is remarkable for the delicacy of her mind, and for the beauty and majesty of her person, displayed a degree of coolness and courage, which, in the field of battle, would have covered the hero with laurels. One evening, a short period before the family left France, a party of these murderers, who were sent for by Robespierre, from the frontiers which divide France from Italy, and who were by that archfiend employed in all the butcheries, and massacres of Paris, entered the peaceful village of la Reine, in search of Monsieur O——. His lady saw them advancing, and anticipating their errand, had just time to give her husband intelligence of their approach, who left his chateau by a back door, and secreted himself in the house of a neighbour. Madame O——, with perfect composure, went out to meet them, and received them in the most gracious manner. They sternly demanded Monsieur O——; she informed them that he had left the country, and after engaging them in conversation, she conducted them into her drawing room, and regaled them with her best wines, and made her servants attend upon them with unusual deference and ceremony. Their appearance was altogether horrible; they wore leather aprons, which were sprinkled all over with blood, they had large horse pistols in their belts, and a dirk and sabre by their sides. Their looks were full of ferocity, and they spoke a harsh dissonant patois language. Over their cups they talked about the bloody business of that day's occupation, in the course of which they drew out their dirks, and wiped from their handles, clots of blood and hair. Madame O—— sat with them, undismayed by their frightful deportment. After drinking several bottles of Champaign and Burgundy, these savages began to grow good humoured, and seemed to be completely fascinated by the amiable and unembarrassed, and hospitable behaviour of their fair landlady. After carousing till midnight, they pressed her to retire, observing that they had been received so handsomely that they were convinced Monsieur O—— had been misrepresented, and was no enemy to the good cause; they added that they found the wines excellent, and after drinking two or three bottles more, they would leave the house, without causing her any reason to regret their admission.

"Madame O——, with all the appearance of perfect tranquillity and confidence in their promises, wished her unwelcome visitors a good night, and after visiting her children in their rooms, she threw herself upon her bed, with a loaded pistol in each hand, and overwhelmed with suppressed agony and agitation, she soundly slept till she was called by her servants, two hours after these wretches had left the house."

Mr. Carr's is certainly altogether a very amusing book; the attentions

which he received may excuse him for having drawn a more flattering portrait of the people of France, than is usually pencilled by Englishmen who have not been so fortunate as to the society

into which they were thrown. The volume is ornamented with a variety of views taken by Mr. Carr on the spot: they do credit to his taste, and doubtless to his accuracy.

ART. XXII. *Paris as it was and as it is; or a Sketch of the French Capital; illustrative of the Effects of the Revolution, with respect to Sciences, Literature, Arts, Religion, Education, Manners, and Amusements; comprising also a correct Account of the most remarkable National Establishments and Public Buildings. In a Series of Letters, written by an ENGLISH TRAVELLER during the Years 1801-2, to a Friend in London. 8vo. 2 vols. pp. 1040.*

THIS will be a very useful as well as entertaining companion to the Englishman at Paris, should a speedy peace allow him to visit the capital. The author has given a more ample and minute account of the various places of amusement, public buildings, galleries, scientific and learned institutions, &c. than any of the numerous travellers whose descriptions have come before us. His account is interspersed with a variety of historical anecdotes, illustrative of the French character and manners, and his attention is very properly employed in estimating the utility and intrinsic importance of those military, naval, and civil institutions which have been so multiplied since the era of the revolution. We are the French in their fashions and their fooleries; it would be more becoming if, impressed with the just sense of the advantages they are likely to derive from their various schools for public services, we were to rival them in similar establishments. The author of these pages is desirous of calling the attention of the British government to this subject, and by way of stimulating the ambition of British genius, he assures us that the arts and sciences in France are now making a rapid and simultaneous progress; first, says he, because the revolution has made them popular in that country; and secondly, because they are connected by new ties which in a great measure render them inseparable. Facts are then recurred to, less with a view to draw from them immediate applications, than to develop the truths resulting from them. "With them, method is an induction incessantly verified by experiment; whence it gives to human intelligence, not wings which lead it astray, but reins which guide it."

In a letter on the state of French literature, we find some ingenious remarks and shrewd distinctions. Under the

constituent assembly the literary genius of the French was turned towards politics and eloquence; under the legislative assembly, literature was constantly cultivated under several forms, although the literati themselves became victims of the political convulsions of their country. The national institute was established under the directorial government. It was at one time insinuated in many periodical publications of this country, that literature had been totally annihilated in France during the course of the revolution. This is a mistake; and our author seems justified in stating that "its aberrations have been taken for eclipses;" it has followed the revolution, says he, through all its phases. The *literati*, he observes, are now considered as men of secondary importance, the *savans* taking the lead; to these latter, who have revived the drooping arts and sciences, France is under the greatest obligations. The utility of the objects to which genius and labour are devoted, give them a fair title to preference; the consequence has been, that while the French government has flattered men of letters, its solid distinctions and honours are reserved to men of science. Science and literature, however, must ever go hand in hand; and we are not at all surprised at the result of our author's observation, namely, on the one hand, that few men of science are unacquainted with the literature of their country; and on the other, that very few literati are unacquainted with philosophy and the sciences, and above all with natural knowledge. The general inference then is, that "French literature has not received any apparent injury from the revolutionary storm: it has only changed its direction and means: it has still remaining talents which have served their time, talents in their maturity, and talents in a state of probation, and of much promise."

ART. XXIII. *The Praise of Paris : or a Sketch of the French Capital ; in Extracts of Letters from France in the Summer of 1802 ; with an Index of many of the Convents, Churches, and Palaces, not in the French Catalogues, which have furnished Pictures for the Louvre Gallery. By S. W. F. R. S. F. A. S.* 8vo. pp. 186.

"THE Praise of Paris"! Surely this is not the language of impartiality ; but all things must be estimated by comparison, and in order to justify his eulogy, Mr. Weston could not do better than compare Paris with itself. "In the year 1792," says he, "I ran from Paris with fear and trembling, because she was possessed, like a demoniac, with a spirit of carnage, and reeked in the blood of August and September. During the interim between 1792 and 1802, when I revisited her again, she had continued in a state of siege for ten years, beset with troubles from without and violent agitations from within, and perpetual spoil. But all things have an end ; and now on my return to the same place, before so full of confusion and disorder, I find it swept and garnished, restored to its senses, and in its right mind : this extraordinary change calls aloud for commendation, and is a sufficient apology for my title *The Praise of Paris*."

We could have wished Mr. Weston to have "extracted" more fully from his letters ; not that there is any dearth of information on the ordinary topics of enquiry, what is the colour of the consular livery ? how many theatres are there ? who dances best, Vestris or Didelot ? Our tourists have not neglected to give an ample list of libraries and museums, but Mr. Weston has probably examined them with an antiquarian eye, and could easily have enlarged his too scanty list of curiosities ; without much expence of labour to himself he could have set before us a much more ample and diversified repast ; he has given us a *bonne bouche*, but it is rather calculated to excite than satisfy the appetite.

In the medal room of the national library is a gold dish found at Rennes in 1774, of the year 960 of Rome, and 208 of Christ ; it was found in repairing a house belonging to the chapter, six feet two inches below the surface, with a clasp, a chain four feet one inch in length, four coins of Posthumus encircled with a fillagree, and furnished with a ring to hang them about the neck, and ninety-three imperials, of which thirty-four the flower of the die, are placed in the series of the emperors.—The whole weighed together seventy ounces. Round the dish are sixteen imperial heads, let into the border with wreaths of parsley leaves or laurel encir-

cling each. The coins begin at Hadrian, and end at Julia Domna. This border surrounds two bass reliefs, one of which, the largest, forms the centre piece : the rapid description which Mr. Weston gives of this "inestimable treasure of antiquity," makes us anxious to see the promised plate and dissertation of Citizen Millin. Has it yet made its appearance ?

We transcribe the following letter, as it affords a specimen of Mr. Weston's critical acumen :—

"A sepulchral urn, with a Greek inscription on it, has been found at Marseilles, in a part of the ancient Abbey of Saint Victor, which was demolished in the revolution, in order to erect on its site a soap manufactory. About eight feet below the cellars many urns were found, one in particular, with a Greek inscription upon it, which has been published by Monsieur Fauris Saint Vincent, in Citizen Millin's *Magazin Encyclopedique*, for the year V. of the French Republic ; having been first revised by the very learned D'Ansse de Villoisson, who has corrected it all through, except in the last line : he is of opinion that it is of an age later than Augustus, from the form of the letters, or, perhaps he might say, than Severus. The monument was in an horizontal position when found, though originally intended to be set upright. It is made of a common, though very hard stone ; its length is five feet ; and its breadth nineteen inches below, and seventeen above the inscription, which is engraved long ways on the stone. Fauris St. Vincent is of opinion, that this monument served first for the person in the inscription ; and in process of time was used for some other person ; and had had its position changed from upright to horizontal. The urn is without a cover, though it appears that it once had one, and, perhaps, a small statue on it in its erect state ; some few bones were found in it. The inscription is thus engraved on the monument :

ΓΛΑΥΚΙΑ ΕΣΤΙ ΤΑΦΟ  
ΠΑΙΣ ΔΑΝΕΘΗΚΕ ΝΕΟΣ  
ΔΕΙΖΑΣ ΕΚ ΜΕΙΚΡΟΥ ΠΡΟΣΠΑ  
ΤΕΡ ΕΤΣΕΒΙΗΝ ΟΥΚ ΕΦΘΗΣ  
Ω ΤΑΗΜΟΝ ΙΔΕΙΝ ΓΟΝΟΝ ΟΙΟΣ  
ΑΝ ΗΝ ΣΟΙ ΓΗΡΑΙΩ ΤΕΥΧΕΙΝ  
ΟΥ ΤΑΦΟΝ ΑΛΛΑ ΒΙΟΝ Η ΦΘ  
ΝΕΡΑ ΔΥΜΑΣ ΠΑΝΤ ΑΔΙΚΟΥ  
ΣΑ ΤΥΧΗ ΜΗΤΡΙ ΜΕΝ ΕΝ ΕΝ  
ΓΗΡΑ ΔΑΚΡΥ ΘΗΧΑΤΟ ΤΗΔΕ  
ΓΥΝΑΙΚΙ ΧΗΡΙΑΝ ΔΥΣΤΗΝΟΥ  
ΠΑΙΔΟΣ ΑΜ ΟΡΦΑΝΗ

"This is the form of the inscription, as published by the French; and it consists of two hexameters and five pentameters. Monsieur Villoison has filled up the lacunæ, and corrected the slips of the graver; and presented it in the following form:

Γλαυκία ἐστὶ τάφος, παῖς δ' ἀνέθηκε νέος.

Δείξας ἐκ μικροῦ πρὸς πᾶτερ' εὐσεΐην.  
Οὐκ ἔφθης ὦ τλήμων ἰδεῖν γόνου οἰος ἂν ἦν  
σοὶ :

Γηραῖω τεύχειν οὐ τάφου, ἀλλὰ εἶον.

Ἡ φθονερά δ' ὕμῃς πάντ' ἀδικούσα τύχῃ.

Μητρὶ μὲν ἐν γήρα δάκρυ θήκατο, τῇδε  
γυγαίῃ

Χηρίαν δυστήνου παιδὸς ἄμ' ὀρφανίῃ.

"In English:

"This is the tomb of Glaucias, that a youth has consecrated to his father, as a testimony of his filial affection, of which he has given proofs from his infancy. It was not thy lot, O wretched Glaucias! to live long enough to see what thy son was able to do for thee; not in providing thee with a monument, but in procuring thee means of living in thy old age. To thee, and thine, Fortune has been uniformly unjust; to thy aged mother she has given tears; to thy wife widowhood, with a wretched orphan-son!

"In order to correct the measure of the seventh verse, Monsieur Villoison writes Χήρᾃ, which by no means expresses the sense required of widowhood, as he seems ready to confess. What is then to be done? Χηρίαν may be Ionice for Χηρείαν, as, it is well known, προμηθίῃ and συμπαθίῃ are for προμηθείᾳ and συμπάθειᾳ, in Herodotus and Aretæus, and εὐσεΐῃ in the inscription itself; and then it may also be short, like the adjectives in ἰον: quorum penultima corripitur Ionicè, et Dorice, of which Dr. Burney has collected all the instances in his review of Mr. Professor Porson and Wakefield, τοῦ μακροῦ; but the next word is unmanageable as it stands, and must be corrected; I read, instead of ΔΥΣΤΗΝΟΥ ΑἶΣΤΗΝΟΥ which means the same thing, and the sense is preserved, and the metre restored. Ἀσπίνος

in Hesychius is explained δὲ ἄσπινον· χαλεπὸν. See also the Etymologicon magnum, where ἄσπινος is a poor wretch who has no place to set his foot. This agrees very well with an orphan. It is not improbable that Δ should be engraved for Α, since μεικρὸν has been written for μικρὸν, θηχάλο for θήκαλο, and δείξας for δείξας; and it is highly so, that the author should have thought χηρίαν could be made a dissyllable. The correction here proposed is effected by leaving out one letter; in the sixth line there are two too many, EN."

Prefixed to this little volume is an image of Isis, with the following account of its preservation:

"Paris is derived from Par Isis, because it was built near the famous temple of that goddess, not far from the scite of the abbey of Saint Germain des Prés. At the establishment of christianity the temple was destroyed, but the idol remained till the beginning of the sixth century, when it was thrown as a trophy into a corner of the church of Saint Germain des Prés, founded by Childebert with the title of The Holy Cross, and Saint Vincent. This same trophy existed in the time of Cardinal Briçonnet, Abbé of Saint Germain, in the latter end of the fifteenth century, who ordered it to be broke to pieces, which order was probably never executed, as the image of Isis nursing Orus is now at the Petits Augustins, and was brought thither, with other monuments, out of a French church. Λευκετῖα, now called Lutetia, is derived from Λευκότης, whiteness, from the white plaister quarry on which Paris is built. From Λευκότης came Lucotesia, and, finally, Lutetia, the second syllable having been dropped for shortness, as in regatta for remigatta, and Saint Meric for Saint Mederic."

Mr. Weston is not inattentive to the state of manners and amusements among the Parisians, and the reason we have said nothing about his account of them is, that we have found something else to interest us: we find the description, too, more ample in many other volumes, where there is little else to delay us.

ART. XXIV. *Letters of a Mameluke: or a moral and critical Picture of the Manners of Paris. - With Notes by the Translator. From the French of JOSEPH LAVALLEE, of the Philotechnic Society, &c.* 2 Vols. 12mo. pp. 576.

THESE letters are written in the manner of Miss Hamilton's letters of a Hindoo Rajah, but the character of the Mameluke is not so well supported as that of the Rajah: nothing can exceed the absurdity of putting such remarks and reflections as are interspersed through these pages, into the mouth of a Mameluke. The author seems aware of this,

and yet suffers the absurdity to remain rather than take the trouble of correcting it. For a Mameluke to criticise the works and opinions of the old French philosophers; to send to his friend Giafar, a native and inhabitant of Egypt, remarks on the dramatic merits of Racine, Corneille, &c.; to give him an historical account of the factions which have reign-

ed in France for two or three centuries ; and to talk as familiarly about the heroes of Greece and Rome as he would of his own Beys and Pachas ; what can be half so absurd ?

But if the picture of French manners is a good one, it signifies little whether the artist is a Mameluke or a Frenchman : the worst of it is, that when a man sits down to draw his own portrait, he may take a likeness, but it will most probably be a flattering one. That is a good deal the case here : the French are allowed to have a great many foibles and fopperies, but the more our Mameluke becomes acquainted with them, the more impressed he is with the goodness of their hearts, the variety and transcendency of their virtues. Let us speak of these, says he in one of his early letters : the French have one that is not sufficiently remarked, nor is it esteemed according to its value ; it is that in general they never do mischief with reflection. To understand me, observe that it seldom happens that the man inclined to do mischief with a premeditated intention, repairs it. The French are not wicked ; they are only mischievous.

Philosophers have long and idly puzzled themselves about the causes of the French revolution : some attribute that event to the derangement of the finances, others to the oppression of an insolent nobility ; some to the disorganization of the military, others to the introduction of commerce ; some seek it in an individual cause, others in the co-operation of many. What philosophers, moralists, and politicians, however, have sought for without satisfaction or success, is at last discovered by an emigrant from the banks of the Nile ! “ In this country,” says he to his friend Giafar, “ the native inhabitants were called *Gauls* : their origin is of the most remote antiquity. Who knows it ? no one. It is fifteen centuries since a conquering people came and incorporated themselves with them : they called themselves *Franks*. They possessed the same bravery, but not the same manners. It is imagined that they have been mixed, that every shade of distinction has disappeared. This is not the case : like two rivers, they have flowed in the same bed without mixing. During twelve years which they have just employed in their modern revolution, a thousand events appear to them an enigma. They are blind : let them look, the solution is there : the *Franks* always rough,

always untamed, always licentious : the *Gauls* always frivolous, always inconstant, always superstitious ; and *both always terrible in war*. There lies the whole mystery.”

“ For fifteen hundred years, two nations very distinct, inhabit the territory of France ; a nation of victors, and a nation of vanquished ; there is the grand cause ; a complete mixture has never been effected : the present epoch is the first moment when it is beginning to take place.” Our Mameluke traces the relative situation of these two nations, through the several dynasties of France ; the Gauls have always continued to be the *people*, and the Franks their masters. “ From the time of Clovis to the end of the eighteenth century, what was constantly the favourite expression of the monarchs, of the great, of the nobles, &c. ? *Our brave ancestors the Franks* ; and what is very worthy of remark is, that never, no never, was it employed by the people.” Our Mameluke admits, indeed, that for some centuries this species of formula was used more from habit than from sentiment ; and like a true systematist, exclaims, “ but what signifies that ? it is the true vestige : *our ancestors the Franks !*” So that the first grand cause of the revolution was a determination on the part of the aboriginal Gauls, the people, to drive away from their territory the lineal descendants, pure and uncontaminated no doubt, of those Franks who had invaded it 1500 years before, and had kept in their hands the offices, the honours, and emoluments of state ever since !!!

Although, as we have already observed, the author of these letters has given his countrymen credit for all that is generous, brave, ingenious, &c. he satirizes with sufficient severity those follies and vices which he discerns, or rather which he acknowledges, in their character ; he reprobates very properly their singular propensity for duelling, which we regret to learn is daily increasing throughout the republic, and which our author thinks has taken so deep a root, that it can never be extirpated. “ The ordinance the most certain against duelling,” says he, “ would be an ordinance which should prohibit Frenchmen from exercising their wit. They fight, say they, to avenge their offended honour ; this is a mere pretext ; out of a hundred duels, ninety-nine have no other cause than a witty sally or a

repartee. The sally makes the auditors laugh; and if the repartee is gay, lively, and strikingly pointed, all of a sudden the laughers change sides. Here then is a victory lost at the very moment when one party was beginning to enjoy it! It is very well known that the rage for duelling was attended with very serious evils in the army, not among the officers merely, but the privates, who are said to have gone out in bodies consisting of a brigade perhaps, and settled some affair of honour! Many of our readers will recollect the account in the Paris papers, (Nov. 3, 1803,) of two soldiers of the Parisian guard, who fenced with sabres, naked to the waist, in the *Champs Elysées*. Women of the first fashion and elegance attended the spectacle! fortunately for one of the com-

batants, whose blood began to flow, an officer interfered by his authority and saved his life. The translator of these letters says, that within this last year, even ladies have begun to fight with pistols: in May 1802, a Madame Deunaigly fought and wounded with a pistol a Madame de Tourville, whom she accused of having seduced her lover!

On the whole, though by no means disposed to think highly of the execution of this work, it would be injustice not to say that there are several little traits of French character delineated, which, perhaps, scarcely any one but a Frenchman would have touched upon.

The translation is wretchedly executed, abounding both with Gallicisms and blunders.

ART. XXII. *Travels from Moscow, through Prussia, Germany, Switzerland, France, and England.* By NICOLAI KARAMSIN. Translated from the German. 3 vols. 12mo.

OUR readers will naturally be curious to know the remarks of a Russian traveller, even in his tour through Germany, Switzerland, and France; but will survey, with peculiar interest, his observations on our own dear native country. We shall therefore devote a larger space to M. Karamsin on this account, than perhaps we should be induced to do from the sole merit of his publication.

We learn, from the work before us, that M. Karamsin is a young Russian nobleman, well versed in German literature, and deeply enamoured of Sterne, and some other English authors of the same stamp. Neither science, nor natural history, nor politics, nor statistical details, appear to be the objects of his attention: he travels not like the illustrious Peter, to bring back to his country the arts and the sciences, but to satisfy at least a harmless curiosity, concerning the manners and social habits of the principal nations of Europe, and a desire of seeing and conversing with those literary men, from the perusal of whose works he had derived the greatest pleasure. The study, however, of men and national characters is attended with peculiar difficulty: it requires long residence, habits of great intimacy, a perfect command of the language of a country, quick discrimination, and a habit of seizing minute circumstances as they arise; in short, such a combination of natural talents and fortunate opportunities, as are very rarely found to unite in one person. But though

M. Karamsin ranks not in the same class with the late Dr. Moore, he appears to have been by no means negligent of the occasions afforded him of collecting interesting anecdotes, or describing his interviews and conversation with the literary characters of Germany and Switzerland; and if, in the other parts of his travels, he is guilty of egregious misrepresentation, it appears to be rather attributable to ignorance than an intention to deceive.

M. Karamsin, on leaving Moscow, took the road to Petersburg, whence he proceeded through Courland, and the Prussian part of Poland, to Berlin. At Königsberg, he had an interview with the celebrated Kant, who appears to be an amiable old man, of simple manners and liberal sentiments. Too many pages are devoted to conversations with innkeepers and his fellow-travellers in the stage-coach: an innkeeper is the same animal all the world over, and ignorance and brutality are not peculiar to Prussian officers.

From Berlin, M. Karamsin, passing through Leipzig, Weimar, and Mannheim, arrived at Strasburgh. "When we reached the French boundary the postillion stopped." A fellow of a filthy appearance, approaching the coach, addressed us, '*Vous êtes déjà en France, Messieurs, et je vous en félicite.*' It was the custom-house officer, who expected a few sous for this gratification."

At Weimar, our traveller relates his visits to Herder and Wieland. To the

former, the golden key of flattery gave him an easy admission, but the latter was by no means so readily accessible : his cold forbidding manner had well nigh repulsed the adventurous Russian ; perseverance and compliments were, however, at length victorious, and the first ceremonious interview was succeeded by a social evening, in which they parted mutually satisfied with each other.

" Never, never," says M. Karamsin, " shall I forget him. You should have seen, my friends ! with what frankness and energy he speaks, though nearly sixty years old ; what animation pervades every feature of his countenance in conversation ! His mind has not yet begun to grow old, and his powers are unimpaired. The same richness and playfulness of poetic genius which distinguish his *Oberon*, *Musarion*, and other works, is found in his last production, *Clelia* and *Sinibald*. It appears even, that the last fruits of his muse approach nearer and nearer to perfection. He has been known in Germany as an author for upwards of thirty-five years. His earliest essays attracted public attention. The severity of criticism, which then began to prevail in Germany, certainly found many faults in these first flights of his youthful genius ; though it could not deny the author the merit of a peculiar art of representation, a fertile imagination, and exquisite sensibility. But the period of his fame properly commenced with the publication of his *Comic Tales*, which are inimitable in their kind ; and were in Germany considered as unique. The reader cannot but admire the wit, taste, and beauty of the language, and the skill in narration which prevail in these pieces. Poems after poems by him have since appeared ; the last of which always appeared the best. Germany has long acknowledged him one of her first-rate poets. He now reposes beneath his laurels, but he does not slumber. The French have renounced their former contemptible opinion of German literature, which was not without foundation, at a time when the Germans occupied themselves with the departments of dry literature. If the principal and most impartial of the French literati now confess, that the Germans have not only overtaken them in many things, but even surpassed them in many others, it must be confessed, that Wieland's works have partly contributed to produce this effect ; though they are not remarkably well translated into the French language."

M. Karamsin entered Switzerland at Basle, and on his way thither from Strasburgh, made an acquaintance with a young Dane, who is the hero in many of the incidents afterwards recorded in our traveller's journal.

" He is the son of Mr. Becker, of Copenhagen, apothecary to his Danish Majesty, and has studied medicine in Germany ; but chiefly devoted himself to chemistry, under the instruction of Klaproth at Berlin. After this he traversed almost all Germany on foot, with his dog and his hanger, sending his trunk before him by the coach. He is now going to see what is remarkable in Switzerland, and then intends to visit France and England. He loves his dog with the tenderest affection. On the road he kept looking out behind, every now and then, to see whether he was following the coach ; and as he observed, a few miles from Basle, that the animal was fatigued, and began to lag behind, he wished us a good journey, and got out of the coach, that he might follow slowly after with his faithful companion."

At Zurich, M. Karamsin visited Lavater, with whom it appears that he had been before engaged in a correspondence, and whom he seems to reverence as the wisest of mortals. His first reception, though cordial, was not so tenderly sentimental as the inexperienced enthusiasm of our traveller expected. He obtained, however, by this acquaintance, an introduction to most of the Swiss literati, and in the next interview with Lavater, found himself quite at ease, and upon terms of intimacy. Numerous anecdotes and little traits of character, are related concerning this celebrated man, which show in a striking manner his great benevolence and great vanity ; and the result of the whole on the mind of the reader, will be esteem for the one, and indulgence for the other.

" Every day augments my admiration of Lavater ; he has not an hour's leisure and the door of his closet is never shut. Hither throng beggars asking charity,—the afflicted who seek consolation,-----travellers who, though they want neither, at least contribute to occupy his time. Besides, he visits the sick not only of his own parish, but likewise of many others. This evening, after writing several letters, he took his hat, and requested me to accompany him. I should like to see where he is going to, thought I, and followed him. We went out of one street into another, and at length through the gate of the town. We arrived at a small village and entered a cottage. " Is Anna yet alive ?" demanded Lavater of an old woman who came to meet us. " She scarcely breathes," replied she, with a flood of tears ; and opened the door of a chamber ; where I beheld, in a bed, an aged and emaciated woman, whose wan and livid countenance bespoke the near approach of death. Two boys and two girls stood round the bed and wept. The

moment they saw Lavater, they ran and kissed his hands. He approached the patient, and asked her how she did. "I am dying! I am dying!" she replied, but was unable to say more. Her eyes were fixed on her bosom, which heaved with inward convulsion. Lavater sat down beside her, and began to prepare her for her departure. "Thy hour is come;" said he, "thy Saviour awaits thee. Be not thou afraid of the grave! Not thou, but only thy mortal body, will be deposited in it. In the moment when thy eyes are closed to the light of this life, the glorious morning of an eternal and better life will shine upon thee. Be thankful to God that thou hast attained a good old age, and hast seen thy children and grand children grow up, matured in honesty and virtue. They will for ever bless thy memory, and will once embrace thee with raptures in the mansion of the blessed. There, there, we shall all form but one happy family." These last words he uttered in a tremulous voice, and wiped his eyes. He then prayed, blessed the dying sinner preparatory to her exit, and took his leave. He kissed the children, told them not to weep, and at his departure gave them some money."

"On Saturday evening Lavater shuts himself in his closet, to consider of his sermon, and which he completes in an hour. In fact it cannot be a difficult task, if all his sermons are like that which I heard to-day. "The Saviour has taken all our sins upon himself; for which he is entitled to our warmest gratitude." These thoughts, which he enlarged upon and embellished, comprised the whole substance of his discourse, exclamations, and declamation!—nothing more! I must confess I expected something of a superior kind."

By a ludicrous mistake, the Zurich volunteers obtained a compliment from M. Karamsin, which all the praises that British volunteers have received, and may hereafter receive, can never equal.

"I went with Mr. T. to see the Zurich militia exercised. Almost all the inhabitants of Zurich were present, for it is to them an uncommon spectacle. A circumstance occurred here rather grating to my feelings: Professor Breiting, whom I had not yet seen since my return from Schaffhausen, met me amidst the crowd, just as the manœuvres were finished; and, after the usual compliments, asked me how I liked what I had seen? Conceiving that he alluded to the Fall of the Rhine, my imagination instantly recalled that scene, in all its magnificence; the earth trembled beneath me; the roaring was tremendous; and I replied with ecstasy and enthusiasm, "Oh! who can ever find words to describe this magnificent spectacle! we can only gaze in silent astonishment!" "They were our volunteers," replied he with a bow, and left me."

At Murten is the charnel-house, where are kept the bones of the banditti, who were led on by the duke of Burgundy, in 1476, to desolate Switzerland, and extinguish its liberties. They were attacked on the shore of the lake of Murten, by the united and valiant mountaineers, and of the whole host of 30,000 men, the leader alone escaped the fate which they deserved. Upon this honourable trophy M. Karamsin makes the following observations, which we can indeed excuse in the sentimental slave of an autocrat, though we are unable to read them with patience.

"I started at the melancholy sight of these proofs of our perishable nature. And, ye Swiss, can ye exult over these lamentable trophies? Were not the Burgundians, as men, your brethren? Had you bathed with your tears the remains of these thirty thousand unfortunate fellow-creatures, and committed them to the earth, accompanied by your benediction; had you erected in the field of triumph a sable monument, with this inscription—*Here the Swiss fought for their country. They conquered, but tears mingle with their songs of triumph!*—then should I have bestowed the tribute of unreserved praise! Hide this monument of barbarism; and, if ye pride yourselves in the name of Swiss, forget not that you have the still nobler appellation of men."

It is not in human nature that a free people should feel regret for the destruction of foreigners, whose sole objects in the invasion of their territory, are rapine and subjugation. The tears that mingle with the songs of triumph for liberty secured, are tears of unalloyed rapture: in that heavenly moment, when the father glories in his fallen son, when wounds are badges of honour, when all private feelings are absorbed in the public welfare, when each individual ceases to be a man and feels only that he is a Greek, a Swiss, a Briton! how can the prostrate Persian or Burgundian be considered as any thing but a slaughtered wolf?

Among other celebrated characters in Switzerland, whom our traveller had an opportunity of visiting, was the excellent Bonnet, an old man, but "whose eyes still sparkled with fire, whose voice was still sound and harmonious; in a word, Bonnet, from whom a second *Palingenesie* might be expected." Our limits will not allow us to quote the interesting particulars which M. Karamsin relates concerning this good man; we cannot, however, avoid mentioning

a curious anecdote that is inserted here concerning Lavater. He and his son were visiting Bonnet, when Lavater started up on a sudden, tore off the wig from Bonnet's head, and said to his son, "Look, Henry! wherever you can behold such a head, there learn wisdom!"

The route of M. Karamsin from Geneva, by Paris, to Dover, presents us with nothing new. Paris has been often described more minutely, and with greater accuracy. Our traveller does not appear to have been introduced to any celebrated character in France except the Abbé Barthelemi, and the only memorials of the interview are a few mutual compliments.

In England his only associates were the members of the Russian embassy; he seems not to have been acquainted with a single family, or a single individual, either of rank or talents; and if to this is to be added his ignorance of the language, we may readily excuse his misrepresentations.

The following sketches of London are among the most interesting and the least erroneous of this part of his book:

"I sent for a barber, and they brought me a thick phlegmatic Englishman, who, having first unmercifully flayed my face, plaistered my head with flour and tallow. "Alas, I am no longer in Paris," I said to myself, with a sigh, "where the powder-puff of the ingenious lively Ruellet played like a gentle zephyr around my head, and strewn it with a resplendent-white aromatic rime." To my complaints that he was flaying me, that his pomatum stunk, and that his hair-powder was only coarse flour, the unpolished English barber sullenly answered, "I don't understand you, Sir!"

"I put on my Parisian frock, bethought me of dear France with a sigh, and walked out in a very melancholy mood. But the cloud that darkened my soul soon vanished at the sight of the beautiful illumination, which presented itself to my wondering eyes.-- Though the sun was scarcely set, all the lamps in the streets were lighted up. There are thousands of them, and which ever way I turn I behold a fiery string, as it were, extended through the air; I had never before seen any thing similar to it, and I no longer wondered at the mistake of a German Prince, who on making his entry into London, imagined that it was an illumination provided on purpose to welcome him with

peculiar marks of honour. The English are fond of light, and they spend millions to supply, by artificial, the want of the solar rays—an indubitable proof of the national wealth."

"Whoever calls London noisy must either never have seen it, or must have no correct idea of what a noisy city is. London is populous it is true; but, compared with Paris, and even with Moscow, it is extraordinarily quiet. The inhabitants of London seem to be either half asleep, or overcome with lassitude from their excessive activity and exertion. If the rattling of the carriages did not, from time to time, shake the auditory nerve, a stranger might frequently suppose he had become deaf, while passing along some of the most populous and most frequented streets. I stepped into several coffee-houses, where I found from twenty to thirty persons reading the newspapers, and drinking their port; while the profoundest silence reigned in the room, except that perhaps every quarter of an hour, one hears a solitary "*Your health, Gentlemen!*" Can it then excite wonder, that the English are such deep thinkers, and that their parliamentary orators know not when to leave off, when once they have begun to speak: it would seem as if they were tired of, and willing to make amends for their usual taciturnity.

"But if my ears thus enjoy rest and quiet, my eyes are the more busily engaged. In London, too, the women are very handsome, and they dress with tasteful simplicity; they are all without either powder or paint, and wear hats, which seem to have been invented by the Graces themselves; they seem rather to fly than to walk; their neat little feet, which peep out from under their snow-white muslin robe, scarcely touch the pavement. Over their white corset an Indian shawl is spread, on which their fair hair descends in charming ringlets: for to me, at least, it seems that the greater part of the English women have fair hair: the most beautiful of them, however, are brunettes. The physiognomies of the men may be arranged under three classes; they are either surly, good-natured, or brutish. I can safely swear, that in no other country have I seen so many brutish faces as here; and I am now convinced that Hogarth drew from nature.—Such physiognomies are, it is true, only to be met with among the populace; but then there is so much variety, so much characteristic expression in them, that ten Lavaters would scarcely be able to point out the bad qualities and propensities which they indicate."

ART. XXIII. *Travels through the Southern Provinces of the Russian Empire, in the Years 1793 and 1794. Translated from the German of P. S. PALLAS. Vol. II. 4to. pp. 537. 41 Plates, Vignettes, and Maps.*

THE present volume is occupied by Professor Pallas's tours in the Crimea and the island of Taman, and his general observations on the inhabitants and productions of this interesting country.

The northern half of the Crimea is flat, and but little worthy of notice; accordingly the whole of the five journeys here recorded, were occupied in exploring the interior, the southern coast, the peninsula of Kertsh, and the opposite isle of Taman, between which the Cimmerian Bosphorus affords a passage from the sea of Azof to the Euxine.

The professor entered the Crimea in the month of October, by the Isthmus of Perekop, a flat neck of land about eight versts and a half in breadth, by which the Tauric peninsula is connected with the mainland. In ancient times, when the country was colonized by the Greeks, this important pass was shut up by a strong wall with towers, in order to protect the isthmus against the incursions of the Tauro-Scythians; and from that time to the present the fortress and lines of Perekop have been esteemed the key of the Crimea. The Russians since their conquest of this territory, have stationed a strong garrison here; not indeed to defend it from the incursions of the northern barbarians, but, on the contrary, to secure to their armies an easy access, if such of the miserable inhabitants, as have not yet emigrated, should attempt at any time to throw off the yoke of their conquerors.

From Perekop our traveller proceeded by the direct road to Akhmetshet or Sympheropol, the capital of Taurida, where he passed the winter. This town is pleasantly situated in a plain on the banks of the Salgir, a river of extraordinary rapidity, and surrounded and sheltered on every side by fertile hills. The old Tartar part of the town is exceedingly dirty and ill built, and the governor's palace and other edifices, raised since the Russian conquest, are for the most part ruined and abandoned, since the late incorporation of the Crimea with the government of New Russia, and the impolitic restrictions upon its commercial intercourse.

The winter proved unusually stormy and severe, and the large floats of ice

that drifted during several weeks from the sea of Azof into the Euxine, so retarded the progress of vegetation, that the blossoms of the cornel-tree did not make their appearance till the end of March. Before the spring was well confirmed, Professor Pallas set out on a tour to the south-western part of the Crimea, and fixed his head-quarters at Akhtiar or Sevastopol. This is a considerable town, situated on a noble harbour of the same name, which is generally compared to that of Malta or Mahon. A division of the Russian navy is stationed here; but, except security from storms and a productive fishery, this port is possessed of few conveniences. Timber and firewood are extremely scarce and dear; the ships require new sheathing every second year, on account of the ravages of the worm; and the inhabitants of the neighbouring villages have been deterred from supplying the market, by the riotous conduct of the sailors.

The district between the harbour of Akhtiar and that of Balaklava, which also runs a considerable way into the country, was formerly called the Heracleotic Chersonese, and in the time of Strabo was covered with monuments of Greek art and civilization. Under the Genoese, by whom it was afterwards possessed, this colony continued to increase in splendor and consequence. The domination of the Turks and Tartars expelled the merchants, and reduced the towns and villas to heaps of ruins; and even these ruins are rapidly disappearing, since the conquest of the Crimea by the Russians, who take indiscriminately the squared freestone, the blocks and columns of marble, for the construction of barracks and batteries. The remaining fragments of ancient buildings are described by our traveller, together with the numerous and extensive caverns and subterranean chapels of Inkerman, which appear to have been scooped out of the soft limestone rock by the Arian monks, in the later ages of the Byzantine empire, who found here a secure retreat from the persecutions by which they were harassed.

After a minute survey of the mineralogy and antiquities of this neighbourhood, the professor returned to Akh-

metshet, and soon after again set out on a journey along the south-western coast of the Crimea. Not far from Balaklava, in a plain at the foot of a high ridge of limestone mountains, are the pits whence the celebrated Keffe-kil, or earth of Kaffa, is procured. This is a very saponaceous clay of a grey colour, forming a stratum from fifty to seventy feet beneath the surface, and was formerly exported in great quantities to Constantinople, where it was used in the baths by the women for washing their hair. At present, however, only a small quantity of it, about a hundred poods annually, is exported: because, during the late war, when the commercial intercourse with the Turks was interrupted, researches were made in Anatolia, where an earth was discovered in every respect similar to that formerly obtained from the Crimea, and which now serves as a substitute at Constantinople.

The village of Tschorguna, the residence of an intimate friend of our traveller, forms his next resting-place, whence he made several little excursions among the neighbouring mountains; and as the various strata of which the peninsula is composed, are all visible here, the professor takes the opportunity, in this part of his work, of giving a perspicuous general sketch of the orology of the Crimea.

The northern extremity of this peninsula is perfectly flat, and the country continues rising with a very gentle and scarcely perceptible ascent towards the south, for nearly half its length: the surface then becomes undulated, and low single hills, declining towards the north, begin to make their appearance, divided, at first, from each other by plains, and afterwards by narrow valleys, and at length combining into a high connected ridge, terminated abruptly to the south, presenting barren white terraces and precipices. The whole of this tract consists of recent calcareous layers, either of foliated limestone mixed with shells, of chalk interspersed with flint, or of a calcareous marl, easily disintegrable by exposure to the air. This upper stratum rests upon a compact ancient calcareous rock, in some places approaching to the quality of marble; in others in the state of breccia, of a bluish-grey colour, containing but few petrifications and those corallines; sometimes of a greyish black-colour, and then fetid.

This stratum extends beyond the first mentioned tract in a southerly direction, in some places reaching quite to the coast; it declines towards the north in a gradual manner, but forming a larger horizontal angle than the former, and like that is terminated by abrupt precipices to the south. In some places, this calcareous stratum is covered with rubble stone, mill stone, sand stone, agglutinated sand, or loose pebbles: but the higher parts form flats of limestone, called by the Tartars *Yaila*, which afford, during the summer, a cool and plentiful pasturage for their flocks and herds. The loftiest mountains of the Crimea, especially the Tshatyrdag, or Tent mountain, which is about 1200 feet above the surface of the sea, are, for the most part, composed of this stratum.

The limestone beds rest upon slate clay, and almost vertical argillaceous schistus, in which are occasionally found veins and masses of hæmatite; and this is the lowest stratum that has hitherto been observed. The abrupt termination of the mountains upon the southern coast, continues even below the surface of the sea, the only anchoring places being near the promontories; while, for the most part, no bottom is to be found even a single verst from the shore.

The valley of Baidari, which was visited by the late empress of Russia, and has been described in such glowing language by Lady Craven, appears to enjoy a fame superior to its merits: Professor Pallas does not think it comparable to the vales of Caucasus. Its form is that of

“An extensive, oblong and hollow valley, upwards of sixteen versts in length from south-west to north-east, and from eight to ten versts in breadth. On its southern side, it is bounded by the woody alpine terrace of the rocky wall proceeding along the sea-coast; towards the east, by the steep border of the Yaila of Ussundshi, which here presents the lofty mount Tolaka, and likewise by a few other ridges consisting of rock; on its northern side, by similar ridges and eminences, that separate it from the dale watered by the brook Usenbash, as well as from the woody mountains of Kokulos and Aithodor; lastly, on the western side, by the above-mentioned ridge towards Varnutka. The central part of this large valley is hilly, and well provided with wood: from its hollow grounds, the springs, brooks and ditches collect their waters into the Kasikly-Ousehen; which, by means of a narrow valley in the

vicinity of Tshorguna, opens itself a passage towards the north-west, where the mountains are more dissevered, and less elevated. Beside the detached villages of Varnutka and Kutshuk-Miskomia, the dale also contains those of Kaitoo, Baidar, Säftik, Kalendé, Beeyouk-Miskomia, Tylü, Uirkusta, Baga, Ussundshi, Savatka, and Skelä; which are collectively inhabited by at least 700 families of turbulent Tartars. Luxuriant woods, consisting throughout of umbrageous trees, cover this extensive tract, except in such open parts as have been converted into arable land. Excellent oak-trees still occur here; though, during the late war with the Turks, the best timber for ship-building was carried off, in order to supply the Russian fleet stationed in the Black Sea. The walnut-tree likewise prospers uncommonly in this, as well as in the vale of Shulü, and in all the southern vallies environed by mountains, where the oldest and most bulky of these trees are to be met with. In the village of Uirkusta, there is one particularly celebrated: it stands in a garden, is of a prodigious extent, and has in some seasons been productive of from eighty to one hundred thousand walnuts."

The next division of the volume before us, relates the particulars of a journey over the Tshatyrdag, and through the south-eastern mountains of the Crimea: it is principally occupied by minute details of topographical mineralogy and botanical lists, and presents nothing peculiarly interesting to those who are unacquainted with the country.

The last of the author's journies in the Crimea, and that which is the longest and most abundant in curious information, extended through the interior of the Crimea, along the peninsula of Kertsh, and to the isle of Taman. The first interesting object is the town of Karassubazar, the most flourishing of any in the whole country, on account of the brisk and advantageous trade that it carries on with a populous neighbourhood: a considerable number of manufactures are established here; the markets are copiously supplied with cattle, and with fruit and vegetables of all kinds, from the beautiful orchards that surround the place; and the Jews residing here make great quantities of wine. The ruined town of Eski-Krim, near Kaffa, is next described, and presents a melancholy instance, that Russian conquests are to the full as destructive as those of the Turks. The rapacious and desolating spirit of Potemkin was let loose to range uncontrolled in this fine country. He destroyed the relics of

Grecian civilization, and the finest specimens of Tartar architecture, to furnish materials for barracks, distilleries, and churches, of which the greater part were never finished, or have been already abandoned. The abundance of mulberry-trees in this neighbourhood

"Suggested to prince Potemkin the idea of establishing here a seminary for rearing silk-worms, and a nursery for additional plantations. With this view, he engaged in the Russian service a certain count Parma, of Milan; who was appointed director of the institution for raising silk; and, though possessing a very imperfect knowledge of the business, he enjoyed a handsome salary. Several Tartar buildings were also assigned to him, as well as 1,850 dessatines of the richest soil around the town, both for the planting of mulberry-trees, and for settling the colonists devoted to the culture of silk. But the disturbances during the late war prevented the execution of this project on a large scale. The director obtained his pay regularly till the year 1796; and all his efforts have been productive only of from six to ten pounds of silk annually, and in the last year of twenty pounds weight; beside which, he has laid out a nursery of several thousand mulberry-trees. In consequence of such failure, the attempt has been totally relinquished."

The port of Kaffa itself, which from its commerce was called Little Constantinople, and was inhabited for the most part by Greek and Armenian families, which had been the principal emporium of the Genoese in the Black Sea, and had continued to flourish under the rule of the Tartar princes, "since the late Turkish war, when the Russians made themselves masters of Kaffa, and especially after the occupation of the whole peninsula, was almost depopulated, in consequence of the numerous emigrations: so that, with the exception of a few small quarters, it now presents a prodigious heap of ruins, that cannot fail to excite commiseration."

From Kaffa our traveller proceeded to the peninsula of Kertsh and the isle of Taman, a low flat district, resting upon beds of coal and pyritical schistus, and remarkable for springs of petroleum, and the volcanoes of mud which have from time to time broken out here. The latest of these phenomena happened in the year 1794, and is thus described in an official document, written by the inspector of quarantine at Taman:

"On the 27th of February, at half past eight o'clock in the morning, the following

extraordinary events took place at the hill situated on the northern isthmus; which, across the bay, is only twelve versts distant from Taman, but sixty versts by the circuitous road over land. First, a rustling in the air was perceived, with a very violent gust of wind, that did not continue above a minute; and then a noise, resembling thunder, was heard from the hill: soon after, a column of black thick smoke burst forth from its summit, and was succeeded in about a minute by another of violent flame, which at that distance appeared to be at least fifty fathoms high, and thirty in circumference. This flame continued from a little after half past eight till within 10 minutes of 10 o'clock. An express was dispatched, as soon as the flame, the vapour, and the noise had apparently subsided; but he returned with an account, that the hill had rent, and presented an opening, the extent of which could not be ascertained; as every access to it was rendered impossible, by the sudden and successive streams of hot mud that overflowed it in every direction, and were sometimes accompanied with flames and smoke. The eruption, however, was not attended with any shocks of an earthquake.

"According to the collected testimonies of persons, who witnessed the awful scene from Taman and Yenikalé, and who visited the mountain immediately after the eruption, it commenced with a noise resembling a peal of thunder, both in its strength and duration. Prior to, and for some time after the report, the inhabitants perceived a whistling and rustling in the air. A white vapour ascended during the explosion, and was succeeded by a black sooty smoke, through which appeared a column of red and pale-yellow flame, rising in a perpendicular line to double the height of the mountain, and spreading on the top not unlike a sheaf of corn; though a considerable wind agitated the atmosphere. The column of fire was visible for about twenty-five minutes, when it gradually vanished, but the smoke continued from four to five hours; dispersing itself in thick heavy clouds on both sides, which also subsided on the following day. During the first explosion, the hill threw up quantities of mud into the air, and scattered it about in every direction to the distance of a verst. The great mass of mud proceeded from the gulf, or crater, by raising and removing the argillaceous earth from the surface, which at that time was frozen to the depth of seven feet. At first it flowed rapidly, then gradually slower, on all sides of the hill; and, according to the information of credible witnesses, who, a few hours after the eruption, rode thither from the farm, it was not perceptibly warm, though a thick vapour arose from it, owing to the cold state of the atmosphere. Some Kozaks, dispatched to the place, on the contrary, assert that the mud, when first disgorged, was hot. The confused whistling, and bubbling noise were

heard till a late hour of the night; and the mud was forced out sometimes to the height of twelve feet, even on the third day."

The ejected mud was of a deep blue colour and viscid consistence, containing in many places brilliant cubic crystals of pyrites: in the course of the summer, it became hard enough to bear the weight of a man, at which time the crater was upwards of twelve feet in diameter, and a noise was distinctly heard from its bottom, similar to the boiling of a large covered kettle. In order to account for these eruptions, the professor supposes, with high probability,

"That, at a considerable depth under the island of Taman, as also beneath part of the peninsula of Kertsh, there is a stratum of coal or bituminous schistus in a state of slow combustion; and that, in consequence of the discharges which happen so frequently and in so many places, the sea breaks in, and forms bays in the hollows, that have become extinct: hence are generated various kinds of vapours and gases, which by their elasticity force themselves through the clefts of the superincumbent strata, or through old craters; or, where they meet with less resistance, make their way upwards with a loud report; and thus give rise to all the phenomena before mentioned, and also to transient inflammations of hydrogen gas, on the accession of external air. As soon as the force of the vapours, which supported the stratum incumbent on the burning layer, has subsided, in consequence of having found a vent, the fragments of this shattered horizontal stratum fall in succession, and by their pressure discharge the mud, consisting of ashes and sea-water, at first with rapidity, but afterwards more slowly, through the newly formed apertures. Hence we may account for the saline nature of this mud, which still rises with bubbles of vapour, as also for the roots of sedge, which have in some cases been carried by the sea-water into these subterraneous cavities and mingled with the mud; and, lastly, for the fragments of various fossils, through the superincumbent strata of which the vapours have forced their way."

The latter part of this interesting volume consists of general remarks on the Crimea, in which the reader will find much entertainment, as well as instruction.

The principal inhabitants of the Crimea are Tartars, the descendants of those Mongols who formed the army of Tshingis-Khan; in some districts they remain pure and unmixed, exhibiting the characteristic Tartar features, and retaining most of their old customs: for

the most part, however, there is a considerable mixture of Turkish blood, even among their highest nobility; and the inhabitants of the southern vallies, by their strong beard, light hair, and peculiar features, evince how far they are removed from the pure Tartar race. The dress of the wealthier classes resembles that of the Circassians or Poles, except that the head is covered with a cotton cap, generally of a green colour, and edged with black or grey lambskin. The women are handsome, and wear long garments of silk, richly adorned with ermine, fur, or gold lace; they tinge the nails of the feet and hands of an orange colour, and are very skilful in the use of cosmetics.

“Male and female slaves are not common in that country; but the nobility support numerous idle attendants, and thus impoverish their estates; while their chief pride consists in rich and beautiful apparel for themselves and their wives; and in handsome equipages to ride into town; being accompanied by a train of domestics, who follow them on every excursion, though the chief employment of the latter is that of giving their master his pipe, at his demand; standing in his presence, or assisting him to dress; and, in all other respects, living in the same indolent manner as their lords. Another source of expence is the purchase of elegant swords, and especially of excellent blades; the distinction between the different sorts of which, together with their names\*, constitutes among the nobles a complete science. They are also great admirers of beautiful and costly tobacco-pipes, together with expensive mouth-pieces of milk-white amber, that are likewise used by the Turks, and of tubes of curious woods; but the *Kallian*, or the pride of the Persians is scarcely known here; and the Tartars only employ small ornamental bowls made of clay, which are almost every moment filled with fine-cut leaf-tobacco. The generality of these noble lords, or murses, were so ignorant, that they could neither read nor write; and, instead of signing their names, they substituted an impression of their rings, on which a few Turkish words are engraven. Some of the young nobility, however, are beginning to study not only the Russian language, of which they perceive the necessity; but also apply themselves more sedulously to reading and writing, and thus become more civilized. The expence of wearing apparel for the women shut up in their harems is, according to their manner and fortune, little inferior to that of

Europeans; with this single difference, that the fashions among the former are not liable to change. Even the wives of the common Tartars are sometimes dressed in silks and stuffs, embroidered with gold, which are imported from Turkey. In consequence of such extravagance, and the extreme idleness of the labouring classes (who only exert themselves for procuring the necessary subsistence), there are very few wealthy individuals among the Tartars. Credulity and inactivity are the principal traits in the Tartar character. To sit with a pipe in their hands, frequently without smoking, for many hours on a shady bank, or on a hill, though totally devoid of all taste for the beauties of nature, and looking straight before them; or, if at work, to make long pauses, and above all to do nothing, constitute their supreme enjoyments: for this mode of life, a foundation is probably laid by educating their boys in the harems. Hunting alone occasionally excites a temporary activity in the murses, who pursue their prey with the large species of greyhound, very common in the Crimea; or with falcons and hawks.”

The soil and climate of the Crimea are treated of at length, and a very satisfactory account is given of the agriculture and horticulture of the Tartars: the principal articles of cultivation in the fields are winter and spring wheat, and a species called the Greek or Arnaut wheat; it is distinguished from the preceding by being of a bright yellow colour, and semi-transparent. It is imported in large quantities to Turkey and Italy, where it is employed in preparing the best macaroni. Rye and barley are grown in considerable quantities; but oats only on the shore of the sea of Azof, where indeed they generally turn out very ill. Common millet and fox-tail grass are used green as fodder for horses, or the seeds are collected for human food, and as the chief ingredient of the intoxicating drink called *Bura*. Chick pease, flax, and tobacco are also important crops. Artificial irrigation is universally practised in the Tartar gardens, which in consequence yield vast quantities of maize, Bucharian millet, melons, cucumbers, and gourds. The egg-plant, hibiscus esculentus, with all the common vegetables of Europe, are also in general use.

The vine is an object of sedulous culture, and twenty-four different varieties

\* “The principal names of the blades, partly manufactured at Damascus and in Turkey, and partly of those made in Persia, are as follow: *Ters-Maimun* (in which the human face appears totally distorted, whence it derives its name, signifying a distorted ape); *Kirk Merduen*, or forty steps; *Chorassan*, *Sungur*, *Tavan*, &c.”

are enumerated by our author as growing in this peninsula. The vineyards are situated in the bottoms of valleys, for the convenience of watering the plants (which are trained low like currant bushes) during the droughts of summer.

"All the white grapes in Sudagh, Tokluk, and Koos, as well as in other parts of Taurida, are merely pressed in troughs, composed either of large flat stones, or of wood: the lees are passed through presses of a simple construction, and the must, instead of being allowed to work, is poured into casks, the bung-hole of which is left open until the fermentation be completed. These different processes are so negligently conducted, and most of the proprietors permit such large quantities of bad grapes to be expressed with berries of a better quality, that it is matter of surprise to find the wine, in general, tolerably good. On the contrary, those who are more cleanly, and pay greater attention to the preparation of their wines; who suffer the grapes to become perfectly ripe; gather them in favourable weather; pour the juice into clean casks; give the must a small addition of good brandy, previously to fermentation; supply the vessels properly; proceed cautiously in clarifying the wine, which process must be performed in the beginning of March, or earlier; thoroughly fumigate their casks with sulphur, and keep them in good order; such cultivators obtain wines, especially in Sudagh and Koos, which in point of excellence may vie with the best and most salubrious liquors designed for the table. Farther, if the grapes be judiciously selected, dried in the sun, in ovens, or by other means, they will yield a sweetish wine, that is in no respect inferior to what the Germans denominate *Straw-wine*."

A particular section is allotted to the description of the orchards in the Crimea. These appear to have been planted by the Greeks and Armenians; for the trees in almost all of them are old, though very prolific. The pears, apple, quinces, plums, mulberries, and walnuts are remarkably good and plentiful. Figs, pomegranates, peaches, and apricots requiring more attention than the Tartars are willing to bestow, have degenerated, and are reduced almost to a wild state.

The animals of the Crimea are described, perhaps too concisely. The most important is the Tauridan camel, with two hunches: in no other country, we believe, are camels used as beasts of

draught; here they are harnessed to four-wheeled waggons, being scarcely ever employed in carrying either men or burthens. The grey sheep, that furnishes the costly lamb-skins of the Crimea, can only be reared to perfection in the north-western angle of the peninsula.

"Of these handsome grey furs, or *Shmushki*, upwards of 300,000 are in some years exported by the way of Perekop, mostly to Poland; where they are in great request, and sold at a high price. They are disposed of, on the spot, according to their beauty and greater or less abundance, at three rubles and upwards a-piece. They are brought up, chiefly in the spring, when many lambs perish, and are particularly numerous after late frosts and long winters, which prove fatal to many of the young animals in the month of March. The sheep feed principally upon a species of *Centaurea*, that is common in the Crimea, forming large round bushes, with innumerable small flower-buds, by the Tartars termed *Kurai*, or *Bin-Bash*; for which purpose large quantities of it are collected, especially on the *Tarkhanskoi-Kut*. Of black lamb-skins, more than 50 or 60,000 are annually exported from Crime-Tartary."

An account of the salt-lakes, the commerce and manufactures of the Crimea, and the author's journal of his route to Petersburg, conclude the volume.

We consider this work of Professor Pallas's, as incomparably the best of all those that have been published, descriptive of the Crimea; we meet with none of those exaggerations so common among modern tourists; and, in the true exhaustive spirit of a German, the author has left but little to be gleaned by future travellers. In justice to the merits of the book, in its English dress, we ought to mention that the plates and maps are numerous and remarkably well executed, but the translation is by no means free from faults. We can overlook in a work of merit a few Germanisms, and where occasional obscurities arise, can pardon the translator for not making a luminous version of a perplexed original: but his insufficient acquaintance with the science, and even terms of mineralogy, has introduced, in more places than one, errors and inconsistencies that most assuredly are not to be attributed to the learned author.

ART. XXIV. *A Supplement to the Account of the Pelew Islands; compiled from the Journals of the Panther and Endeavour, two Vessels sent by the Honourable East India Company to those Islands, in the Year 1790; and from the oral Communications of Captain H. Wilson. By the Rev. JOHN PEARCE HOCKIN, of Exeter College, Oxford, M. A. 4to. pp. 72. 2 plates.*

WE presume that none of our readers are unacquainted with the interesting narrative, drawn up by the late Mr. Keate, of the shipwreck of the *Antelope*, an East India packet, commanded by captain Wilson, on the Palos or Pelew Islands. The kindness and hospitality with which our countrymen were received by the natives, and the delicate attentions of Abba Thulle, their respectable king, and his worthy brother, must have made a deep and favourable impression upon every mind. The liberal confidence in the honour of captain Wilson evinced by the king, in entrusting to his care Lee Boo, his second son, to be instructed in England in the arts of civilization, is equally to the credit of both parties: and the premature death of this promising youth by the small pox, after a few months residence in London, has, we doubt not, excited the most sincere regret and sympathy.

Although, by the death of Lee Boo, the connection between Great Britain and the Pelew islands might seem to be dissolved, the directors of the East India company were sensible that there yet remained obligations for them to fulfil: they resolved, therefore, to dispatch an expedition to these remote and unfrequented islands, to notify the melancholy event that had taken place, and to manifest their gratitude by a present of such articles, as would be particularly acceptable to the king and his people.

Accordingly, about seven years after captain Wilson had left Pelew, two of the company's vessels were equipped at Bombay, under the command of captain M'Cluer; and Messrs. Wodgeborough and White, who had formed part of captain Wilson's ship's company, were appointed lieutenants. On the 24th of August, 1790, the vessels sailed from Bombay, and after touching at Madras, Ceylon, Bencoolen, Java, and New Guinea, in order to take on board cattle and seeds of various kinds, they arrived at the place of their destination on the 22d of January, 1791.

A most joyful and affecting interview now took place between the English and the natives. The good Abbe Thulle was yet living, but his brother and se-

veral other chiefs, together with Blanchard an Englishman, (formerly one of captain Wilson's crew, but who chose to remain behind among these friendly islanders) had fallen in battle about five months before. When the king was informed of the death of Lee Boo,

"His countenance, which before bore the most evident marks of joy, became composed and thoughtful; and after remaining some time silent, as if wishing to recollect himself, he exclaimed, "*Weel, weel, weel a trecoy!* (in English, Good, good, very good)." The king then paused a little, as if to gain relief; but on his again entering on the melancholy subject, he said, he never entertained a doubt of the goodness of the English, or the captain, but rested assured that they would cherish and take care of his son. That the return of the ships with his friends the English, convinced him his opinion was right, when he gave Lee Boo to the care of captain Wilson; that he had counted upon the line the captain gave him, as far as one hundred knots, or moons, and then despairing of ever seeing his son or the captain again, he had caused the line to be buried, supposing that the vessel which the English had built at Englishman's island (Oroolong) was not large enough to carry them in safety to China, as they had sailed before the good moon set in. He then mentioned the death of Blanchard, but frequently paused in reciting so melancholy a tale, many of his own family having been slain with him in battle."

A few days after, the presents from the East India company were landed, consisting of cattle, sheep, goats, pigs, &c. together with various packages. After a feast given by the king, the packages were opened.

"The effect upon the multitude was wonderful; they were struck with amazement, and could not utter a word, but gave frequent *ha's* of astonishment. The king instantly distributed the arms to the principal rupacks, recommending them to be kept clean, and fit for service when wanted.

"In the morning, the vessels were removed nearer to the shore, and moored within hail; the grindstones, shovels, saws, and remaining packages of utensils were landed and presented to the king: when these were opened, and the different things exposed to view, and their uses were explained to him, Abba Thulle himself was lost in silent thought for some time.

"In about an hour he broke silence, and calling his rupacks and principal people around him, made a long harangue, wherein the word *Engleese* was frequently repeated. He then distributed different articles, with his own hands, to several persons, apparently with a regard to their rank.

"Mr. Wedgeborough relates the account of this transaction, in the following words:

"I was present at the time when the presents were landed, and am sure it is impossible to describe the effect the sight of the different articles had upon the multitude, most of which they were strangers to, even in idea. When arranged before Abba Thulle, and he was told they were for him, he was perfectly at a loss for utterance, or how to express his gratitude to the English rupacks, as he styled the honourable company. He asked why they sent so many things, when they knew he had nothing to send in return; that his country, if he could send it, would be inadequate to the things now before him. At length, being made perfectly to understand that no return was expected; that these things were sent to him from England, in acknowledgment for his great humanity and kindness to our countrymen, when the Antelope was shipwrecked on his coast: he very modestly replied, that the services he had rendered those people were very trifling; for their being situated at Oroolong, put it out of his power to give them the friendly assistance he so naturally wished to have done."

The king, in return, made a present of one of the islands to the English,

which was taken possession of with the usual formalities. Captain M'Cluer having left one of the ships behind to superintend the gardens and new plantations, and take care of the live stock, proceeded with the other to Canton, some of the natives voluntarily accompanying him. He returned to Pelew in June, and had the satisfaction of composing all the differences between his new friends and the Artingall people, without having recourse to violence, and establishing Abba Thulle as acknowledged chief of all the Pelew Islands. The commander thinking his benevolent mission not yet completed, sailed again with both ships to New Guinea and Bencoolen, and returned in January, 1793, bringing two full cargoes of cattle and stores of every kind. During his absence, Abba Thulle had died, and his brother had succeeded to the sovereignty.

From the last intelligence received from these islands, it appears, that a small trade is now carried on occasionally by the English, between Pelew and China; and that the munificent gratitude of the East India company has been attended with complete success; the live stock having greatly multiplied, and the rice producing two abundant crops every year.

## CHAPTER II.

## T H E O L O G Y

AND

## ECCLESIASTICAL AFFAIRS.

SUCH of our readers as take any interest in theological enquiries, will be no less pleased than surprised to learn, that amidst all the agitation of renewed warfare, and all the alarms excited by the peculiar circumstances of our country, this branch of literature has not been neglected. The list of theological publication is nearly as large as usual; and many of the works which it contains are important and valuable.

I. The entrance upon this part of our labours is auspicious. *Dr. Stock*, the learned bishop of Killala, with zeal and industry worthy of the cause of sacred literature, has enriched the catalogue of biblical versions, by publishing "*The Book of the Prophet Isaiah, in Hebrew and English.*" His chief object, indeed, has been to exhibit the original text in a metrical arrangement; but in the progress of his work he has produced a new translation of this sublime prophecy, generally distinguished by correctness and taste. *Mr. J. M. Good* has employed his learning and talents in a similar useful service. He has selected a book usually esteemed sacred, and certainly not undeserving of all the aid and embellishment which can be derived from his extensive knowledge and cultivated taste; and the *Song of Songs* is now presented to the English reader, in a state which must afford him pleasure, though it may not, with all the accompanying notes, appear quite to harmonise with the pure word of God.

*Mr. Warner* has published an English Diatessaron, which we doubt not, will prove an acceptable present to those whose knowledge of the scriptures is confined within the limits of their native language.

A third edition of *Dr. Willan's United Gospel* has appeared, enriched with many useful additional notes.

II. The works which compose the second class in our department, are for the most part valuable. The three volumes of *Notes on the Bible*, by the late *Rev. C. Bulkley*, edited by *Dr. Toulmin*, will be found a very important acquisition to the Student in Divinity. Of *Mr. Bryant*, in his *Observations upon some Passages in Scripture*, some may think—"Arma trementibus ac circumdat nequicquam humeris." These observations are founded upon the principles to which he is well known to be attached, and discover a zeal for the interests of religion, which years cannot lessen. The very learned translator of *Michaelis* having been again attacked by his "Anonymous Adversary," has ably illustrated *The Hypothesis proposed in the Dissertation on the Origin and Composition of our Three first Canonical Gospels*. *Dr. Findlay*, in answer to a passage in *Dr. Geddes' preface* to the second volume of

his Translation of the Bible, has published a little tract of considerable merit, upon *The Divine Inspiration of the Jewish Scriptures, asserted by St. Paul, 2 Tim. iii. 16.* Another Scottish divine, of the name of M'Conochie, has ventured upon a new hypothesis, which he has stated in "*A Dissertation concerning the Writer of the Fourth Gospel;*" and Mr. Granville Sharp has met with an able but no courteous opponent to his system concerning "*The Use of the Article in the Greek Testament,*" in a writer who stiles himself not inaptly, *Gregory Blunt.*

III. Upon the evidences of natural and revealed religion, the publications of the last year are neither numerous nor important. The Rev. T. Robinson's "*Enquiry into the Necessity, Nature, and Evidences of Revealed Religion,*" may be considered as a useful compilation. The *French Translation*, by M. Chirol, of the Bishop of London's *Abridgment of the principal Proofs, &c.* is deserving of commendation. An anonymous essay on *The Mild Tenor of Christianity*, will be read with pleasure and advantage. Mr. Crighton's *Enquiry into the Origin of True Religion*; and Dr. Priestley's Tract, entitled, *Socrates and Jesus compared*, claim a place in the list of those publications which are designed to promote the cause of revelation.

IV. Though necessarily of a mixed nature, yet Dr. Hill's *Theological Institutes* will be most properly referred to the class of controversial or dogmatical Divinity, and takes the lead among the works of this kind, which have issued, during the last year, from the press. Mr. Vidler in his *Letters to Mr. Fuller on the Universal Restoration*, has shewn himself an able disputant upon an important article of christian doctrine. Dr. Hales has very successfully opposed the fanaticism and the ignorance of some self-constituted teachers, in a pamphlet entitled *Methodism Inspected*; and a more serious attack has been made upon the same denomination of christians, by Mr. Nott, in his *Bampton Lectures*. A writer among the Quakers, who signs himself *Verax*, and who has already signalized himself as a champion against orthodoxy, has published, in reply to his antagonist *Vindex, A Vindication of Scriptural Unitarianism, and some o'ler primitive Christian Doctrines.*

V. The Sermons of the last year are uncommonly numerous. Not fewer than ten volumes have fallen under our notice. The authors are Dr. Brown of Aberdeen, Dr. Gleig of Stirling, Dr. Shepherd, the Rev. Messrs. Gilpin, Nares, St. John, Warner, Buddo, Tayler, and a Layman.

Many patriotic effusions have passed from the pulpit to the press, in the form of *Single Sermons*. Among these are, *Broadhurst's* Sermon at Bath, *Bulmer's* at Thorpe, *Overton's* at York, &c.

The Fast-Day also, as might have been expected, has furnished us with excellent discourses, from the pens of *Parr, Belsham, Rees, Butler, Disney, Glasse, Madan, Jervis, Corrie, &c. &c.*

Besides these, Sermons upon miscellaneous subjects have been published by *Wrangham, Kentish, and Skurray.*

From the Society for the Suppression of Vice, the public have received *An Address, setting forth the Utility and Necessity of such an Institution.* Mr. Fellowes has printed *A Supplement to a Picture of Christian Philosophy*; and Mr. Eaton has in *A Familiar Conversation*, endeavoured to inculcate the Christian Virtues of *Moderation, Candour, and Liberality.*

VI. No works of devotion have appeared during the last year.

VII. The controversy which has been excited by those who call themselves "The True Churchmen," is still going on; and its conclusion is, we apprehend, yet at a great distance. Mr. Daubeney has, during the past year, added himself to the list of Mr. Overton's opponents; and endeavoured to repel from the articles of the church, the charge of Calvinism, in a work entitled *Vindicia Ecclesie Anglicanae*. Dr. Prettyman also has more briefly attempted the same, in *A Charge delivered to the Clergy of his Diocese*; and the editors of the Churchman's Remembrancer have republished, in the same cause, *Dr. Winchester's Dissertation on the xviith Article of the Church of England*. Mr. Myles has published a *chronological History of the Westleian Methodists*, which furnishes much information respecting the rise and progress, and internal government of this formidable sect.

It was not to be expected that Mr. Hook's *Anguis in Herba*, noticed in our last volume, would pass without animadversion, from those who consider *Pluralities* and *Non-Residence* incapable of being defended; *A Reply* has accordingly appeared, written by *A Member of the Established Church*.

These, with a few of less note, constitute the works in Theology, which have been published since we closed our former volume, and of which we now proceed to give a fuller account.

## THE SCRIPTURES.

ART. I. *The Book of the Prophet Isaiah: in Hebrew and English. The Hebrew Text metrically arranged: the Translation altered from that of Bishop Lowth. With Notes critical and explanatory. By JOSEPH STOCK, D. D. Bishop of Killala, M. R. I. A. and formerly Fellow of Trinity College, Dublin. 4to. pp. 185.*

NO part of literature promises to be productive of more valuable consequences, than that which embraces the important objects of restoring the purity of the original scriptures, and of presenting them to the unlearned reader, in versions more free from error than those which are now in his hands. And it is one of the pleasing features of the present age, that men, high in rank and in renown for learning, devote their talents and their time to this excellent pursuit. Our shelves groan under the massy folios of learned and laborious interpreters; our libraries overflow with erudite researches into the meaning of passages, many of which owe all their difficulty to the error or the ignorance of a transcriber; and become plain and intelligible by a different reading, supported by the authority of an ancient copy; or suggested by skill, acquired in an habitual attention to sacred philology. The industrious commentators of former times are not to be contemned: their learning and their zeal have illuminated many an obscurity, and unra-

velled many an intricacy in our holy books: but the labours of Wetstein, Mill, and Kennicott have encouraged a more useful race of biblical critics, whose elucidations are more attractive to persons of genius and of taste, and adapted to become more speedily and more generally beneficial. In this distinguished and meritorious service, our own country has already earned the highest praise; and scarcely a year passes which does not add another name to the honoured list of those, who, by labouring to recover the original text, and to render perfect our already valuable English version, perform the most acceptable service which criticism can render to the world, and prove themselves the real friends and benefactors of mankind. To the revered names of Newcome, Lowth, Blaney, Chandler, Dodson, Geddes, Campbell, Wakefield, &c. we have now to add that of Stock, an Irish prelate, *haud parvi nominis*. From the editing of Greek and Roman classics, he has very laudably turned his talents to sacred criticism. To this he was

incited by his friend and relation, the late archbishop Newcome; and the leisure that was necessary, he found during the late troubles in Ireland, which drove him from the active duties of his station, and compelled him to seek a retirement favourable to the pursuit of sacred literature.

"In the space of one year," he observes, "I had read over the greatest part of the Old Testament in Hebrew; and, during my progress, my ear became so accustomed to a certain rhythm, or metre, seeming to pervade the whole of that sacred volume, that I rested at last in a conviction that not the psalms and the prophecies only, but the historical parts also, commonly supposed to be written in prose, are in fact composed in verse, with no other difference from the rest but that they want the ornaments and bolder features of poetry."

Like the right reverend translator, we are "not fond of controversy, especially in questions of no great importance, and confessedly difficult of solution;" but it is our duty to offer some observations which have occurred to us upon that which constitutes the leading feature of his work.

His Lordship thus states what appears to him to be fact, with respect to Hebrew metre. Preface p. viii.

"The manner of chaunting the psalms in our cathedrals, which has flowed, without interruption, into the Christian church from the Jewish, affords, in my apprehension, the easiest and clearest answer to the question, What is Hebrew metre? The psalms, we know, are divided into verses; verses into two parts, responsively sung by the choir; and of these parts each is distributed into musical bars of the length of four crotchets, which is called *common time*; all words included within the same bar, be they many or few, are pronounced by the choir in the same *time*; the many rapidly, the few by a lengthened utterance, without regard to quantity, or the importance of the respective words in the sentence. Bars of this description measure the length of the Hebrew verses, at least of far the greatest part of them; so that to the four crotchets in the bar the ear discerns four rests, or feet, corresponding in the verse, and the measure becomes exactly similar to that of our English verses of eight syllables, as in the hundredth psalm,

With one consent, let all the earth  
To God their cheerful voices raise, &c.

The exceptions to this general rule are, that sometimes in a stanza a line of the common length is succeeded by one of three feet or six syllables, as in Lam.

ch. iii. throughout: and frequently a stanza is made to begin or end with a hemistich, instead of a whole line, of which the very first line of David's psalms presents an example."

That the nature of Hebrew metre is such as is here represented, we shall not pretend either to deny or assert. The subject appears to us, after much deliberation, involved in impenetrable obscurity. Of a language, concerning the mode of reading which there has been so much dispute, and ever will be so much real difficulty, we think it vain to expect to discover the proper rhythm. No doubt it *was* capable of poetic numbers, and a great part of the books of the Old Testament was composed in a manner which adapted them to the purpose of recitation to musical instruments; but no attempt to reduce them to their original measures, we are fully persuaded, can now be successful. Of the scheme of bishop Hare, we may venture decidedly to speak as fanciful and erroneous; and the more simple systems of Newcome, Lowth, and Stock, are open to objections, which their own labours furnish. The bishop of Killala, indeed, goes far beyond all his predecessors, when he converts prose into verse, and imparts to a genealogical table the dignified march of a religious ode. That one of the earliest methods by which the descendants of the patriarch Abraham conveyed the knowledge of past events to their posterity, was by giving them a poetical form, may be inferred from the uniform practice of remote antiquity; but that in the more advanced state of the Jewish people, in the days of Ezra, or even of David, their history was metrical, is a position which will not be easily proved, or readily admitted. Hebrew scholars will, in general, perceive some greater difference than the mere want of ornament, between the song of Moses after the passage through the Red Sea, and his directions concerning the formation of the tabernacle; and conceive that something more than the absence of the bolder features of poetry, distinguishes the book of Nehemiah from the love song of Solomon.

Whatever may be thought of the bishop of Killala's system, and of the extent to which he applies it, his zeal and diligence will meet the highest praise.

"Persuaded," he observes, preface p. ix.

"of the fact, that the general run of verses throughout the Old Testament, are what the learned bishop Lowth distinguishes by the appellation of *Tetrameters*, I conceived a wish to see how the first of the prophets, Isaiah, would appear in his proper dress, as a poet, his lines being reduced to metrical arrangement. Accordingly, I prescribed to myself the laborious task of transcribing the original; purposing at the same time to accompany the text with the justly celebrated version of bishop Lowth, corrected where it should appear necessary, either by the late discoveries of the excellent German critic and translator, Rosenmüller, or by my own observation."

Strictly adhering to his system, Dr. Stock has thrown into a metrical form, not only those parts of Isaiah which are confessedly historical, and taken with very little variation from the book of Kings, but even the titles of the different prophecies which are introduced into this oracular fasciculus: with what effect let the reader judge.

Ch. i. v. 1.

"The vision of Isaiah, the son of Amos,  
which he saw concerning Judah and Jerusalem,  
In the days of Uzziah, Jotham, Ahaz,  
Hezekiah, kings of Judah."

Ch. xxxvi. 1.

"It came to pass in the fourteenth year  
Of king Hezekiah,  
There went up Sennacherib, king of Assyria,  
Against all the fenced cities of Judah,  
And he took them."

Ch. xxxvii. 2.

"And he sent Eliakim, who was over the household,  
And Shebua the scribe,  
And the elders of the priests,  
Covered with sackcloth,  
Unto Isaiah, the son of Amos, the prophet."

v. 12.

"Have the gods of the nations delivered those  
Which my fathers have destroyed;  
Gozan and Haran,  
And Rezech, and the sons of Eden, which  
were in Thelassan?"

By the help of masoretic punctuation, the originals of these passages are made to assume something like the appearance of metrical arrangement; but is it credible that these plain and undignified relations should have been invested even with the exterior garb of poetry? Remove the points, and the charm is dissolved. Take away this artificial clothing of the

masora, and not even the *disjecti membra poetæ* will be found.

In his arrangement of the stanzas, which are generally acknowledged to be poetical, Dr. Stock is not always more successful. We cannot perceive any advantage that is derived from such a location as the following.

Ch. vii. 17.

"Jehovah shall bring upon thee, and upon thy people,  
And upon thy father's house, days,  
Such as have not come, from the day that Ephraim departed  
From Judah; even the king of Assyria,"

Ch. xv. 5.

"The heart of Moab belloweth out at the bare approach thereof,  
Even to Zoar, like a heifer of three years -  
For in the ascent of Luhith, with weeping  
Shall weeping go up; in the road of Hironaim  
The cry of destruction they shall raise up."

Ch. xxi. 8.

"And he cried, A caravan!  
Sir, on my watch I stand  
Constantly, during the day; and on my ward  
Have been set for nights together."

The division in the Hebrew exactly corresponds with that which is preserved in the translation; and a small portion of taste only is necessary to convince the reader, that such an arrangement is not deserving of the name of verse. Such instances as these are indeed few: but in many passages, we think, the bishop's ear has deceived him, and induced him to make some lines too long, others too short; injudiciously to mix hexameters, tetrameters, trimeters, and dimeters; and occasionally to destroy the parallelism, which appears to us to constitute the surest guide in the mazes of Hebrew poetry. The bishop has trusted too much to the Masorètes, with whose cumbersome punctuation he has loaded and disfigured his page.

It is time to advert to the translation. Here the bishop has been more fortunate. His first object, as we have already seen, was to produce a metrical arrangement of the Hebrew text, accompanied with the version of Lowth, corrected where necessary. As he proceeded, corrections of this nature became more numerous than he expected, till, at length, almost a new translation arose. To judge, therefore, of the real advantage which the labours of Dr. Stock have produced to sacred literature, (for all relating to

metrical arrangement, we think of little or no importance,) we must examine how far he has improved the version of the bishop of London. To select every passage in which an important alteration is made, would needlessly occupy our pages; all that is necessary, and all that will be required, is the quotation of a few of the more striking examples.

Ch. i. 17. Lowth, following Bochart, and not to his own satisfaction, translated **אשרו המוע** "*cursed that which is corrupted.*" Stock, justified at least by all the versions, renders these words, "*Help forward the aggrieved.*"

iv. 5. "Yea, over all shall the glory be a covering," Lowth.—"A burning that shall overshadow all glory," Stock. *i. e.* a conflagration, whose splendour shall eclipse all glory. The great objection to Lowth's rendering is the violation of grammar, a masculine noun being made the nominative to a feminine verb.

vi. 13. **ועורבה עשיריה  
ושבה והיתה לבער**

"And though there be a tenth remaining in it,  
Even this shall undergo a repeated destruction." Lowth.

"But yet in it shall be left a tenth,  
And it shall recover and serve for pasture."

Two versions cannot more widely differ than these. Dr. Stock ably and successfully defends that which he has adopted.

x. 13.

"And I have brought down those that were strongly seated." Lowth.

"And I have let fall the curtain of the inhabitants." Stock.

"The metaphor," he observes in a note, "here employed, appears to me to have escaped the commentators, by their not knowing the meaning of the word **כביר** which is well explained by Parkhurst to denote a mosquito net or curtain, used in hot countries by people of the better sort, to guard them at night from the noise and stings of those very troublesome insects, the gnats. It is a thin curtain of gauze or goat's hair, let down from the tester of the bed, enclosing it on every side, and thereby completely concealing the person in bed from view. To let fall the curtain of the inhabitants, therefore, is to hide them from view, to put them out of sight, by destroying them."

Ch. xi. 14. What in Lowth's version is rendered,

"But they shall invade the borders of the Philistines westward;"

Dr. Stock has translated,

"But they shall fly on the shoulders of the Philistines westward."

"They shall extend their conquests from the west to the east; and this they shall effect by the help of such as were formerly their bitterest enemies; the Philistines shall aid them with shipping, (which is what is here meant by flying on the shoulders of the Philistines); Edom, &c."

Ch. xviii. 1.

"Ho! to the land of the winged cymbal." Lowth.

"Ho! to the land shadowed with sails." Stock.

Rosenmuller interprets it, "the land of the double shadow." Dr. Stock well observes, "the ancient versions agree in speaking of sails in this place, of which *wings* **כנפיהם** are an apt representation; and the rest of the description points to nautical business."

Ch. xxxvii. 13.

"Of Honah and of Ivah."

Upon this passage, Dr. Stock has added at the end of his work a note, which we recommend to the attention of our readers.

"In thus translating the words **רעיה חנע** I have been misled by the crowd of former interpreters, who concur in representing them as proper names. On reflection I am persuaded they are not so, but should be rendered, *removed and overturned*; that is each of those several princes, who opposed the Assyrian monarch, is now a vagabond and reduced to ruin: a forcible conclusion of the argument addressed to Hezekiah. If I am right in this interpretation, I owe the discovery to a perusal of Dr. Hutter's excellent translation of the New Testament into Hebrew, a work which I cannot sufficiently commend, as a great help to scholars desirous of becoming well versed in Hebrew phraseology," &c.

This translation has been republished in England, to the conclusion of the Acts, by the Rev. R. Caddick, of Christ Church, Oxford.

Ch. liii. 3.

"Despised, nor accounted in the number of men." Lowth.

"He is despised and abject above all men;" **אישים** belongs here to both the preceding words, *despised* and *abject*, and is used in Hebrew and Arabic as a mark of the superlative degree: *abjectus virorum*, *i. e.* homo abjectissimus." Stock.

These few specimens may enable our readers to judge in some measure of the work of the right rev. translator. Our limits will not allow us to quote many other improvements upon the version of Lowth. There are larger portions in which his critical skill is more apparent, and his success of greater importance: among these we mention particularly the concluding verses of the third chapter, and the prayer of Hezekiah, ch. xxxviii. in the rendering of which, however, he acknowledges his obligation to Scheidnis, a German critic.

In departing from the version of Lowth, he has not always displayed the same judgment or taste.

Thus in ch. xxx. 17, Dr. Stock omitted the term *ten thousand*, which Lowth has shewn to be necessary.

“One thousand at the rebuke of one;  
At the rebuke of five, ten thousand of you  
shall flee:

is certainly to be preferred to

“One thousand at the rebuking of one,  
At the rebuking of five shall ye flee.”

“The crown of the cup of reeling  
Thou hast drunken, thou hast swooped off:”

is, we conceive, no improvement upon bishop Lowth's rendering of ch. li. 17.

“The dregs of the cup of trembling, thou  
hast drunken, thou hast wrung them out:”

*swooped* means to fall like a hawk upon its prey.

“I will give them the reward of their work  
with faithfulness:”

which is Lowth's rendering of ch. lxi. 8. is not judiciously neglected for

“I will give them their toil's-worth honestly.”

Other instances of a similar nature might be quoted.

The notes which accompany this version are “drawn into the narrowest compass consistent with usefulness.” In these the author “confines himself very much to the province of a verbal critic, leaving (as he modestly says) to those who are better qualified for the undertaking, the important office of unfolding the mystical sense of the prophet, or

of shewing the accomplishment of his predictions.” The conjectural emendations, which are suggested or defended in these, are frequently judicious, and some of them admitted very properly into the text. Ch. i. 8. for נצירה *pressed with siege*; Dr. Stock would read נצולה *pillaged*. Ch. xvii. 11. for נהלה *possession*, he proposes כהלה *hurry*. Ch. xxi. 8. for אריות *a lion*, he reads אוחה, “which denotes a company of persons on a road, and was a natural exclamation for the watchman who descried them.” Ch. xxix. 2. for כאריאל which Lowth interprets, *as the hearth of the great altar*; Doederlein and Rosenmuller, *as a strong lion*; Dr. Stock proposes to read כאריותאל *tanquam a Deo decerptus, the torn of God*. This ingenious reading receives no little support from the version of the lxx and the Arab.—These may serve as specimens.

Amidst these we wish the bishop of Killala had admitted the conjectural emendation of Ch. xiv. 12. שלח or שולח or rather שלוח for הולש which Mr. Wakefield long since proposed in his edition of Virgil's Georgics, of which the learned translator could not be ignorant; and which, without the support of the lxx, would recommend itself to every person of taste and judgment.

Before we conclude this article, we must be allowed to express our surprize that, in this valuable edition of the prophecy of Isaiah, no notice whatever is taken of any of the *Varia Lectiones*, published by De Rossi.

Though all the copies he has collected may not have equal authority, there are some readings which present a just claim to notice, and from which every editor and translator of the sacred text may derive considerable assistance. We could point out passages, in which Dr. Stock might have applied to this useful work with much effect.

Nor do we think that Dodson's version should have been altogether unnoticed; which, although the work of a layman, and undertaken upon a principle which can never be fully established, is not below the respectful regard of a scholar and a prelate.

ART. II. *Song of Songs: or Sacred Idyls. Translated from the Original Hebrew, with Notes Critical and Explanatory.* By JOHN MASON GOOD. 8vo. pp. 210.

IN his notes upon bishop Lowth's prelections, the learned professor Michaelis has observed, "that no interpreter of this exquisite poem has yet appeared, properly prepared for the task: all who have hitherto attempted it, having been more solicitous to explain the mystical sense, than to exhibit its first and obvious meaning as a song of love." The task, indeed, he acknowledges to be by no means easy. "He who undertakes it, must be deeply skilled in the Oriental languages; well versed in the knowledge of ancient manners; acquainted with natural history; accustomed to the frequent reading of Arabian poetry, especially of the amorous kind; and lastly, must be himself a votary and a favourite of the muses."

In none of these qualifications does Mr. Good appear deficient. His knowledge of the Oriental languages, both ancient and modern, is extensive; with the love-songs of the Arabians he seems to be intimately acquainted; and to a true taste for poetry, he unites the character of no mean poet. They who may differ from him in respect to the propriety of every part of the arrangement which he has adopted, or not admit the justice of all his renderings, must still regard this as by far the most elegant, and, at the same time, the most faithful translation which has yet been given of this beautiful poem.

"The Song of Songs," (he observes in his preface) "has hitherto been generally regarded as one continued and individual poem either as an epithalamium (*expositio nuptialis*) accompanied, in its recitation, with appropriate music; or a regular drama, divisible, and, at first, clearly divided into distinct acts or periods. Since the commentary of the learned and elegant Bossuet, bishop of Meaux, upon this admirable pastoral, and more especially since the confirmation of his ingenious conjecture by that excellent critic, the late bishop Lowth, the latter opinion has more generally prevailed; and the poem has been arranged into seven parts, one being appropriated to every day of the bridal week, or period of time allotted among the Hebrews for the celebration of the nuptial solemnity.

"Great as are the authorities for both these speculations, I have ventured to deviate from them in the version now offered to the public. The Song of Songs cannot be one connected epithalamium, since the transitions are too abrupt for the wildest flights

of the oriental muse, and evidently imply a variety of openings and conclusions; while, as a regular drama, it is deficient in almost every requisite that could give it such a classification: it has neither dramatic fable nor action; neither involution nor catastrophe; it is without a beginning, a middle, or an end. To call it such, is to injure it essentially; it is to raise expectations which can never be gratified, and to force parts upon parts which have no possible connection. Bishop Lowth himself, indeed, while he contends that it is a drama, is compelled to contemplate it as an imperfect poem of this description.

"It is the object of the present version, therefore, to offer a new arrangement, and to regard the entire song as a collection of distinct idyls upon one common subject, and that, the loves of the Hebrew monarch and his fair bride: and it has afforded me peculiar pleasure to observe, from a passage I have accidentally met with in the writings of Sir William Jones, long since the composition of the present work, that some such opinion was entertained by this illustrious scholar.

"In forming this arrangement, I have followed no other guide than what has appeared to me the obvious intention of the sacred bard himself: I have confined myself to soliloquy, where the speaker gives no evident proofs of a companion; and I have introduced dialogue where the responses are obvious: I have finished the idyl where the subject seems naturally to close; and I have recommenced it where a new subject is introduced. Thus divided into a multitude of little detached poems, I trust that many of the obscurities which have hitherto overshadowed this unrivalled relique of the Eastern pastoral, have vanished completely; and that the ancient Hebrews will be found to possess a poet who, independently of the sublimity of any concealed and allegorical meaning, may rival the best productions of Theocritus, Bion, or Virgil, as to the literal beauties with which every verse overflows." *Preface p. iii.—vi.*

Agreeably to this system, the whole poem is divided into *twelve* idyls; the new translation, metrically arranged, occupies one page; and on the opposite page is a corresponding poetical version, to which the notes, which are numerous and interesting, are adapted. We shall select as a specimen the fourth idyl, both because it is short, and is accompanied by notes which will serve to shew the general character of that part of the book, and introduce a beautiful little poem from the Persian.

## IDYL IV.

## ROYAL BRIDE.

## Ch. iii.

1. On my bed, in the night,  
I sought him whom my soul loveth.  
I sought him, but found him not.
2. I arose, and went into the city;  
In the streets, and in the broad-ways,  
I sought him whom my soul loveth:  
I sought him, but I found him not.
3. The watchmen of the city beheld me:  
“Saw ye,” said I, “him whom my soul  
loveth?”
4. But a little had I passed from them,  
When I found him whom my soul loveth:  
I held him, and would not let him go,  
Till I had brought him into my mother's  
house,  
Into the dwelling of her who conceived  
me.
5. I charge you, O ye daughters of Jerusalem!  
By the roes, and by the hinds of the field,  
That ye stir not, nor awake  
My beloved until he please.

Mr. Good's version is as follows.

## ROYAL BRIDE.

“’Twas in the night: my head the pillow  
pressed,  
And anxious dreams, disturbed my throbbing  
breast;  
I sought the darling object of my pain;  
Intent I sought him—but I sought in vain:  
Abrupt I rose, in hopes my love to meet;  
Wide through the city, wearying every street,  
I sought the darling object of my pain;  
Intent I sought him—but I sought in vain.  
The midnight watchmen found me as I  
strayed;  
Of them I sought, with spirit deep dismayed,  
“Saw ye the darling object of my pain!”  
Of them I sought him—but I sought in vain.  
Not long I left them, ere, with rapture  
crowned,  
The darling object of my pain I found.  
I held him firm, forbade him more to roam,  
And instant brought him to my mother's  
home.  
Daughters of Salem born!—by all ye prize,  
The graceful hind, the roe with luscious  
eyes,  
I charge you stir not—hushed be every breeze,  
Watch o'er my love, nor wake him till he  
please.”

## NOTES.

“And anxious dreams—) The word  
“dream” does not occur in the original;  
but from the period of time, the place, and  
position of the fair bride, there can be no  
doubt she is here describing a dream. In  
the earlier ages of the world, in which visions  
of the night were made the medium of

divine communication, as well to those who  
were without the pale of the Jewish hie-  
rarchy, as to those whom it embraced, dreams  
were pondered upon with far more defer-  
ence than at present; and, for this reason,  
the images in natural sleep appear to have  
been often more vivid and permanent.  
Much of the beauty of ancient poetry,  
therefore, both sacred and profane, has been  
exhausted in delineating the history of indi-  
vidual dreams. In the sacred scriptures this  
is so frequent as to render it useless to enu-  
merate instances. In Virgil, Moschus, and  
Bion we meet with many similar narratives;  
but the Odes of Anacreon are, of all spec-  
imens of poetry, the nearest, perhaps, in this  
respect, to the idyls before us. The third  
and eighth, in the arrangement of Barnes's  
edition, are both of this description most  
precisely: and the former, in its general tale  
and construction, so extremely resembles  
the seventh of the present idyls, that the  
reader will find it introduced under the poem  
for a comparison. Gessner has happily re-  
ferred to this species of poetic fiction in his  
idyl, entitled *Daphnis*. The delighted swain  
applies to heaven, and supplicates that  
dreams of love and of himself may descend  
on the fair idol of his heart: and if she do  
not dream of him, his object, at least, is  
obtained by the supplication; for when the  
morning arose, and his beloved appeared at  
her window—*holdselig grüßt sie ihn und hold-  
selig blickt sie ihn nach;—denn sie hatte seinen  
mächtlichen gesang behorcht*—“tenderly she  
saluted him, tenderly her eyes still followed  
his footsteps:—for she had listened to his  
midnight song.”

“Intent I sought him—but I sought in  
vain. This lineal iteration, chorus, or in-  
tercalary verse, as it is called by Dr. Lowth,  
is in perfect unison with the true spirit of  
the idyl or eclogue. Theocritus is full of  
the same figure: his very first idyl affords us  
an instance of it—

*Ἀρχετε βακοδικας, Μωσαις φιλοι, αρχετε' αοιδας,*

which is repeated at the commencement of  
every sentence, till the poet has nearly finished  
his song.

“The first idyl of Bion, in like manner,  
offers us a similar instance—

*Αιαζω τον Αδωνιν· Απωλετο καλος Αδωνις·*

The latter part of the verse being in a small  
degree, and with great elegance, varied in  
almost every recurrence.

“Gessner has occasionally introduced a  
similar iteration, though not very frequently.  
The first idyl, however, furnishes us with  
an example in the soliloquy of Alexis, who  
concludes his pathetic apostrophes with,  
“*Ich sie liebe mehr als die biene den fröling  
liebt*”—“I love her more than the bee loves  
the spring.”

“The lyrists of every country, both sa-  
cred and profane, have been as attentive to

this beauty as the pastoral poets. It occurs in a great variety of the psalms, and other poetical parts of the bible; and the reader may also turn to Anacreon's Ode xxxi, in which the burden is—

Θελω, θελω μαννυσι.

"The Gazels of the Asiatics are often composed with the same spirited figure. In a paper on the resemblances of Grecian and Oriental poetry, which I some time ago inserted in the Monthly Magazine, I gave an instance of it from one of the Gazels of Hafiz. The following, to an unknown fair, from Khakani, will afford the reader another example.

"What art thou?—say: with cypress shape;

Soft jasmine neck, but flinty heart:  
Tyrant! from whom 'tis vain to escape—  
O tell me who thou art?

I've seen thy bright narcissus-eye,  
Thy form no cypress can impart:  
Queen of my soul! I've heard thee sigh—  
O tell me who thou art?

Through vales with hyacinths bespread  
I've sought thee, trembling as the hart:  
O rose-bud-lip'd! thy sweets are fled—  
Tell, tell me who thou art?

Wine lights thy cheeks; thy steps are snares;  
Thy glance a sure destructive dart:  
Say, as its despot-aim it bears,  
What fatal bow thou art?

Thy new-moon brow the full moon robs,  
And bids its fading beams depart:—  
Tell, thou, for whom each bosom throbs,  
What torturer thou art?

Drunk with the wine thy charms display,  
Thy slave Khakani hails his smart:  
I'd die to know thy name!—then say  
What deity thou art?"

"Longpierre has quoted an ancient and anonymous epigram, so perfectly correspondent with the idyl before us, excepting that the research of the devious lover is not crowned with the same success, that I cannot avoid citing it, nor conceiving that the idea was suggested by this beautiful passage in the Song of Songs."

"Lecto compositus, vix prima silentia noctis  
Carpēbam, et somno lumina victa dabam:  
Cum me sāvus Amor prenum, sursumque  
capillis

Excitat, et lacerum pervigilare jubet.

"Tu famulus meus (inquit) ames cum mille  
puellas,

Solus, Io, solus, dure jacere potes?"

Exsilio; et pedibus nudis, tunicaque soluta,

Omne iter impedio, nullum iter expedio.

Nunc propere, nunc ire piget; rursumque  
redire

Pœnitet; et pudor est stare via media.

Eccē tacent voces hominum, strepitusque  
ferarum,

Et volucrum cantus, turbaque fida canum.  
Solutus ego, ex cunctis paveo somnumque;  
torumque,

Et sequor imperium, sāvę Cupido, tuum."

"In bed reclined, the first repose of night  
Scarce had I snatched, and closed my con-  
quered eyes,

When Love surprized me, and with cruel  
might,

Seized by the hair, and forced me straight  
to rise.

"What! shall the man whom countless  
damsels fire,

Thus void (said he) of pity, sleep alone?"  
I rose barefooted, and, in loose attire,

Block up each avenue, but traverse none.  
Now rush I headlong—homeward now re-  
treat—

Again rush headlong, and each effort try;  
Ashamed at heart to loiter in the street,

Yet in my heart still wanting power to fly.  
Lo! man is hushed—the beasts forbear to  
roar,

The birds to sing, the faithful dog to bark—  
I, I alone the loss of bed deplore,

Tyrannic love pursuing through the dark."

The second idyl of Moschus is constructed upon precisely the same plan. It thus opens most beautifully;

Εὐρώπη ποτε Κυπρίῳ ἐπὶ γλυκύν ἦκεν οὐρίῳ  
Νυκτὸς ὅτε τριτάτῳ λαχὸς ἰστάται, ἐγγυθὶ δ' ἦναι  
ἵππος ὅτε γλυκίων μελῖτος βλεφάρουσιν ἐρίζων,  
Λυσίμελης, πῶδα μαλακὰ κατὰ φάρα δεσμών,  
Εὐτε καὶ ἀτρεκέων παλμῖνεται ἔθνος οὐρίων.

Nigh was the dawn; the night had nearly  
fled.

When a soft dream approached Europa's bed;  
'Twas Venus sent it: honey from the cell  
Not sweeter flows, than flowed the sleep that  
fell:

Loose lay her limbs, her lids with silk were  
bound,

And fancy's truest phantoms hovered round."

The name of the fair bride, in whose honour these amatory idyls were composed, is not come down to us; nor is it yet agreed among commentators who she was. She has generally been regarded as the daughter of Pharaoh: but as Mr. Good very justly observes, "the few circumstances that incidentally relate to her history in these poetical effusions, completely oppose such an idea." Our author also, with great probability, conjectures, that the marriage between Solomon and the Egyptian princess was a match of interest and policy: whereas, on the contrary, the matrimonial connection here celebrated, was one formed

upon the tenderest reciprocal affection. From the bride's own words we learn that she was of Sharon, a canton of Palestine, and from the respectful attention paid to her by her attendants, and the appellation with which they address her, we have reason to believe, that, "though not of royal, yet she was of noble birth."

"How long," observes Mr. Good, "his (Solomon's) partiality for this accomplished bride continued, we know not. The histories of his life, which would probably have given us some information upon the subject, and were composed by the prophets Nathan, Abijah, and Iddo, have unfortunately followed the fate of all his own works, except the book of Proverbs, of Ecclesiastes, and the Song of Songs. The anonymous histories of him which are still preserved, however, in the sacred books of Kings and Chronicles, are minute and explicit in many points; and it is probable that the lady did not long live to enjoy his affection, or her name and some anecdotes relating to her would have been here communicated. That the Hebrew monarch conducted himself with great kindness towards her, we may fairly conclude from the uniformity of his actions and the known generosity of his disposition, a generosity that induced him, seven or eight years after his marriage with the daughter of Pharaoh, to build for this princess a superb palace, in splendor resembling his own, at a distance from the city of David; and which tempted him, in direct disobedience to the divine will, to erect temples and altars for the use of all his queens and concubines, dedicated to the respective deities whom they idolatrously worshipped." Pref. p. xvii.

There are, we believe, few translators or interpreters of scripture who would speak with equal *tenderness* of this voluptuous and dissolute monarch. Mindful of our character and our years, we have been long accustomed to call things by their right names; and have too much respect both for ourselves and for the generation that is to succeed us, to dignify wantonness and irreligion by the name of *generosity*. We will not dispute the monarch's generosity in building a superb palace for his queen; we cannot doubt of the warmth of his affection, nor of his sincerity and continuance of his kindness to the *Rose of Sharon*: but in forsaking the religious, which were at the same time the political institutions of his country, so far as to gratify his concubines by the introduction of idolatrous rites into his kingdom, we must think (what we have ever thought) that

he exhibits a melancholy and a warning instance of the inevitable tendency of sensual indulgence, to destroy all regard for moral distinctions, and all reverence for religious truth; and to hurry its unfortunate victim to the neglect even of worldly policy. The monarch of Israel was a man of ardent passions; under the guidance of which he violated the wisest injunctions of the great legislator of his people. To throw over his libertinism the splendid veil of *generosity*, was certainly not necessary for the translator's purpose, and ought to have been avoided as of evil tendency.

After perusing the passages we have selected, our readers may be anxious to know what Mr. Good thinks of the claim which the Song of Songs has to be considered as of canonical authority. When the book first came into our hands, our feelings were, we are persuaded, such as theirs will be. We opened it in the midst of the notes; we felt that we were still men, and we were warmed by the blaze of beauty that surrounded us. The amatory effusions of the Oriental and the Grecian muse that glow in every page, arrested our attention; and, though not surprized, we were for sometime captivated by the striking resemblance that prevails among the Persian, the Asiatic, and the European amorettes, and the love-song of the Hebrew monarch. It had long since appeared to us, that the Song of Songs had no right to a place in the sacred canon; though it might be very well placed upon the same shelf with Anacreon, Secundus, and other poets of the same temperament. The studied display of passages not only similar, but proved, or attempted to be proved, to have been borrowed by love-lorn bards from the "Sacred Idyls," justified the opinion we had already formed. Our surprize, therefore, was not small, when, upon adverting to the preface, we found the learned translator claiming for this poem the rank of an inspired production, as affording not only "the veil of a sublime and mystical allegory, delineating the bridal union subsisting between Jehovah and his pure and uncorrupted church; and an admirable picture of Jehovah's selection of Israel as a peculiar people, and of the call of the Gentiles: but also a happy example of the pleasures of holy and virtuous love, and inculcating, beyond the power of didactic poetry, the tenderness which the husband should mani-

fest for his wife, and the deference, modesty, and fidelity with which his affection should be returned; and considered even in this sense alone, fully entitled to the honor of constituting a part of the sacred scriptures." We are proud to discover in the sacred volume the model of all the correct morality, and the rational theology of the ancients: we receive the highest pleasure in tracing the sources, whence flowed all the good principles which the philosophers of antiquity imbibed, up to "Siloe's brook that flowed fast by the oracle of God;" but it is not without considerable pain, and even disgust, that we see the sacredness of divine inspiration attributed to a work which, according to its warmest

admirer, has suggested many passionate if not licentious thoughts, to the votaries of illicit love.

To sum up, in a few words, an opinion of the work before us: the arrangement is new and ingenious; the translation faithful and elegant; the poetical version is, for the most part, correct and beautiful; the notes are full of profound learning and good taste. It is a work which every scholar will peruse with pleasure; from which the divine may reap improvement; but notwithstanding all the "delicacy of diction" of which the translator boasts, it is a work which we would carefully guard from the eye of youthful modesty.

ART. III. *The United Gospel; or Ministry of our Lord and Saviour Jesus Christ, combined from the Narrations of the Four Evangelists.* By R. and M. WILLAN. *The third Edition, with many additional Notes and Observations.* 8vo. pp. 234.

THIS work, which has been several years before the public, and not without just reason favourably received, is designed "to exhibit the events of the gospel history in their proper order of succession;" not by bringing together the accounts of each evangelist, and placing them in parallel columns, but "by combining the accounts of the four histories, and relating every circumstance in their own words;" selected and arranged, so as to afford the fullest history of every transaction. In determining the order of the events, one evangelist is not uniformly preferred to another; but greater regard is paid to him who gives the fullest account of the different periods of our Lord's ministry.

On the subject of the duration of Christ's ministry, Dr. Willan agrees with the late Primate of Ireland in assigning to it a period of three years.

On the merits of this work, it is not our province to enlarge; it belongs to our plan only to announce the sanction which the public have expressed in calling for a third edition. We cannot however refrain from presenting our readers with a specimen of the notes which accompany this edition of the *United Gospel*; they are in general valuable, especially those which contain remarks connected with the author's profession. Mrs. Willan has also contributed to the information which this part of the work conveys.

Of the prevalence of the opinion re-

specting the agency of malicious spirits on the human body, among mankind, in all ages, and in all countries, Dr. Willan has collected the following curious evidence.

"The diseases thought, in Asia, to arise from dæmoniack possession, or to be otherwise inflicted by evil spirits, by the moon, planets, &c. were epilepsy, catalepsy, tetanus, hysterical and other convulsions, palsy, apoplexy, carus or lethargy, incubus, somnambulism, melancholy, mania and phrenzy, idiotism, loss of memory, sudden loss of voice, any singular deformity, and a wasting without apparent cause.

"Socrates and Plato, in Phæd. describe two species of mania; one arising from bodily disease, (*υπονοσηματων ανθρωπων*) the other, from a change of state effected by divine impulse, (*υπο θεας εξαλλαγης των αισθητων νομιμων γιγνομενη*) which he refers to Apollo, Bacchus, the Muses, Venus, and Eros or Cupid. Epilepsy was among the Greeks so generally referred to supernatural influence, that it was termed, even by their physicians, the 'sacred disease.' Hippocrates seems to have been the first who combated this opinion of his countrymen. He thinks the disease no more deserving the appellation of sacred than many others, as fever, ague, phrenzy, &c. After exposing the absurdity of those who pretend to decide from some variation of the symptoms in different cases, whether the fits were occasioned by Cybele, Neptune, Hecate enodia, Apollo nomius, Mars, or some of the heroes, he severely reprehends the exorcists of his time as impostors, affecting a degree of sanctity and wisdom inconsistent with the general tenor of their conduct, and pretending to set aside what more than human power had in-

flicted, by means of incantations, magic ceremonies, lustrations, and sometimes by the most contemptible juggling.—Comp. Acts xix, 13-19. He endeavours to point out the exciting causes of epilepsy, and to establish a rational method of cure for it, finally observing, that sheep, goats, &c. are often affected with it; and that in them the effect on the brain is, on dissection, found the same as in men to whom it had proved fatal. Hippoc. & Gal. de morbo sacr. Arist. probl. i.—Alex. Trall. i. 15.

“Aretæus, of Cappadocia, a celebrated physician, whose works were published about the same time as the gospels, speaks on this subject with candour and moderation. In describing the chronic species of epilepsy, ‘which neither the skill of the physician, nor any change of constitution through life can remove,’ he makes the following remarks:—‘The nature of this disease is not easily explained; some think it inflicted by the moon on offenders, whence they call it the sacred disease. However, it might have the denomination of sacred on other accounts, either from its magnitude, every thing great being deemed sacred, or because it could not be removed by human means, but only by divine power, or from the opinion that a demon had entered into the patient, or for all the reasons together.’—De Caus. Affect. lib. i. The same author, like Plato, refers mania, in some instances, to supernatural impulse. (ἐνθεος ἢ δὲ ἡ μανία)—Lib. i. cap. 6. He observes on tetanus, that it is a calamity out of the course of human nature, (ἐξ ἐνθεωματος ἢ συμφορῆς) and an incurable malady. Loc. cit.

“Oribasius and Aetius, Greek physicians of the fourth century, have made nearly the same observations. The former, referring to the opinion of daemoniacal influence in another disease, says, ‘the incubus is not an evil spirit, but should rather be considered as the prophet and minister of Æsculapius,’ because it often denotes the accession of epilepsy, apoplexy, or mania.—Synopsis, lib. viii. cap. 2. Aet. Tetr. ii. 2, 12.

“Succeeding writers have distinguished between epilepsy arising from physical causes, and the analogous disease referable to the operation of demons. Actuarius and Nicolaus Myrepsus, the last of the Greek physicians, mention specific antidotes for persons affected with demons and evil spirits.—Aet. Med. 5, 6. Myreps. de Antidot. 1, 2. It is to be noticed, that the more ancient physicians also called the remedies ‘sacred,’ (ἁγία) which they applied in the cure of the diseases above enumerated.

“The opinion of the Romans on demoniacal possession, may be easily understood. It is indeed manifest, from the various words in their language, as well as from their medical terms, e. g. ceritus, lymphaticus, larvatus, bacchatus, furiatus, lunaticus, syderatus, panicum, corybantismus, lues deificæ,

sacer ignis, &c.—See Plin. Hist. Nat. xxiv. 17. & xxxiv. 15; and Coel. Aurelian. de Morb. Cron. lib. i. cap. 4. 5. & de Morb. Acut. ii. 50.

“Among the Arabian physicians, John Serapion says, that ‘mania is a species of the demon.’ Epilepsy, he observes, has several names; among the rest, that of the divine or sacred disease, because it is referred to the operations of demons, whence it is injurious to the principal organs of the body.

“Avicenna (lib. ii. tr. ii. cap. 561) mentions, that in his time a certain Jew cured epileptic patients, and demoniacs, by some mode of fumigation. Though doubtful respecting the particular remedy employed, he does not question its efficacy in such cases.

“The following passages on this subject from Alsaharavius, (Pract. cap. 34) contains also the sentiments of an Arabian writer many years prior to him. ‘Of the symptoms of epilepsy caused by demons, I was always doubtful, till of late they were manifest to me. I saw the complaint under various forms; some patients suddenly fell senseless to the ground; changed countenance; spoke in foreign languages, with which they were not before acquainted; read, wrote, and treated of sciences which they had never learned; finally, when they recovered, these extraordinary powers were lost; and they returned as well to their natural complexion, as to their usual state of intellect. I was wholly ignorant of the causes of this malady before I had read the works of Hamen, the son of Isaac, who treats, among other pathological enquiries, of the diseases caused by the evil Ghin, or demons called Eblis. In the management of these disorders, if human genius be foiled, or unable to decide with certainty, leave all to the Creator, who will shew mercy on the works he hath framed. Physicians, through fear or want of information, are not forward in treating on this subject; however I have no doubt, but that the cure of such diseases is one of the ancient sciences which are, at this day, concealed from the knowledge of men.’

These curious quotations, we readily acknowledge, “fully prove that the opinion respecting the agency of malicious spirits, on the human body, has prevailed among mankind in all ages;” but that this opinion is confirmed either by the conduct or the words of the founder of christianity, is much more than we are prepared to own. Such an opinion, these quotations most clearly shew, have been the offspring of ignorance and superstition.

With the following short but very important remark upon Matt. xxvii. 63, we will conclude this article:

“This text, and some other similar passages, as Matt. xii. 40, where it is said,

'the son of man shall be three days and three nights in the heart of the earth,' have produced much cavilling among the enemies of christianity; since it appears that our Lord remained with the dead only from the eve of the Sabbath, to the morning after it. So heavy an objection need not rest on the shoulders of the churchmen, but should descend with all its weight on the medical profession; in which it has been usual, from Hippocrates to Galen, and from Galen to Sydenham, and onwards, to reckon days precisely in the same manner as the evangelists;

thus at whatever hour of the day or evening a fever commences, that day is called the first. If shiverings take place at six o'clock p. m. and the fever continues over the next day and night, but should have its crisis on the second morning at seven or eight o'clock, this fever would be denominated a fever of three days. Those who will not respect ancient medical authority and usage, must be referred on this, as on all other important points, to the learned and elaborate collections of Grotius, Hammond, Whitby, and Doddridge."

ART. IV. *The English Diatessaron; or the History of our Lord Jesus Christ, &c.*  
By the Rev. R. W. WARNER. 8vo. pp. 330.

IN the year 1800, was published by Dr. White, the celebrated Arabic professor of Oxford, a work under the title of Diatessaron, being a narrative, in Greek, of the history of our Saviour, compiled from the writings of the four evangelists. It is divided into parts or periods, and is furnished with useful marginal indications of the time and place of the events and discourses which are recorded. That hypothesis respecting our Lord's ministry is here adopted, which assigns to it a duration of three years and a half. This work of Dr. White, Mr. Warner here presents to the public in an English dress, using the words of the common authorised version. The utility of the general design is obvious. In adapting the different narratives to each other, and to chronological computation, some room is left for the exercise of judgment, and perhaps, after all that has been said and written upon the subject, of controversy. In this part of the work, Mr. Warner, however, assumes only the office of an editor; the system rests with the original author. We should have thought it a more desirable plan, if no part of the original had been omitted, but the most circumstantial narratives placed in the text, and

parallel passages of the other evangelists, inserted in the form of notes. In one circumstance of technical arrangement, in which Mr. Warner has departed from Dr. White, he has rendered his work rather less convenient: the chronological and topographical remarks are placed only at the beginning of the sections; the parts also are numbered only at the commencement of each, while, in the Greek edition, these notices occur in every page.

To the narrative, Mr. Warner has subjoined notes, intended to be explanatory and illustrative of the text to common readers, which are usually selected with judgment. — Into original criticism he rarely deviates, and cautiously abstains from topics of theological controversy. His liberality, however, appears in the sources of his information: he has not disdained to borrow aid from those who are usually termed heretics; nor, what is still more to his credit, to pay them the tribute of praise which is justly due, at least in many instances, to their sagacity, learning, and love of truth, even from those who dissent most widely from the opinions which they have seen it their duty to maintain.

### SACRED CRITICISM.

ART. V. *Notes on the Bible: by the late Rev. CHARLES BULKLEY. Published from the Author's Manuscript; with Memoirs of the Author and his Works, by JOSHUA TOULMIN, D. D.* 3 vols. 8vo. pp. 685, 502, and 489.

THE author of this work has been long known to the public, as an ingenious and learned writer upon subjects of considerable importance. From a well written memoir of his life, prefixed to the third volume, we learn that he was descended from the pious Henrys, and that he received his academical education

under the excellent Doddridge: a name of which the protestant dissenters will never cease to boast; which learning and piety will never cease to honour. Soon after he left Northampton, he appears to have joined himself to the general baptists; and for a long series of years he continued the labours of a

Christian minister, with ability and success, in the service of a congregation in Barbican, London, afterwards removed to Worship-street. He died in April 1797, in the 78th year of his age.

The work which is now presented to the public, was, we are told, a favourite production with the author himself. During his life he was very desirous that it should be published; and for this purpose, about the year 1792, caused proposals to be printed and circulated. "But though," says the editor, "his particular friends generously came forward to countenance the design, the names amounted only to about half the number which was requisite for putting it to the press." Finding so little encouragement, he relinquished his design, and, towards the close of his life, bequeathed the work to his sister: "hoping that, at least, she would not suffer it utterly to perish, even though it should not be able to go abroad." A bookseller, whose generosity Cowper has celebrated, and others of less name have frequently experienced, having taken upon himself the charge and risk of publishing the work, and the present editor having engaged to conduct it through the press, it is now presented to the public, and will, we doubt not, be esteemed as a valuable addition to English biblical literature.

The character which Dr. Toulmin has drawn of this posthumous publication, is full and accurate. In his own words we shall lay before the reader the remarks in which we are anticipated.

"It does not offer notes on every passage, or on connected paragraphs, but proposes illustrations of particular verses, drawn from all kinds of writers, in a long course of reading. The quotations, of which it consists, tend to illustrate the portions of scripture, under which they appear, by parallelism of sentiment and language, or by explanations of allusions or customs, or by remarks on grammatical idioms and anomalies, or by hints of other kinds. They are borrowed from a great variety of authors, Heathen, Jewish, and Christian, ancient and modern. In this mode of commenting, Mr. Bulkley has been preceded by Grotius, Raphelius, Westein, and many learned foreigners: and at home, Doddridge, Chandler, Bishop Pearce, and Wakefield, have furnished specimens of it. But this work, considering the fulness and extent to which the plan of it is pursued, may, I conceive, be considered as an *unique* in the English language.

"It promises, therefore, to be acceptable to the biblical student, and will supply the

young preacher with many fine passages, from the stores of Greek and Latin erudition, with which to illustrate his representations of devotional and ethical truths derived from the Old and New Testament. It may also be expected, to procure from some fastidious and sceptical critics respect to the scriptures, when they find them abounding with sentiments, language, and modes of expression, similar to those which have been admired in Grecian and Roman classics: but the propriety and beauty of which, because they present themselves in the scriptures, they are apt to overlook. No reader can lay down the work, after inspection of it, without a deep conviction, that the religious and moral truths, which are contained in the scriptures, are congenial to the human mind in its most pure and improved state: and the irreligious and those who are indifferent to divine truth may blush, when they observe how a Plato, a Maximus Tyrius, an Epicetetus, a Cicero, and a Seneca, spoke on topics of a religious and moral nature."

As affording a fair specimen of the plan upon which this work is conducted, we select the following passages.

"Proverbs, Ch. xxii. v. 6. Train up a child in the way he should go: and when he is old, he will not depart from it.

"In life, says Demophilus, (suppose it to be a drama) youth sustains the first act; to which therefore all are particularly attentive. *Τα βίη, καθάπερ δρᾶματος, πρῶτον μέρος ἐστὶν ἡ νεότης· διὸ πάντες αὐτῇ προσέχουσιν.* Holstein. p. 28.

"So again; It is in youth, as in plants, the first disposition shews that fruits in virtue may be expected. *Ὁν τροπῶν ἐπὶ τῶν φύλων, καὶ ἐπὶ τῶν ψυχῶν ἡ πρώτη φύσις προδεικνύσκει τὸν μελλόντα καρπὸν τῆς ἀρετῆς.* P. 30.

"We have it observed in Plato, that opinions formed in youth are with greatest difficulty eradicated. *Αἱ ἀληθείας ὡς (νεὸς scil.) λαβὴν ἐν ταῖς δοξαῖς, δυσκινῶνται τε καὶ ἀμετάσχετα φιλεῖ γιγνεσθαι.* De Repub. lib. ii. tom. i. p. 142. Massey.

*Τὰ μὲν — κηρύσσον — εὐδὺς ἐκ παιδῶν, τοῖς θεοῖς τε τιμητῶσι καὶ γονεῦσι, τὴν τε ἀλλήλων φιλίαν μὴ περὶ σμικρὰ ποιησόμενοις.* Ibid. lib. ii. ad init.

"Such are the instructions to be given at the earliest period to children, if we wish to see them honouring the gods and their parents, or cultivating mutual friendship and love.

*Τὰ παιδῶν μαθημὰτα θάυμαστον ἔχει τι μνημειον.* Platon. Timæ. Op. p. 476.

"The instructions given in earliest age are wonderfully lasting and impressive.

— — — Nunc adhibe puro Pectore verba, puer, nunc te melioribus offer, Quo semel est imbuta recens, servabit odorem Testa diu.

Horat. epist. ii. lib. i. ver. 67—69.

"Now young man, apply your mind to

(sound and wholesome) words and addict yourself to the best instructions: for I can assure you that the vessel will long retain the scent, which, when new, it had imbibed.

— Parvosque docent procumbere natos.

Thebaid. lib. x.

“And teach their little children to adore.

“See Stockton on Family Instruction, chap. iv. § 22. p. 287, 288.

“Compare I Sam. viii. 9.

“V. 13. The slothful man saith, There is a lion without, I shall be slain in the streets.

“See chap. xxvi. 13.

“V. 19—21. That thy trust may be in the Lord, I have made known to thee, this day, even to thee, &c.

“Vide Luke i. 1—4. 1 Pet. iii. 15.”

“Matthew, Ch. vi. v. 14. For if ye forgive men their trespasses, your heavenly Father will also forgive you.

“Aristotle, Rhetor. lib. i. cap. ix. § 41. lays it down as a rule, that a man then honours his noble birth, when in proportion to the greatness of his extraction, he is so much the more placable (καταλλακτικώτερος) in his disposition.

“And ib. cap. xiv. § 21. almost in the very words of this and the following verse, makes it a point of virtue, to exercise forgiveness towards humanity.

“Isocrates, Panegy. ed. Op. Steph. p. 49. makes it to be one object of the celebrated Grecian games, to abolish enmities. Ως—  
τας εχθρας—διαλυσαμεν—

“Cicero, in his Oration pro Ligario, speaks of it to the praise of Cæsar, that he forgot nothing but injuries: Nihil oblivisci soles, nisi injurias. And though we should look upon this to be mere flattery and compliment, yet it does not at all the less signify, that forgiveness of injuries was held both by Cicero and Cæsar, to be a very commendable and honourable quality.

“Epictetus, lib. ii. cap. x. p. 196. supposing one to ask, May I not hurt him that has injured me? advises him, in the first place, to ask himself, whether he has really received any injury or not, and to remember what the philosophers say upon this head; and then again, to ask the question, Did not this man hurt himself by injuring me? How then am I like to fare by returning it? Εγω εμαυτον μη βλαψω; And ibid. cap. xxii. he makes it a requisite property in one that would cultivate friendship with mankind, that he should be of a forgiving temper, Συγγνωμονικος.

“Maximus Tyrius, has a whole dissertation (ii.) against the revenging of injuries, and says, that he who does so, is guilty of a greater crime than the first aggressor (78

προυπαρξεν) αδικησας), and that the allowing injuries to be returned opens a door to endless quarrels and animosities, illustrating the observation by a variety of historical facts.

“In Dion Cassius, lib. lxxi. p. 812. ed. Hanov. the emperor Antoninus, is made to speak of the forgiving injury, and the retaining friendship towards one who had violated the laws of friendship, as a conqueror's greatest reward; and if, says he, this should be thought incredible, let it be known that there are some remains of ancient virtue (αρχαϊας αρετης) amongst us.

“Ælian, in his Various History. lib. xii. cap. xlix. relates the story of Phocion, who, after having long served his country, was adjudged to death; and when about to drink off the fatal cup, being asked by his surrounding friends, whether he had any thing to leave in charge to his son, Only this, says he, that he would not revenge upon the Athenians this injury done me. The historian adds, by way of remark; He that does not look upon this man with admiration, (οτις οκ επαινει, &c.) appears to me to be a man of no sense or discernment whatsoever; agreeably to the observation of Andronicus Rhodius, in his Paraphrase upon the Ethics of Aristotle, lib. iv. cap. v. p. 105. ed. Cantab. that to forget and overlook injuries, is the mark of a noble and a magnanimous mind, μεγαλοψυχη.”

It will appear from these citations, and from every page of the work, that the writings of the ancient heathens were not destitute of excellent moral sentiments: and there is indeed scarcely a precept in the gospel, to which a similar precept may not be found in the philosophical relics of Greece and Rome. But the learned reader well knows that these excellencies occur in the midst of the most striking and lamentable defects, and that these truths, so impressive in their detached state, are almost lost in the error and absurdity by which they are surrounded. The dictates of Christian morality appear in far different circumstances: in the scriptures of the New Testament there is no polluting mixture of erroneous sentiment; every maxim is founded upon reason and truth; no injunction is weakened by some neighbouring inconsistency; the principles upon which the conduct is directed to proceed are the most efficacious that can be formed; and the sanctions by which virtue is encouraged and vice restrained, the most powerful that can be announced.

ART. VI. *Observations upon some Passages in Scripture, which the Enemies to Religion have thought most obnoxious, and attended with difficulties not to be surmounted.* By JACOB BRYANT. 4to. pp. 256.

"IN the Treatises," observes the venerable author, "which immediately follow, I have taken in hand to consider and explain four particular Histories in the Sacred Writings, which have been esteemed by unbelievers the most exceptionable of any upon record. In consequence of this they have afforded room for much obloquy, and ridicule, which has arisen partly from the ignorance of such persons, in respect to the true purport of these narratives; and partly from their being unhappily disaffected towards the Scriptures in general. The first article, in the explanation of which I shall be engaged, is the account of Balaam, who was reproved by the animal upon which he rode: and this is said to have been effected by a human voice, and a verbal articulation given to a brute beast. The second article relates to Samson, who is described as defeating a host of Philistines with the jaw-bone of the same animal, an ass: the whole of which history is by many thought to be an idle detail. The third History, of which I shall take notice, is of the sun and moon, which are said to have stood still at the command of Joshua. The fourth, and last, is the History of the Prophet Jonah; and particularly of his being entombed in the body of a large fish, which is supposed to have been a whale."

The principle upon which Mr. Bryant proceeds in his attempt to explain the two first and the last of these portions of scripture, is that upon which he laboured to illustrate the miracles which Moses performed in Egypt. He considers the miracles recorded in scripture as generally pointed and significant; not only shewing marks of supernatural power, but having a uniform reference to the persons concerned, and to their history and religion; adapted to people who are at any time to suffer, and to those who are to be admonished by their punishment. (p. 3.)

The transaction which is recorded in the Book of Numbers, he does not consider, with Geddes, as a legendary tale; nor with Jortin, as in part visionary: he firmly believes in its perfect reality, and endeavours to shew that it was designed to bring contempt upon an object of idolatrous worship, and to demonstrate the superior power of the God of the Israelites. —Balaam was a priest of Midian, and dwelt at Pether, called by the Grecians Petra, where a city and an oracular temple had been founded, in which he ap-

pears to have been chief priest. In this oracular temple, the OnolatRIA, or worship of the ass, prevailed; a worship, according to ancient testimony, very general both in Egypt and in Asia, and of which both the Jews and the Christians were accused. This respect paid to the wild ass, arose from their sagacity in discovering springs of water in the dry and parched deserts. "They were revered for their superior forecast, and admitted as emblems of divination." p. 26. Balaam, the high priest in the oracular temple in which this deity presided, was hired by the king of Moab, to curse the children of Israel. Being of an obdurate heart, of a most obstinate and inflexible disposition, he sets out, determined, notwithstanding the repeated order of God to pronounce nothing but blessings, to vent nothing but curses. In his progress, the ass on which he rides rebukes him, and indicated most plainly that the omens and prodigies to which he had been habituated and devoted, and also his own God, declared against his process. Arrived in Moab, he is compelled by a power which he could not resist, to pronounce a series of wonderful prophecies to the confusion of Balak, and in favour of the people of God. The idolaters were thus taught that the oracles to which they trusted, and the deities on which they relied, were vanity; and the children of Israel were led to worship *Him* only, before whom those deities were humbled, and to whose power even their priests bore witness.

The same mysterious meaning lurks in the history of Samson, when he defeated the Philistines at Lehi, or Lechi, with the jaw-bone of an ass. The Philistines were holding a festival in honour of their deity, who was delivering their great enemy into their hands. In this festival they had sacrificed an ass, and one of the jaw-bones was lying on the spot, to which Samson was conducted: bursting asunder his bonds, and seizing this bone, he slew with it a thousand men. When this feat was accomplished, he threw away the jaw-bone, not because he had no further use for it, but to signify that the place was an object of hatred and abomination, and to instruct the children of Israel, that they

ought not to apply to the temple or fountain at Lechi, upon any occasion, nor to the deity there worshipped; but to a superior power the God of their fathers. This formidable weapon not only belonged to the animal they had been employing in their sacred rites, but had actually given name to the sacred fountain, which was there dedicated to the wild ass, and near which there was an oracular temple. Nothing, therefore, Mr. Bryant concludes, was more proper to shew the superiority of the God of Israel over the deities of Canaan, and to prevent any undue reverence among the descendants of Abraham, than the miracle performed by the Jewish hero.

It will, however, appear to our readers, as it appeared to us, a very extraordinary and incredible thing, that the Philistines should sacrifice, in honour of their deity, the very animal which, as a symbol of that deity, they revered.

Mr. Bryant thinks it "idle to object to the account in Scripture of Samson and the Foxes, as there could not be a more effectual method to hurt the enemy; for the foxes, drawing different ways, were undoubtedly impeded in their course, which must have given time for the fire to take effect. The story, in his opinion, is confirmed by the practice which prevailed in Rome, of exhibiting every year foxes and firebrands in the circus.

With respect to the third passage selected from the Xth ch. of the book of Joshua, and relating to the command of Joshua that the sun and moon should stand still, Mr. B. proceeds upon the same general principle of interpretation; but, with more boldness than he usually displays, pronounces a part of the history an interpolation. The 13th and 14th verses, he asserts, were originally a marginal note, and afterwards ignorantly taken into the text. The 12th verse, supported by Aquila and Symmachus, he renders thus, "Then spake Joshua to the Lord, in the day when the Lord delivered up the Amorites before the children of Israel: sun, upon (the high place of) Gibeon, be silent; and thou moon, in the valley of Ajalon." And he remarks,

"The words of Joshua are undoubtedly uttered in the name of God, and not addressed to the two fictitious luminaries, except in a secondary direction; and were probably a wish, and prayer, rather than a command. They proceeded from an ardent zeal to esta-

lish the worship and true religion of the Deity, and from a grateful sense of his goodness in affording such a miraculous victory. The purport and ultimate design of this address, though couched in a small compass, seems to be this: God of all victory, may thy people, from this instance of thy superiority, be confirmed in their duty, and worship thee alone. And may the Gibeonites, and their confederates, by this display of thy power, be weaned from their idolatry, and see the inferiority of their base deities. May the Sun, whose oracular temple stands upon Mount Gibeon, be dumb; and the Moon, whose shrine is in the valley of Aia-lon, be equally silent. May their oracles cease for ever."

The inhabitants of Gibeon had seen the object of their worship obscured by the miraculous storm of hail that destroyed their enemies, and were therefore prepared, according to the pious wish of the Jewish chief, to renounce their idolatry. The children of Israel received another proof of the supreme power of the true God, and were again warned not to forsake his service. In a note printed at the end of the volume, Mr. Bryant shews, that Gibeon was, in the days of Solomon, devoted to the worship of Jehovah; and he thence concludes, that the inhabitants became proselytes upon the event recorded in the passage he has thus interpreted.

Upon the same principles Mr. Bryant endeavours to account for the prodigy of Jonah's being swallowed by a whale, the account of which we are peremptorily told, (p. 200.) that "whoever is a sincere Christian ought, without any evasion, to believe." Jonah was a native of Galilee, and "one of the number of those who were unsettled in their principles, as Balaam had been before, and Judas was afterwards." Gath Heper, the place of his birth, was inhabited by "different people, who were either the remains of the ancient inhabitants, the Canaanites, or were a mixed race from Tyre, Hamath, and the cities of Syria, who had forced themselves into the country, and had brought their rites and religion with them." To these rites Jonah was devoted; and was even a prophet and a priest among the worshippers of the dove and the Cetus.—Hence he derived his name—the term *Jonah*, or *dove*, denoting a priest. Of the nature of the true God he was ignorant: he was his servant, only as being the most proper instrument to display his power. Not choosing to go as he was

directed to Nineveh, he fled to Joppa; and there put himself under the protection of the deities that were worshipped there, amongst which the whale or cetus held the principal rank. From Joppa, under the sanction of this deity, he intended to shelter himself from the eye of Providence, in Tarsbush, or Tartessus; but a storm arising, as he was crossing the Mediterranean, he, according to the well-known relation, was thrown overboard, and instantly swallowed by that very fish—which had been the object of his reverence. Three days afterwards “the cetus was stranded, and within view of the temple of Derceto, and in sight of its numerous votaries, disgorged the apostate prophet.” The mariners, upon their return, recounted the surprising tale of what had passed on board, and in the ocean. The inhabi-

tants could not fail to receive a salutary lesson. The goddess they adored, the supposed empress of the seas, was disgraced: her votary had been entombed in the body of the animal that served as a symbol of her divinity; and the God of the Hebrews had displayed his power over their idol deities, and their infatuated worshippers. As a confirmation of this story, Mr. Bryant refers to the bones of a sea animal, which Pomponius Mela says, were preserved at Joppa; which Pliny informs us, were brought as a curiosity to Rome; and which Mr. Bryant concludes could be none else than the bones of the very whale that carried the prophet in its belly.

Of the truth and the importance of these disquisitions, we leave our readers to judge.

ART. VII. *The Divine Inspiration of the Jewish Scriptures, or Old Testament, asserted by St. Paul, 2 Tim. iii. 16.; and Dr. Geddes's Reasons against this Sense of his Words examined.* By ROBERT FINDLAY, D. D. Professor of Theology in the University of Glasgow. 8vo. pp. 104.

THERE are some passages of scripture which have exercised the critical skill of learned theologians, from a very early period of the Christian church to the present day, and which we apprehend will continue to divide the sentiments of interpreters till the end of time. The passage which forms the subject of the work before us, is one of this number. Of doubtful meaning as to the terms which are employed, and the collocation of those terms, it will be explained, with greater or less latitude, according to the opinions which have been previously formed respecting the general system of the Christian faith. Let not the unbeliever conclude, that any injurious reflection concerning the authority of scripture, may from such instances be fairly drawn. Were some of the most celebrated works of profane antiquity to be brought into one canonical collection, and profession of faith in the facts or dogmas which this collection would contain, connected with the prejudices, the feelings, and the interests of men, as those of the sacred canon now are, in the place of one difficulty that now arises, thousands would spring up. Controversies without end would occupy the labours, and influence the passions of polemic; and the *odium theologicum*, the constant object of the sceptic's ridicule, and of the real christian's sorrow, would

be mild and harmless in comparison, of the infuriate and implacable zeal which would fire the breasts of embattled controversialists. Of no such degrading spirit does the work before us afford the faintest specimen, or encouragement. As a critic, and as a christian, Dr. Findlay claims our reverence and our applause.

Dr. Geddes, in the preface to the 2d Vol. of his *Translations of the Bible*, with great honesty, but with little caution or prudence, avowed his disbelief of the inspiration of the books of the Old Testament, in terms that could not fail of proving highly offensive to the generality of Christians. The well-known passage in the 2d epistle of Paul to Timothy, seeming to present a strong objection to his decision, he professes to examine it with particular attention.—The result of his examination is, *that the present reading is not genuine.*

The arguments upon which this result was formed, are: “the copulative *xxi*, which alone makes for the present reading, is wanting in all the ancient versions except the Ethiopic; also, in some Greek copies still extant. It was not read by Clement of Alexandria, Theodorus of Mopsuesta, nor by the Latin fathers Tertullian, Cassiodorus, and the anonymous authors of two treatises ascribed to Cyprian and Ambrose; all of

whom seem to have quoted from the Italic version. The construction, as it now stands, is awkward and ungrammatical; even if *εἰ* were inserted between *γραφή* and *Θεοπνευστος* it would make the apostle write an absurdity; for the whole body of scripture is never expressed, or alluded to, without the article; either *αἱ γραφαί* or *ἡ γραφή*."

These arguments Dr. Findlay very fully and very candidly examines.

He allows that the copulative *καί* is wanting in all the ancient versions except the Æthiopic, and that there is no indication in these versions that it existed in their Greek copy; but it cannot hence, he thinks, be argued, that it was not really in the Greek copies that they used, since translators and interpreters are known, and generally allowed to use great liberty with such small particles, sometimes omitting and sometimes interpolating them. Dr. Findlay also acknowledges that Dr. Geddes is accurate with respect to Cyprian, Cassiodorus, Ambrose, and Theodorus; but he contends that Clement and Tertullian cannot be proved not to have read *καί*: and that it is not clear that the Latin fathers did all follow the same Latin translation as their guide. Of the Greek copies, only one is found to want the article, and that is comparatively of a recent date, and of no authority. The Christian fathers, who have written Greek commentaries, ought not, Dr. Findlay owns, to decide; yet it is worthy of remark, that Theodoret, Chrysostom, and others, have manifestly read *καί*. Concerning the proper position of the word *εἰ*, he observes, that there are several instances where it is introduced with unquestionable propriety by our translators, before the first of two adjectives, between which the same particle *καί* intervenes, as here. Two passages occur in the former epistle to Tim. ii. 3. and iv. 4. The omission of the causal particle *γὰρ*, the professor shews to be much in the apostle's manner; and that *γραφή* without the article may properly denote the Jewish scriptures: he argues from the apostle's mention of them in the preceding verse; from the occurrence of the term in other passages, in which it evidently bears that sense, particularly 2 Pet. i. 20, 21, and John xix, 37.; from the authority of Josephus; and from the use of many words in the Greek language, such as *νόμος*, *λόγος*, &c. without the article. Dr.

Findlay then adds some observations to prove that *καί* ought not to be rendered *also*, and that the construction which others besides Dr. Geddes would give the words, making *Θεοπνευστος* not a part of the subject of St. Paul's position but the predicate, is neither natural nor just. He then proceeds to shew more fully, that the Greek fathers and commentators agree, in giving to the passage the sense which is commonly ascribed to it; and that the majority of later interpreters are of the same opinion. The doctor then advances one step further, and maintains that if it were allowed that the ancient copies did not read *καί*, they might nevertheless bear the meaning which is usually ascribed to the passage; and that there is reason to believe they were so understood by the fathers of the Latin or western church, and by the Syriac writers Ephrem and Ebed-jesu. He concludes the whole with some arguments to prove that *πᾶς* should be here explained in the collective, not in the distributive sense.

Such is the substance of the little work which is here presented to the world, by a scholar, a gentleman, and a christian. Though not in every instance convinced by the author's reasoning, we have received from it much satisfaction, and we regret that he who was the cause of its being produced, is far from the reach of the professor's arguments, and alike incapable of acknowledging their validity, or attempting their refutation.

As we were examining this tract, a few observations occurred to us, which we shall beg leave here to state. It is true, that neither Clement nor Tertullian can be proved to have had *καί* in their copies of the Greek Testament, neither can it be conjectured from the passages produced from their writings, that it was inserted in them. To us, they appear to determine little. It is, however, worthy of remark, that by both these fathers, the divine inspiration of the scriptures seems to be drawn as a consequence of their utility; and so to throw some light upon the position of *εἰ*. We understand Clement as saying: "The Scriptures composed of these holy letters, he (Paul) calls divinely inspired, *because* they are profitable; *ωφελίμους εἶναι*"; and the Latin interpreter appears to have understood these words in the same sense, when he rendered them, "*ut quæ sint utiles.*"

So also Tertullian: "*legimus omnem scripturam edificationi habilem divinitus inspirari*;" which seems to us no other than the converse of the proposition, *πασα γραφή θεοπνευστος ἐστὶ ὠφέλιμος*. This passage is misquoted by Dr. F. It occurs not in the treatise "*de Cultu Fæminarum*," but in that entitled, "*de habitu muliebri*." Cap. iii. In the treatise to which Dr. Findlay has erroneously referred, there is a passage which seems to have, at least, a remote allusion to the text before us: "*Nulla annunciatio spiritus sancti, ad presentum tantum materiam et non ad omnem utilitatis occasionem dirigi, et suscipi potest*." Edit. Heins. p. 165.

Though we do not deny that *γραφή* may mean in some passages, the whole Jewish canon, we do not think that in all the instances which our author has quoted, it has necessarily that extensive import. The term in John xix. 37, in our opinion, signifies nothing more than *passage*, "*locus unus e libro quodam sacro Judæorum; dictum scripturæ sacræ*." Vide

Schleusner in verb. The adjective *ἵσα* most clearly demonstrates that its signification must here be restricted. Nor is the instance from Josephus, *Antiq. Lib. iii. c. 1.* more satisfactory. The word may be considered as signifying no more than the Pentateuch, or even that particular book of the Pentateuch which contained the history of the miracle cited by the historian.

But we do not mean, nor is it our province, to examine every position in the work before us. The candid and ingenious examiner, will perhaps think with us, that some of Dr. Geddes's arguments are here ably controverted; that Dr. Findlay has not succeeded in all his positions; that if the present reading be retained, *θεοπνευστος* must have a meaning different from that which is usually assigned to it; and that divine inspiration cannot be proved to belong to every part of the Jewish canon, from a text of such dubious import.

**ART. VIII.** *An Illustration of the Hypothesis proposed in the Dissertation on the Origin and Composition of our Three first Canonical Gospels. With a Preface and an Appendix, containing Miscellaneous Matters. The Whole being a Rejoinder to the anonymous Author of the Remarks on Michaelis and his Commentator. By HERBERT MARSH, B. D. F.R.S. Fellow of St. John's College, Cambridge. 8vo.*

THE hypothesis proposed in the dissertation, and here most strenuously and ably vindicated, we cannot but consider as now so firmly established, that any further attempts to overthrow it, must be as unsuccessful as those of the author of the Remarks. There may be many who from want of time, or of inclination, have not made themselves acquainted with this curious subject of inquiry; we cannot, therefore, as it appears to us, perform a service more acceptable, than the devoting of a few of our columns to an abridged view of this interesting discovery. And that we may be in less danger of mis-representing, we shall, for the most part, employ Mr. Marsh's words.

Whoever has read a Greek Harmony of the Gospels, must have been struck by the remarkable similarity which prevails throughout the three first Evangelists, who agree not only in relating the same things in the same manner, but likewise in the same words. This extraordinary agreement could not be found between three historians, who had not some connexion with each other, either mediate or immediate. "For even eye-witnesses to the same facts, if they make their reports independently of each other,

will never relate them in the same manner, and still less in the same words."—The verbal harmony of the three first Evangelists, is therefore inexplicable on any other than one of two suppositions, either that St. Matthew, St. Mark, and St. Luke copied the one from the other, or that all three drew from a common source. Of these the former has been generally maintained, and it resolves itself into six possible cases; four of which have been adopted by different harmonists.

1. Matthew copied from Mark, and Luke from both.
2. Matthew copied from Luke, and Mark from both.
3. Mark copied from Matthew, and Luke from both.
4. Mark copied from Luke, and Matthew from both.
5. Luke copied from Matthew, and Mark from both.
6. Luke copied from Mark, and Matthew from both.

The fourth and the sixth cases have been used by no writer: The *first*, has been partly assumed by Storck. The *second* has been assumed by Busching. The *third*, by Grætius, Mill, Wetstein, Town-

son, and either wholly or in part by many other theologians. The *fifth* by Owen and Griesbach.

None of these hypotheses is, however, sufficient to account for all the phenomena which are observable in the three first gospels, nor exempt from serious objections. For this reason other critics have endeavoured to explain the verbal harmony that prevails in our three first gospels, on the supposition that they were derived from a common source.

The first writer to whom this thought occurred (unless indeed the phrase *αὐτὴ ἡ πηγὴ* of Epiphanius, which he has not explained, denotes the same) was Le Clerc, *Hist. Ecclesiastica* (Amst. 4to. 1716.) p. 429. : but he appears to have made no further use of his opinion ; and though it was delivered in very remarkable words, it attracted no attention and lay dormant upwards of sixty years. Michaelis revived it in the third edition of his *Introduction to the New Testament*, published in 1777, still retaining the opinion that Mark copied from Matthew. In the same year, Priestley published a similar thought in his *Observations on the Harmony of the Evangelists*. In 1782, Professor Koppe, at Gottingen, published a short Latin Dissertation, in which he explained the examples of verbal harmony, in the three first gospels, on the supposition that in those examples the Evangelists retained the words which had been used in more ancient gospels, such as those of which Luke speaks in his preface. He denied that one Evangelist copied from another ; and Michaelis afterwards did the same, adopting the supposition that the document or documents were Greek. Semler, in his remarks on Townson, published in 1783, was the first who delivered to the public, in a very cursory and indeterminate manner indeed, the hypothesis of a common Hebrew or Syriac document or documents, from which the principal materials of the three first gospels were derived. In 1784, Lessing's *Theological Reliques* were published, in which is a short essay, written five years before Semler produced his remarks ; and asserting with more precision the hypothesis of a common Syriac or Chaldee original, known to the ancients by the name of the Gospel according to the Hebrews, or the twelve apostles. Lessing was opposed, in 1786, by Storr ; and, in 1789, by Griesbach. — But in 1790, Riemer, professor of divinity in Halle, not only adopted Les-

sing's Hypothesis, but improved it, and laid the foundation of the still greater improvements which it has since received. In the year 1793, the theological faculty at Gottingen, proposed the question concerning the origin of the three first gospels, for a prize dissertation. Halfeld and Russwurm, both students in that university, and who had attended Eichhorn's lectures, were candidates. Both adopted the hypothesis of a common Hebrew or Chaldee document or documents ; but Halfeld, to whom the prize was adjudged, supposed that several documents were used by the Evangelists, whereas Russwurm maintained that they used only different copies of one and the same document which he calls the original gospel, and which he did not consider either as the gospel according to the Hebrews, or written by St. Matthew. During the time that the dissertations were preparing for the prize, Eichhorn was likewise composing a dissertation on the same subject, and in the year 1794 he published it, in the 5th vol. of his very valuable periodical work, "*The Universal Library of Biblical Literature.*" This is by far the most important essay which appeared in defence of the hypothesis of a common Hebrew or Chaldee original, previous to that by Mr. Marsh. Eichhorn supposes, as Niemeyer had done, that only one document was used by all three Evangelists, but that various additions had been made in various copies of it ; and that three different copies, thus variously enriched, were respectively used by our three first Evangelists. He proceeded further, and having analysed the three first gospels, he discovered *forty-two* sections, or facts, common to the three, which contains a short but well-connected representation of the principal transactions in the life of Christ from his baptism to his death, and such as might be expected in the first sketch of a narrative of our Lord's ministry. But these forty-two sections, which are to be found in our three first Evangelists, are not treated by each with equal diffuseness ; for sometimes circumstances are mentioned by two of them, which are not noticed by the third ; and each frequently introduces circumstances which are unnoticed by the other two. To the original text, therefore, of the common document, which in its primitive state contained only so much matter of the forty-two sections as is common to all the three Evangelists, various additions

were made in the several transcripts which were taken of it, and these additions may have been added in the copy used by the Evangelist, or by the Evangelist himself. With respect to the language in which the original document was written, he is decidedly of opinion that it was Hebrew or Chaldee. A third class of critics have united both these hypotheses: Bolten, at Altona, in the year 1792, and Herder, at Riga, in 1797. Bolten supposed that the Hebrew gospel of Matthew was the groundwork of our three first gospels: Herder, that the common document was oral. They both agree, amongst many points of difference, in maintaining that the Evangelists had recourse to each other's gospel in composing their own.

But not one of the hypotheses which had been hitherto framed, was sufficient of itself to account for all the phenomena that occur in the three first gospels. The supposition that the succeeding Evangelists copied from the preceding, even if it accounts for the matter which is common to all the three Evangelists, and for the example of verbal agreement, does not account either for the important matter which one Evangelist has less than another; or for the examples of apparent disagreement; or for the examples in which the same thing is related in different, but synonymous, terms. On the other hand, if we reject the supposition that the succeeding Evangelists copied from the preceding, and suppose that our three first Greek gospels were derived from the same Greek document; this hypothesis, even if it accounts both for the matter which the Evangelists have in common with each other, and for the matter which they have not in common with each other, and also for the examples of verbal agreement; still leaves the numerous examples, in which the Evangelists relate the same things in different but synonymous terms, wholly unexplained. Further, if we adopt the hypothesis that our three first Greek gospels contain three independent translations of the same *Hebrew* or *Chaldee* original, however well we may be able to explain the other phenomena, we shall never be able to account for the numerous and long examples, in which sometimes St. Matthew and St. Mark, at other times St. Matthew and St. Luke, agree word for word. And if, in order to account for their verbal agreement, we suppose that the Evangelists used

their common document, not in its original language, but only in a Greek translation; we shall be at a loss to explain their frequent use, at other times, not of the same, but of synonymous expressions. Lastly, if we combine the hypothesis, that the Evangelists used a common Hebrew document, with the hypothesis, that they had recourse likewise the one to the writings of the other, we shall find that several phenomena, which are explicable by the former hypothesis alone, are rendered inexplicable by its junction with the latter.

Such was the state of the controversy, when Mr. Marsh, as he informs us, sat down not to write, but to read; he examined all that had been written on every side, and found no opinion that had been delivered tenable; he determined therefore to try whether new data might not be discovered, which might lead to something determinate. With this view he formed a Greek harmony of the three first gospels, divided into classes, and containing only such parallel passages as are delivered in the same, or nearly the same words. Having formed this table, the next step was to analyse it; and the result was the discovery of many very remarkable phenomena in the verbal harmony of the gospels, which till that time were totally unknown.

He found, as Eichhorn had, that there were forty-two general sections contained in all the Evangelists; that in these there are several examples, in which all the three gospels verbally coincide; but only for two or three sentences together; that there are many very long and very remarkable instances of verbal agreement between Matthew and Mark, but only when the sections occupy the same place in each gospel; that Mark invariably agrees with Matthew, where Luke agrees also with Matthew. He likewise found, that in these general sections there are frequent instances of verbal agreement between Mark and Luke, though the instances of disagreement are more numerous; but that Mark invariably agrees verbally with Luke, where Matthew agrees verbally with Luke. He discovered too that in several sections, Mark's text agrees in one place with that of Matthew, and in another with that of Luke; and therefore appears at first sight a compound of both; but that there is not a single instance of verbal coincidence between Matthew and Luke only; and, consequently, that no such

compound can appear either in the text of Matthew or of Luke.

In the additional matter of these forty-two sections in Matthew and Mark, there are several instances of verbal agreement, but some of the longest additions are made in totally different words. In the additions common to Mark and Luke, though very numerous, there is only one instance of verbal agreement; whereas, in those common to Matthew and Luke, the verbal coincidence is very remarkable, and the more so as in the general matter they disagree.

In the whole sections, which are found only in Matthew and Mark, the verbal agreement is very general. In the whole sections contained in Mark and Luke, but not in Matthew, the verbal agreement is confined to one single passage. In the sections peculiar to Matthew and Luke, the verbal coincidence is very remarkable.

Such are the facts which Mr. Marsh discovered; and upon these facts he framed the following hypothesis:

"St. Matthew, St. Mark, and St. Luke, all three, used copies of a common Hebrew document; the materials of which St. Matthew, who wrote in Hebrew, retained in the language in which he found them, but St. Mark and St. Luke translated them into Greek. They had no knowledge of each other's gospels: but St. Mark and St. Luke, besides their copies of the Hebrew document, used a Greek translation of it, which had been made before any of the additions had been inserted. Lastly, as the gospels of St. Mark and St. Luke contain Greek translations of Hebrew materials, which were incorporated into St. Matthew's Hebrew gospel, the person who translated St. Matthew's Hebrew gospel into Greek frequently derived assistance from the gospel of St. Mark, where Mark had matter in common with St. Matthew; and in those places, but in those places only where St. Mark had no matter in common with St. Matthew, he had frequently recourse to St. Luke's gospel."

In addition to this, Mr. Marsh supposes that beside the Hebrew document, which was used by all the three Evangelists, there was another which he calls supplemental, containing a collection of precepts, parables, and discourses, placed without any regard to chronological order, used only by Matthew and Luke, and from which they derived those sections peculiar to themselves, and which are inserted in places that do not correspond to each other.

This system might be thought to render the Evangelists mere translators

and transcribers, and this has actually been objected to it, but without sufficient ground. Mr. Marsh has represented "each of them as acting with the freedom of authors, and *augmenting* the common matter by frequent insertions of circumstances, or explanatory annotations which are not inserted by the other two."

Having, with great labour and ingenuity, framed this hypothesis, which does not pretend to rest upon historic evidence, the author rigidly submitted it to the only test by which its real value can be tried; he applied it to the solution of the various phenomena which in his laborious analysis of the three first gospels, he had discovered; and the end to be obtained was answered. The difficulties which upon every preceding system still remained, were upon this removed; and every instance of verbal agreement, or of verbal disagreement, satisfactorily accounted for. But it had not been long before the public, when an anonymous writer (now supposed by some to be the Bishop of Oxford) published "*Remarks on Michaelis and his Commentator, by way of Caution to Students in Divinity*," in which this new hypothesis was attacked with much animosity, and no little unfairness. To these Remarks Mr. Marsh very shortly returned an able, and to us a satisfactory answer. His anonymous "adversary," as he uniformly styles him, republished his "*Remarks*," with a short preface prefixed, and 70 pages of notes, subjoined by way of reply to Mr. Marsh's answer. This has called forth the "*Illustration of the Hypothesis*" now before us, and which we hesitate not to pronounce a complete vindication of himself and of his system, from some very illiberal charges, and some totally unfounded objections, brought by the remarker; and, at the same time, a justification of all the charges which he had advanced against that writer.

The anonymous objector to Mr. M.'s hypothesis says, that he "must maintain that it derogates, or at least advise others to consider whether it doth not derogate, from the authenticity, integrity, credibility, and inspiration of the gospel." How any one, who pretended to understand the hypothesis, could thus speak of it, we are at a loss to discover; but we suspect that the remarker is not even yet fully master of the subject which he has laboured to controvert. The authenticity of the gospels, espe-

cially by Mark and Luke, Mr. Marsh has shewn is established by his hypothesis: that although the hypothesis relating solely to the origin of the gospel, has no concern with the state in which they have descended to the present age; yet the principle upon which it is founded, the verbal testimony of the three first Evangelists, affords a strong evidence, that they remained unaltered during the first hundred years, and thus "carries the proof of their integrity up to the very source, which never had been done before." Nor does the hypothesis derogate from the inspiration of the gospels, once it will admit, as clearly as any other, "a never-ceasing superintendence of the Holy Spirit to guard the Evangelists from error." These are the subjects upon which the first part of the Illustration is employed. In the second part Mr. Marsh silences the objection which the remarker had drawn from the want of historical evidence; he shews how the original document may have been lost and forgotten, though he cannot "produce an instance," as his "Adversary" requires him to do, "of any originals the very memory of which has been blotted out and annihilated;" and he convicts him of having advanced

many futile and absurd objections, and of wilful misrepresentation or gross ignorance in multiplying the *two* sources, from which Mr. Marsh derives the three first gospels, into *ten*. He then advances to the analysis of the instances which the anonymous remarker has produced from the Evangelists, to prove that the phenomena, for which the hypothesis is to account, do not exist; and he shows in the most satisfactory manner, that they are either erroneously stated, or confirm the existence of the phenomena.

Through this examination our limits will not permit us to follow the learned author, nor to do more than to observe that he has substantiated the accusation which he before alleged against his "anonymous adversary," of having borrowed his learning, and unfairly used it; and proved, in a very masterly manner, all that he had asserted respecting the *Ἀπομνημονεύματα* of Justin.

We thus take our leave of this truly learned author, sincerely thanking him for the service which he will be found to have rendered to the cause of Revelation, when his hypothesis shall be more generally understood, and the consequences deduced from it, to which we are convinced it leads.

ART. IX. *A Dissertation concerning the Writer of the Fourth Gospel; or, Considerations tending to shew that John the Apostle and John the Evangelist were different Persons. Dedicated to the Memory of Dr. George Campbell, late Principal and Professor of Divinity in the Marisball College, Aberdeen. By the Rev. Mr. JAMES M'CONOCHIE, Minister of the Gospel at Crawford. 8vo. pp. 117.*

CRITICS have ever experienced some difficulty in reconciling the character of the beloved disciple and the Evangelist, with that of the son of Zebedee and the Apostle; but, as far as we know, it has never occurred to any person but the author of the treatise before us, that they were two different persons; "It appears to me," he observes, p. 7. "that John, the son of Zebedee, or John the apostle, whose occupation, before he was called by our Saviour, had confined him to the sea of Tiberias and its banks, was not the author of this (John's) gospel; that the author was a native of Jerusalem, or of the land of Judea, near to Jerusalem; that he, or some of his relations, had property in the city of Jerusalem, or near to it; that he attended upon Jesus when he was at Jerusalem, or when he tarried in what is called in the New Testament, the land of Judea, but that he seldom accompanied him into Galilee." He further observes, p.

8. that he is "led to maintain this solely from a persuasion, that such a supposition will be found to cast light upon various facts and incidents, recorded in that and the other gospels, which are but very imperfectly explained on the common system."

In order to establish this new hypothesis, the author collects all the notices he finds in the three first gospels, concerning John the Evangelist, and then considers what John says of himself in his own gospel.

He remarks that "John the apostle is no where mentioned without his brother James, and both are commonly designed the sons of Zebedee;" whence he would conclude that there must have been another disciple called John. The title given to the sons of Zebedee accords not, he thinks, with the character of the Evangelist: and in the reply which Jesus made to the twelve upon occasion of a dispute concerning precedence, he

"descries the features of a beloved disciple." The youth whom Jesus presented to the twelve was John.

From the general character of the fourth gospel, as well as from several detached passages, Mr. McConochie argues that it was not the production of a fisherman, nor of one who had been born, or commonly resided in Galilee. The most material arguments are drawn from the conclusion of this gospel; and many circumstances are pointed out, which tend to shew that the transactions of the night preceding the crucifixion, lead to the conviction, that the disciple who leaned on the breast of Jesus, was not the son of Zebedee. Two of these we shall here select.

"He," John the Evangelist, "went with Jesus into the palace of the high priest, and he intimates the reason:—he was known to the high priest. Here I would ask, if this was John the apostle, what opportunities had he of being known to the high priest? His occupation had confined him to the sea of Tiberias and its banks; and since he became a follower of Jesus, he was in the wrong way to become acquainted with Caiaphas. But if he was an inhabitant of Jerusalem, and a person of some reputation among the Jews there, he might well be acquainted with Caiaphas, before he became high priest."

"John was so well known in the palace, that as soon as he spake to the damsel who kept the door, Peter was admitted. He is no sooner admitted, however, than his air and habit discover him to be a stranger, and his speech bewrayeth him to be a Galilean. First one servant attacks him with questions, then another, and then a third. All this time the least suspicion falls not upon John. If then it was John the apostle who was now present in the hall of the high priest, how came it that his air, garb, and language, did not bewray him also to be a Galilean? whence came it that John, the son of Zebedee, should have got so much the better of his Galilean accent, and his rustic appearance, as to escape all interrogatory; while poor Peter, who had been his companion for life, and who had come up from Galilee with him, was so hard put to it in these respects? I am persuaded that, on the common hypothesis, these questions are unanswerable. But allowing that John the Evangelist was an inhabitant of Jerusalem or its vicinity, the whole matter is easily cleared. His air and accent were those of a townsman. These, with the circumstance of his being known to the high priest and his family, set him above all suspicion of being connected with Jesus.

"No two persons could be more differently circumstanced than John and Peter in

the palace of the high priest. Every thing that befalls Peter indicates the stranger; the conduct of John implies acquaintance, if not intimacy."

This reasoning proceeds upon the supposition, that by the phrase "*another disciple*" the Evangelist denotes himself. Of this there have been considerable doubts; but as these have arisen from its never having been supposed that the Evangelist was not the apostle, if the other arguments advanced by the author before us should induce any one to believe that they were different persons, the fact here produced will be acknowledged to add much to the confirmation of the hypothesis. Again,

"Jesus seeing his mother, and the disciple standing by whom he loved, he saith unto his mother, Woman, behold thy son; and to that disciple he saith, behold thy mother." These words have a brevity and emphasis peculiar to themselves. To me it appears the parents of the disciple to whom Jesus here addresses himself were dead; at least that he had no mother, to call off his attention from the duty which Jesus lays upon him. Now we know that the mother of Zebedee's children was yet alive; that she was one of the company which came up with Jesus to this passover; and was, at this moment, a mournful spectator of the awful scene. The words of Jesus to John I would thus paraphrase: "Thou art deprived of thy parents, my mother is about to be deprived of her son; treat her as a mother for my sake;" and his words to his mother thus, "Thou art about to be left childless; behold, in this young man, the disciple whom I love, in him thou wilt experience a son; treat him as such."

"I would also observe, that what is here said certainly favours the supposition that John had his house or property near at hand; whereas John the apostle was at a great distance from his home; not to mention that he forsook all to follow Jesus. He was not therefore in a capacity of immediately fulfilling the duty here recommended, which it is expressly said John the Evangelist did: 'From that hour he took her to his own home.'"

In a postscript the author observes,

"In the Romish martyrology, I find an anniversary marked for the death of John the Apostle, and an anniversary for the death of the Evangelist. The knights of Malta take their designation from John of Jerusalem."

We shall offer no remarks either to confirm or to controvert this novel hypothesis. We recommend it however to the attention of theologians. It will

solve what have hitherto been considered as very serious difficulties; and, in the hands of some one more accustomed to conduct investigations of this nature,

than we suspect the author is, it may be made to assume a form which may produce a fuller conviction of its truth.

ART. X. *Six more Letters to Granville Sharp, Esq. on his Remarks upon the Uses of the Article in the Greek Testament.* By GREGORY BLUNT, Esq. 8vo. pp. 195.

WE read with more attention, than we were soon convinced they deserve, the Remarks of Granville Sharp, and the letters addressed to him by Mr. Wordsworth. It appeared to us, according to the motto selected by the writer before us from bishop Pearson's works, that the deity ascribed to our Saviour ought not to be tried by any such kind of school divinity: and that no fundamental doctrine should be examined, censured, and condemned by  $\epsilon, \tau, \rho\sigma$ . The theory of Mr. Sharp was however proposed and defended with such imposing confidence, and so many hard words and illiberal reflections were cast out against those, whose creed is not exactly such as is generally professed upon the subject of the person of Christ, that we not only expected, but were desirous that some champion would appear to take up the gauntlet which the redoubted knights of the Greek article had thrown down. Gregory Blunt, though skilful and valourous, is not exactly the person upon whom our choice would have rested; nor does he use his weapons according to the rules which we should have prescribed. He has fought, however; and impartiality compels us to confess that he has prevailed: and no wonder, since he opposed the weak flourishes of a magician's airy wand, by a ponderous club of argument; and sent against the rust-eaten armour of mouldering fathers, the arrows of reason,

ΩΚΕΧ ΓΕΛΩ  
ΦΩΝΨΥΤΖ ΟΥΝΕΤΟΪΣΙΝ\*

To remain uninterested spectators of the contest was impossible; but we should have been better pleased had our knight Gregory conducted himself in a more courteous manner, appeared more sensible of the dignity of the character he sustained, and withheld himself from pouring ridicule upon a fallen foe. Upon entering the field he thus salutes his adversary:

"I here previously declare, that though I don't know you, yet from all I hear, I

firmly believe you to be as honest and good a man as myself, and am willing to suppose that you may be a much better, already possessed of many virtues which I am only labouring to acquire; and that in this persuasion I greatly reverence your character, and should be sorry to give you pain: though I must say, that you don't know much about the Greek article, nor about christianity, or you would never have dreamt of looking for the latter in the former.

"When I say christianity, I do not mean practical christianity, which, in my opinion, formed upon a careful perusal of my bible, though not it seems in your's, is the only real, genuine christianity; containing all that Jesus and his apostles ever put into their religion. No, Sir; God forbid I should derogate in the smallest degree from your knowledge of that christianity, which cannot be described in fewer, or better words than those of the apostle, "the cross of Christ;" and which consists in crucifying all our worldly and selfish appetites and lusts, and in being "dead indeed unto sin." This christianity, which, because it was so plain and simple, and had so little to do with learned systems, disputes, and controversies, was foolishness to the Greeks of old, as it still continues to be to many modern Greeks and disputers of this world, and is in danger of being rendered every day more and more foolish by such labours as your's—this christianity you and I, and all of us, understand well enough; because the true religion of Jesus is so plain, that no one ever did, or could misunderstand it; though none of us cultivate it with such care and strictness as we ought to do; and for that reason alone we live so uncomfortably together, and have so much wretchedness and misery to complain of among us; and must continue so to live and to complain till our christianity be less in our heads, and more in our hearts.

"No, Sir; when I say that you do not know much about christianity, I mean theoretical christianity;—a thing which you and many others, for want of knowing better, suppose to be, in some shape or other, the christianity of the scriptures, but which, in every shape that it can assume, and it can and does occasionally assume a greater variety of forms than ever Proteus did, has nothing of christianity belonging to it but the name. I mean the motley christianity which men fabricate by sewing scraps and bits of texts together, as they make a history of the Jews out of Homer,\* or of the gos-

\* "Homerus Hebraizans."

pel out of Virgil; \* a christianity which must be dug out of Greek articles and plural Hebrew nouns and verbs, and such abominable holes, as no christian, who is not so hoodwinked by the nursery, the church, or the state, as to be quite blind to the broad religion of the bible, would ever think of groping in for 'the light of the world.' (John viii. 12.)

"We are told, that apostolical christianity, which is to this, Hyperion to a satyr, was not hidden in a corner, (Acts xxvii. 26.); but this 'thing of shreds and patches' is to be found nowhere in the bible but in holes and corners. And when, by 'observing times,† and using enchantments and witchcraft,‡ and by dealing with familiar spirits and wizards,§ (2 Chron. xxxiii. 6.) some theological Manasseh drags it forth to view, it comes reluctantly by inches, and appears at last in such a questionable shape, that if a christian can but muster up courage to look it steadily in the face, he will soon see what an unsubstantial visionary form it is, and will behold it instantly shrink from his sight; and if he will but continue to pursue it with a fearless eye, and fixed regard, will find it vanish into air, 'and what seemed corporal, melt as breath into the wind.'|| Let him but follow the apostle's advice (1 Cor. xiv. 20.), and not be, what the generality of christians are upon all questions of this sort, children, afraid to use their understandings; but let him be upon this, as upon every other matter that concerns his religion, though a child in malice, yet a man in understanding, and he will see and know, what I have said you at present seem to know so little of, that all theoretical christianity is 'man's device' (Acts xvii. 29.), the mere coinage of the brain, the 'trumpery' of fathers and councils, of theologues and schoolmen, of 'eremites and friars, white, black and gray."

In the course of the contest he deals this mighty blow:

"By the application of your rule to the Greek text of the following passages, you

may shew that there is no difference, not only between a street and a lane (Luke xiv. 21.), but between a high-way and a hedge (ibid. verse 28.); not only between love and peace (2 Cor. xiii. 11.), but between consolation and salvation (2 Cor. i. 6.) You may prove not only that high-priests and scribes, (Matt. ii. 4.), that scribes and pharisees, (Matt. v. 20.), that scribes and elders, (ib. xxvii. 41.), and that publicans and sinners, (ibid. ix. 11.) were the same persons; but moreover, that pharisees and sadducees, (Matt. iii. 7. xvi. 1, 6, 11, 12.), apostles and prophets, (Ephes. ii. 20.), buyers and sellers, (Matt. xxi. 12.), were the same; that Mary Magdalene was the same as Mary the mother of Joses, (Mark xv. 47.); and that there was no difference between Joses himself and his brother James, (Matt. xxvii. 56.), between Peter and John, (Acts viii. 14.)

"From Luke ix. 28, you may, by virtue of your excellent rule, extract a new, secondary, apostolical trinity, by way of supplement to that commonly received; and that too, all from one text, without being forced, as is the case in manufacturing the old trinity, to dig a little bit of mystery out of a text in one corner of the bible, next to splice that to a bit more out of another corner, afterwards to cke out that with a bit from a third, thus hopping about from text to text; and after all the toil and labour bestowed on it, after all the twisting and turning, and vamping, and soleing and heel-piecing, to rest satisfied with producing what to a common eye, not tutored and trained from infancy to look askew at it, appears just as broad as it is long, though when it is squinted at, through a theological magnifying glass, such as you make use of to turn points of separation into 'lines of connection,' (p. 48.) many persons are apt to fancy that it looks 'nearly three times as long as it is broad.'¶

"From Luke viii. 1, 2, you might shew, by your rule, that the twelve apostles were all women; as you might make it appear, from the same evangelist, (xxiii. 27.), were likewise the great company of people that

\* "Virgilius Evangelizans."

† "For the purpose of making out the doctrines of pre-existence, the rites and discipline of particular seasons, &c. &c."

‡ "Conjuring with supplications, adorations, and invocations, &c. and juggling with names and titles, actions and attributes, persons and natures, &c. &c. at which sort of work you and your editor have nibbled a little, you in your notes, (page 5, &c.) and he in his table, and plain argument, (p. 65, &c.)"

§ "The subtle doctors, deep divines, and systematic expositors of ignorant and corrupt magies; many of whose mystical mummeries are still so current and contagious among us, that it is hardly possible for the youthful mind to escape the infection, or to postpone the attack till it has acquired strength to resist a taint, which, when once it gets into the habit, it is very difficult to get out again: so that many a poor child is the miserable victim of it all his life long. I am afraid, Sir, you had the disease badly in your youth."

|| "Macbeth."

¶ "Early and interested prepossession, or prejudice, is a magnifying-glass that makes mountains of molehills, or the greatest matters of mere nothings."

followed Jesus to his crucifixion, and moreover, (from verse 49 of the same chapter) that all his acquaintance were persons of the same sex who followed him from Galilee.

"From Acts xv. you might shew that Paul and Barnabas, who were very different persons at the beginning of the chapter (ver. 2.) and who, though without any express articles of separation subsisting between them, (and therefore, by virtue of your fifth rule and its exception, were beginning to grow rather ambiguous), still continued distinct for some time after (verse 12), got so confounded in the course of a few verses more, (verse 22), that it was impossible to distinguish the one from the other, till the successful application of your wonderful discovery restored each of them again, (verses 25, 35), to his separate personal identity and diversity.

"Many more discoveries, equally notable, might you make from Luke xi. 27. Acts iv. 5, 6. xv. 2. xxiv. 1. Rom. ii. 5. 1 Cor. iv. 9. 2 Thes. i. 4. &c. &c. but I shall content myself with mentioning only one, to be found in 1 Tim. vi. 13. where *θεος* and *χριστος* being connected in the way your rule requires, the former with, and the latter without the article, must necessarily be descriptive of one and the same person; but since each of these nouns is attended by a participle, and since the article which is prefixed to the first participle is repeated before the second, the two nouns must on that account be descriptive of different persons: and thus we have both the identity and diversity of God and Christ established in the compass of a single verse, proving clearly, as I have somewhere seen, or heard it expressed, that they are "united, though divided; divided, though the same."

"It makes no difference, I apprehend, in this reasoning, that 'the substantive of personal description, as you call *χριστος* (p. 30), is followed by the proper name *Jesus*; since *χριστος* here does not make any part of the proper name, but is merely an epithet, like the similar personal noun *κερως*, in a similar situation. But what if it were unavoidably a proper name? We have seen that no reasoning nor practice of yours, will justify us in depriving it of the benefit of your rule on that account. Or, lastly, what if Paul had thought fit to have omitted the word *Jesus* altogether, which he might have done if he had chosen it, for any thing that I can see to the contrary?

"Such are the curious consequences to which your theory of the article fairly and directly leads; consequences from which no arbitrary, groundless, and unsupported limi-

tations can extricate you, as you must see, unless some theological *ignis fatuus* has completely dazzled your sight."

As a bye-blow, the following will shew our knight's dexterity.

"Your conclusion is no less curious, when you infer (p. 8, and 9) that because Jesus is called a shepherd, and God is also called a shepherd, therefore Jesus is God. 'Oh! most lame and impotent conclusion!' (Shaksp.) Saul is called king of Israel (1 Sam. xxiv. 14), and God is also called king of Israel (Isa. xlv. 6) therefore Saul is God! The Lord have mercy upon us! If the Bible, in its object and design, had not been one of the plainest and simplest books in the world; if it had not been its *only* purpose to make us good and happy; and if that purpose had not filled every page of it, it must long since have been overwhelmed by the treatment it has met with. No other book was ever so used, or rather so abused, as this has been. No other book could have survived such usage. That it still continues to answer its design, and to do good among us, after it has been so bedaubed, so pitched and plastered over with one silly conceit or another, proves its consummate excellence, proves how copious and full, how constant, steady, and true it is to its main end and object, so that there is no way of wholly putting out its moral light, unless every chapter, nay, almost every verse of it, be completely *bunged* up with theology. I wonder no body ever took it into his head to maintain, that it ought to be read *βασποφινδον*, one line forwards, and the next backwards, or up and down, like the Chinese, or that the two columns, where it is so printed, ought to be read across, in the manner of Papyrus Cursor. If it is to be explained so differently from all other books, I do not see why it may not be read differently from all other books. If common sense is to be wholly laid aside in expounding it, why may we not as well lay aside common sense in reading it? I verily believe, even then, it would look more like a book of morality than any thing else."

That Gregory Blunt has managed the contest ably, no one can deny; but many will think with us, that a little more attention to the feelings, and a little more forbearance towards the prejudices of those whose creed he attacks, would have been more becoming and more wise.

ART. XI. *Elements of Religion; containing a simple Deduction of Christianity, from its Source to its present Circumstances. In a Series of Letters to a Young Lady. By Mrs. MARRIOTT.* 4 vols. 8vo. pp. 1230.

WHETHER the articles of the church of England are strictly Calvinistic, or

not, has long been a topic of controversy. The spirit of the English church

was, however, certainly long at variance with its articles. During the space of more than a century and a half, the tenets of its leading divines were Arminian, and the stricter creed, more consonant, perhaps, to the principles of the first institutors, was, by the prevalent party, regarded with suspicion and disfavour. The moderation of the clergy was accompanied with a remission of that zeal, which seizes the attention and engages the passions of the multitude; and the national church, long unassailed by any powerful external force, was not sensible of any diminution of strength, when on a sudden there arose, within its very pale, an adversary more formidable to its repose and unity than it had long experienced. The sects which originated at this period, with every profession of respect and reverence for the established constitution of religion, directed all their complaints to the unfaithfulness and degeneracy which they ascribed to the depositaries of its functions. Their tenets, in themselves accommodated to popular apprehension, they urged with that zeal, and maintained with that general consistency of life and demeanour, which were calculated to make the most powerful impression; and in every part of the kingdom they proceeded to the formation of distinct places of worship and instruction, subsidiary, as they professed, to those of national institution, and rendered requisite by the want of evangelical teaching, under which, in their estimation, the country laboured.

This internal revolution, as usually happens in similar cases, has not been without influence on the regular clergy. The leading members have felt themselves compelled to a nearer assimilation of their public teaching, with the terms of their subscription: the peculiar doctrines of christianity, as they are usually termed, are on the one hand treated with more respect, and more frequently insisted on, though not to the exclusion of useful topics of morality; while, on the other hand, the guilt of schism is more strenuously maintained and urged, and the false confidence of arrogance and enthusiasm severely and justly arraigned. Such is the spirit of the church of England of the present day: in aid of this spirit, its members of every rank have come forward, and the work which is now before us may be

regarded as a humble contribution to the general cause.

This work consists of forty-nine letters, addressed by Mrs. Marriott, to a young lady, her near relative. They are a combination of reflection and narrative. In the first three are treated the fundamental topics of religion, the existence and providence of God, and the importance and actual communication of divine revelations. In the succeeding forty-two, the history of the Old and New Testaments is deduced; and the remaining four comprize a very brief sketch of subsequent ecclesiastical history.

The important subjects of the first division are treated, though in a manner somewhat declamatory, yet often with beauty of expression, propriety of thought, and justness of argument.

In the narrative part, the beautiful simplicity of the scripture histories frequently suffers from the ornaments of Mrs. Marriott's pen. The concession of Abraham to Lot, for instance, is thus related: "Several disputes had arisen between the herdsmen, when, to remedy the inconvenience, and obviate every occasion of farther strife, Abraham, equally affectionate and generous, with the kindness of a brother and the urbanity of a gentleman, requested, that out of respect to their near consanguinity, there might be no farther contention either between *themselves* or *their servants*; but as a separation was now requisite, he desired Lot would regard the whole country as before him, freely to chuse in it his place of residence." Vol. I: p. 201. The following is the account of the interview of Abraham's servant with Rebecca and her family, and his return to Canaan, after having accomplished the object of his journey:

"His prayer was scarcely ended, when he saw a very beautiful young woman, coming from the city, with a pitcher upon her shoulder. Charmed with her appearance, the moment she returned from the fountain, he ran to meet her, and supplicated the bounty of a little water: "drink my lord," she replied, with respectful courtesy; nor did her good nature stop at the obliging haste with which she lowered the pitcher from her shoulder, and satisfied his thirst with the cooling beverage; for she added, "I will give drink to your camels also, till they are fully satisfied."

"Charmed with these proofs of courteousness and benevolence, anxious to know

whether his prayers were heard, and this bright gem ordained to grace the bosom of Isaac, in silent admiration he contemplated the performance of the fatiguing task she had assigned herself; he then approached her, and soon, to his raptured astonishment, learned that she was indeed the person he had traversed such an extent of country to find, for that she was Rebecca the daughter of Bethuel.

“Being conducted by this fair maid to her father's house, where he was received with the most cheerful hospitality, when the steward communicated the purpose of his journey, and the singular incidents with which it had concluded, we perceive, that the opinion, which Abraham had entertained of the constancy of his family, to the true religion, was just, and that they, amidst the polytheism of the age, retained both knowledge and reverence for the one great and living God; for Bethuel, and his son Laban, acknowledged, that as the interposition of the Lord was evident in the events of the evening, nothing was left for them but silent acquiescence in the divine will; “We cannot,” they said, “say unto thee bad or good; behold Rebecca is before thee, take her and go, and let her be thy master's son's wife, as the Lord hath spoken.”

“After having bowed in pious gratitude to the Lord for this prosperous termination, the joyful steward with alacrity presented to Rebecca, and her family, the nuptial gifts, which were splendid and costly, as became the wealth and generosity of Abraham; and the next morning, the indefatigable man urged an instant departure for Canaan. To this the family objected, as reluctant to part from Rebecca so soon; the decision was referred to Rebecca herself, who cheerfully and readily acquiesced in the servant's reasons for his speedy return; and after receiving the paternal benediction, and the blessings of the rest of her kindred, she quitted Syria for ever, seated on the camels of Abraham, her nurse, with some other female attendants, the companions of her journey.

“When this interesting caravan approached the habitation of Isaac, Rebecca observed a man walking in the fields, and inquiring of the servant who he was, and finding him her destined husband, she quickly alighted from her camel, and, in token of modesty and submission, covered herself with a veil.”

Mrs. Marriott, in her deduction of Christianity, as we have before intimated, by no means confines herself to the simple narrative of the history, but indulges herself in frequent speculations on the various topics of religion and morality which come before her. On subjects which permit her to expatiate, she sometimes give too much liberty to the flights of her imagination. As an instance of this fault, we might refer to

her reflections on the plan of redemption, vol. I. p. 78, &c.

The doctrines which Mrs. Marriott maintains, are in general those which are commonly styled orthodox. It is not to be expected that in letters addressed to a young female friend, all the subtleties of polemic disputation should be very nicely discussed, and we suspect that the notions of the author herself on these topics are not always systematically accurate. Her expressions on the subject of the trinity, are sometimes rather Arian than Athanasian. The death of Christ she considers as strictly a vicarious sacrifice, with all those appalling consequences, at which, to use the expressions of Dr. Hurd, “Reason stands aghast, and Faith herself is half confounded.” The free-agency of man, she asserts in the most unqualified terms, and rejects, with the appellation of gloomy, those doctrines of Calvin, which are founded on the contrary hypothesis. Her sentiments on the depravity of mankind, the influences of the Spirit, and other doctrines connected with these, she nowhere clearly states.

Though Mrs. Marriott repeatedly depreciates the use of reason in the estimate of doctrines of divine origin, and relating to divine subjects, yet on other occasions she discovers some solicitude to shew the harmony of revelation with the dictates of human reason. In her fifth letter, she assumes a considerable air of triumph, on having turned, as she imagines, the weapons of the Deists against themselves. To accomplish this purpose, she first lays it down as a position, that Pope's Essay on Man is a deistical production, the arguments having been supplied by Bolingbroke. She then selects the noted principle on which that writer expatiates so largely and poetically, of the necessity of a gradation of ranks in the harmonious system of being, proceeding by minute variations from the highest to the lowest order.

Far as creation's ample range extends,  
The scale of sensual mental powers ascends.

This doctrine she proceeds to fortify by a quotation from Locke. We were anticipating with much uncertainty the termination of this argument, in its expanded state occupying several pages, when on a sudden the following conclusion rushed in unexpectedly upon us: “Reinforced by this venerable opinion, arguing from this allowed analogy, I

will presume to wing my daring flight above this sublunary sphere; and ascending from man to the heavenly intelligences, contemplate order beyond order, progressively rising in perfection, till I reach at length that stupendous, that all-glorious link in the great chain of beings, which unites the God-head with all his creatures: this, I cry, is indeed the Son of God! It must be so; for that wonderful being which unites the great Supreme with all the inferior spiritual orders, must intimately participate the essence of the Deity, or the created and uncreated substances could not be united." In what creed will this be admitted as orthodox doctrine? Pursuing this analogy we might argue, that there will not only be three, but four, five, or a greater number of beings in the descending chain, differing from each other almost insensibly in nature and attributes.

Indeed, we are of opinion, that Mrs. Marriott incumbers herself much with her metaphysics, and that she had better have altogether disclaimed their aid. We will give one other instance of the unfortunate application of her favourite principle.

Then in the scale of reasoning life, 'tis plain  
There must be somewhere such a rank as  
man,

says the poet. Hence our author vindicates the plan of Providence, in the formation of such a rank as that of man, apparently full of contradiction and confusion, a mixed nature, a link necessary to connect the chain, mortal and immortal, sensual and intellectual, a chaos of wisdom and folly, of vice and virtue. But in other parts of her work she ascribes many of these consequences to the fall. The fall then, as the instrument of making man what it was necessary in the plans of Providence that he should be made, must have been an event ordained and accomplished by that Providence which has appointed this order of things. But this is inconsistent with the supposition of that free-agency, which our author uniformly attributes to Adam as well as to his descendants.

In describing the origin of the human soul, Mrs. Marriott wanders into the regions of Stoicism.

We transcribe one other extract from the conclusion of the work, which appears to us to merit severe reprehension.

"We have seen, my dear M., from the first promulgation of the Gospel, to the early times of the Reformation, different sects arise among the Christians, some rational, some erroneous and fantastic, according to the temper and ideas of the founder; but all originating in a deep sense of religion, the necessity of rightly understanding the Scriptures, and an ardent desire of securing themselves salvation; and we are constrained to reverence the source from whence this variety of modes of faith and practice springs, though we find the current as it flows debased by admixtures of enthusiasm, fanaticism, and other human errors, derived from a weak head, and ardent temper, directing an honest and pious heart.

"But in our approach to modern times, we find other sects that cannot boast this meritorious origin, for on the contrary, they submit themselves to the detestable purpose of becoming agents to that being, whose unremitting industry is employed to overturn the Christian religion, the influence of which over the minds of mankind he dreads, as subversive of his own.

"This class begins with the Socinian, or Unitarian, whose precepts debase the Saviour of mankind to mere manhood, and reduce the Holy Ghost to a name only. They profess to believe that all our knowledge of divine things is derived from the Scriptures, and that it is not lawful to doubt their authenticity, or the truth of the historical facts they record; and also that the precepts of the gospel must be adhered to, for the regulation of life and action; but that the particular doctrines they contain, are to be understood in such a manner, as to render them conformable to the dictates of reason."

Had we not apprehended that it would exceed the proper limits of this article, we should have extended this quotation, to the picture which Mrs. Marriott, in the warmth of her imagination, draws of the deist, the modern philosopher, and the grand conspiracy which, in common with some other worthy persons, she supposes to have been planned in Germany, for the eradication of the Christian religion. In reference to the passage which we have extracted, we beg permission of asking one question: who has empowered Mrs. Marriott to pass these inquisitorial censures on the motives of men, whose hearts she cannot search? They profess sincerity: to their own master they stand or fall. We will furnish her with two quotations from the writings of dignitaries of the English church, who rank among its brightest ornaments. One may teach her to express herself more candidly; the other, we hope, to think more justly. The first is from Abp. Tillotson. Referring

to the Socinian controversialists, he says, "and yet to do right to the writers on that side, I must own that generally they are a pattern of the fair way of disputing, and of debating matters of religion, without heat, or unseemly reflections on their adversaries; they generally argue matters with that temper and gravity, and with that freedom from passion and transport, which becomes a serious and weighty argument; and for the most part they reason closely and clearly; with extraordinary guard and caution; with great dexterity and decency; and yet with smartness and subtilty enough; with a very gentle heat, and few hard words; virtues to be praised where-ever they are found, yea even in an enemy, and *very worthy our imitation*," Tillotson's 54 Sermons, p. 521, fol. ed. Our second quotation shall be from bishop Watson. "Newton and Locke were esteemed Socinians; Lardner was an avowed one; Clarke and Whiston were declared Arians; Bull and Water-

land were professed Athanasians; who will take upon him to say, that these men were not equal to each other in probity and scriptural knowledge? and if that be admitted, surely we ought to learn no other lesson from the diversity of their opinions, except that of perfect moderation and good-will towards all those who happen to differ from ourselves." Mrs. Marriott, on more than one occasion, quotes the authority of Locke, and once with the appellation of venerable; yet she seems utterly unconscious of the wide discrepancy of his religious system from her own.

In fine, we believe Mrs. Marriott to be a very serious christian, and good woman; we only wish her a little more candour; and, as she professes to think on religious subjects, on some topics, a little more extent of thought. Those parents, who agree with her sentiments, will probably think her book a useful present to their children.

ART. XII. *An Exposition of the Lord's Prayer; in which are comprehended an Account of the Origin of that Prayer; an Explanation of its several Petitions; and a Demonstration, that according to its natural Interpretation, it contains a complete Summary of Christian Doctrine.* By the Rev. JOSEPH MENDHAM, M. A. 8vo. pp. 240.

THIS treatise, on the theological principles of the author, which appear to be nearly those of the articles of the church of England, is in the main a sensible, pious, and well-written performance, many parts of which may be usefully and satisfactorily perused by christians of every denomination. Mr. Mendham thus states, in his preface, the plan and objects of his work:

"Expositors of the Lord's prayer seem, in general, not to have bestowed sufficient pains in settling the precise and grammatical meaning of its several parts: and the errors, to which such neglect has exposed them, have necessarily multiplied in proportion to the extent and particularity of their comment; so that whatever merit their productions might possess, as theological disquisitions, they have failed in the qualifications which are essential to an exposition. No disrespect whatever is intended to these writers in the observation: it has, however, frequently and forcibly occurred to the author, that they have interpreted the prayer in question, as if it had been originally delivered in their own language, and almost in their own age.

"In stating these defects, the author has, in a considerable degree, described the plan of his own work, and pointed out his induce-

ment for undertaking it. He has endeavoured to bring forward all the information which can be attained, and whatsoever may be reasonably conjectured, concerning the origin and peculiar circumstances of the Lord's prayer; to fix, with all the precision which a diligent reference to critical works of the first authority could furnish, the exact meaning of each of its petitions; at least, to put in possession of the reader the materials by which he may judge for himself: and then, and not till then, to deduce from each part, critically explained, the various important and practical doctrines which this perfect and comprehensive form of prayer contains. A trial is made at the close, by what evidence the ancient opinion is supported, that the Lord's prayer comprehends a complete summary of the christian doctrine; or, in the laconic and forcible language of Tertullian, is an epitome of the whole gospel. In one word, it has been his object, not so much to say what *might*, as what *ought* to be said."

In the remainder of his preface, the author judiciously vindicates the exercise, and asserts the obligation of prayer, by arguments more philosophical and satisfactory than those which are frequently adopted.

With respect to the history of this prayer, Mr. Mendham, in common with

other writers; supposes that it was communicated by Jesus to his disciples, in conformity with the custom of many Jewish teachers of celebrity, whose practice it was to deliver some compendious form of prayer for the use of their scholars. This probability is confirmed, he observes, by the striking similarity which subsists between this prayer, and certain portions of the ancient Jewish prayers; "a similarity so close, that if the corresponding passages of the latter are collected into one prayer, they will nearly produce that which Christ delivered." The passages thus collected are as follows:—Our Father which art in Heaven: thy name be sanctified: thy kingdom reign: do thy will in Heaven: forgive us our sins: lead us not into the hand of temptation: and deliver us from Satan: for thine is the kingdom: and thou shalt reign gloriously for ever and ever. Of these passages, it is however to be observed, that several are modern.

In his consideration of this prayer, Mr. Mendham divides it into three parts; the first sentence forming an address; the last a doxology; and the intermediate six constituting the petitionary part of the prayer; the first three of these petitions referring to God; the other three to man.

Between the copies recorded by Matthew and Luke, it is well known, that there exists some dissonance. That the doxology inserted in the work of the former of these evangelists, is omitted by the latter, must have been observed by every reader of the New Testament; there is, however, reason for believing, that it was also wanting in the original copies of Matthew. It is unnoticed by the fathers of the three first centuries, though some of them have written expositions of the Lord's prayer; it is omitted by the most valuable manuscripts in which this part of the New Testament is preserved, and is wanting in several ancient versions. There is, however, another important variation in the reading of this prayer, which is found in the ancient copies, though it has disappeared from those of later date: the third petition of Matthew's copy, "thy will be done in earth as it is in Heaven."—These are wanting in the ancient manuscripts of Luke, and are omitted by Griesbach in his late edition of the New Testament. Some writers also tell us, that the second petition in Luke, in

place of the words "thy kingdom come," originally stood thus:—"may thy holy spirit come upon us, and purify us;" and there is reason for supposing this reading to be at least ancient, though perhaps not genuine. Should these variations be established, we must have recourse, says Mr. Mendham, to the hypothesis, that the prayers of Matthew and Luke are really distinct, and were delivered by our Lord on different occasions.

We find nothing either in the translation or exposition of Mr. Mendham, of sufficient novelty to require introduction to our readers; nor indeed could there be any reasonable expectation of novelty on a subject necessarily so exhausted. We make, with pleasure, the following practical extract:

"Here then is presented to us a wide field for the exercise and display of submission to the will of God; and when we pray that the will of God may be done in earth, we express our desire that mankind may yield a universal submission to the dispensations of his providence; that the rebellious children of Adam, from the extremities of the earth, may repent of their past disobedience, cast themselves down before the throne of their divine Sovereign, surrender themselves to his disposal, and become voluntary subjects of his government; that all the inhabitants of the world, all nations and languages, may with one spirit acknowledge him as their Supreme Governor; and devote themselves with absolute resignation to whatsoever he may appoint. But as *that* will never be done by all, which is not done by individuals; and as the principal obligation of the prayer lies upon those who offer it, we engage, by the use of it, first and principally for ourselves, that we will submit to the appointment of God in his providence; and that his will, if it is done by none besides, shall be done by us. We oblige ourselves, generally, to acknowledge that the Judge of all the Earth will do nothing but what is right, and to acquiesce in the wisdom and justice of all the divine proceedings. In all those events and dispensations of which we cannot perceive the object or propriety, it is a duty which we impose upon ourselves to bow with religious reverence. As far as an insight is afforded us, into the divine counsels, we see sufficient evidence of the wisdom and equity of all the transactions of the Great Ruler of the world; and what is veiled in obscurity, what is inscrutable to mortal eyes, we are bound to regard with the awe and admiration of the apostle, when contemplating a dispensation which he could not comprehend:—'O the depth of the riches, both of the wisdom and knowledge of God! how unsearchable are his judgments, and his ways

past finding out.\* But something more is required by our prayer than the submission of our understandings to the divine dispensations: our wills must likewise submit. We must be ready to bear with patience whatsoever it pleases God to inflict upon us; assured that he who governs the world, will order all things wisely, and cause them to work together for the good of his people, it is our duty to rely upon him with entire and unshaken confidence; nor even, if possible, to desire that the affliction with which he visits us, may be withdrawn an hour sooner, or be inflicted with the smallest degree less of severity, than is necessary to answer the gracious purpose which he designs to accomplish by it. In all conditions we ought to be resigned, and to sacrifice our will to the will of God. Howsoever severe, howsoever opposed to our natural propensities be the adversity which oppresses us, formidable as the trial may be to which we are called, and bitter as may be the cup presented to us, after the example of him whose steps we are directed to follow, it is our duty to submit, and say—"thy will be done,"—"not as I will, but as thou wilt."†

Mr. Mendham, in distinguishing the meanings of the term Father, as applied to God, in reference to Christ, and in relation to his followers, observes, "that the mention of the appellation, 'your father,' as applied to the disciples, and 'my father,' as applied to Christ, is very frequent; yet with such scrupulous attention was the distinction between the different senses of the appellation preserved, that when, after his resurrection, he appeared to Mary, and he came to the very verge of confounding that distinction, he avoided the impropriety by a very significant repetition:—"Go," said he, "to my brethren, and say unto them, I ascend unto my Father and your Father, and to my God and your God." We must confess that we do not, in this instance, see either how an impropriety was avoided, or how it was on the verge of existing.

In the description of the paternal mercy of God, which occurs in page 16, we think that a little too much of anthropomorphism is admitted.

The author of the present work, with many others, supposes an indefinite quality, which he denominates the glory of God, to be the primary motive of his action, and makes the usual distinctions between justice, goodness, and mercy.

We cannot help thinking that christians frequently embarrass themselves by false distinctions between these attributes, and that important practical errors result from any other considerations of them than as different exhibitions of the same quality, goodness, the true glory of God, and the constituent principle of all moral rectitude.

We were sorry to see, from any quarter, any disparagement of the works of Dr. Paley, (see page 57) because we conceive him to be one of those writers on theological subjects, to whom the age is most indebted. We considered it as a pleasing presage of general improvement, in this most important branch of knowledge, that the use of some of his works was adopted in one of our universities; in short, we are inclined to apply to the learned archdeacon that eulogium which Quintilian gives to Tully:—"Ille se profecisse sciat, cui Cicero valde placebit;" and the converse of this proposition, we believe, will be found accurate.

With the theological sentiments of the respectable writer, we have at present little concern; they are, in this work, by its nature, in general rather assumed than proved. We are, however, surprised at his supposition, that the whole of what *he* esteems christianity, is deducible by a fair and natural interpretation from the words of this prayer.

We are sorry that Mr. Mendham, from many parts of whose work we have received much satisfaction, should give any occasion for the inculcation of an important moral quality, the very name of which appears to be now almost exploded by many writers of theological controversy, that of candour. The word candour they seem to consider as implying something insidious, or at best as synonymous only with weakness of mind, and incompetency of judgment. By requesting candour, we do not require a man to abandon his judgment, or to surrender the importance of his opinions; we only expect, (what it surely is not too much to expect) when the many fallibilities of the human mind are considered, that he will admit the possibility, that they who dissent from him most widely in judgment, respecting important topics, may at least be sincere

\* "Rom. xi. 23."

† "Math. xxvi. 42. and 39. See likewise Acts xxi. 14. Tertullian expresses this part of the sense of the prayer:—*Jam hoc dicto ad sufferentiam nosmetipsos præmonemus.*"

lovers of truth, however unfortunate in their attempts to discover it. Mr. Mendham speaks of the profane audacity of Dr. Geddes; on Dr. Priestley he bestows the denomination of heresiarch; and some opinion of Schleusner, (we suppose, from the connection, respecting the non-existence of a great fallen spirit) he stigmatises with the epithet of infidel. However singular, erroneous, or inconsistent the creed of Dr. Geddes may have been, all which we are disposed to a certain extent to admit, we are still persuaded that he was a sincere christian; meaning by a christian, one who

admits the divine authority of Christ's mission, and who lives in habitual obedience to the requisitions of the christian law. Dr. Priestley stands too high in the estimation of the world; whatever he may suffer in that of many of his countrymen, to need defence; and we are inclined to hope, that a man needs not to be esteemed an infidel, though he should not believe the being of a devil to be incorporated with that of a God, or though he should even think that the New Testament contains no revelation respecting the existence of such a being.

### EVIDENCES OF REVEALED RELIGION.

ART. XIII. *An Enquiry into the Necessity, Nature, and Evidences of Revealed Religion.*  
By THOMAS ROBINSON, A. M. Rector of Ruan Minor, Cornwall. 8vo. pp. 303.

THIS useful compilation (for it cannot lay claim to any higher title, nor, we apprehend, does the author propose that it should) originated in a wish to supply what appeared a desideratum; a work in which the necessity, nature, and evidences of revelation should be presented in one view, and formed into a connected subject of discussion.

"This," the writer informs us, "he has attempted, by exhibiting, in a plain and popular manner, the incompetency of reason as a religious instructor, by a brief elucidation of the several parts of which revelation is composed, and by proving the strength and solidity of the grounds on which mankind are expected to accept and believe it to be the word of God. It has been his object to compress much useful matter into a narrow compass; and to arrange it with that degree of order and distinctness, which will render it intelligible to all capacities. He has laboured to make it of so comprehensive a nature, that whilst sufficient may be found in it, to render it an instructive and explanatory companion to the Bible of the mechanic, it may not be wholly beneath the notice of others, whose education has been more liberal, and attainments more extensive. The former may, perhaps, gather from it as much knowledge of the subjects investigated, as he may have occasion to acquire; whilst the latter may be induced, from such a cursory view of them, to solicit information from those great masters, who have brought to the discussion the united advantages of exalted talents, patient enquiry, and profound erudition."

The author has not been unsuccessful; and the work before us, though not marked by much originality of

thought, or novelty of evidence, contains within a moderate compass a considerable portion of valuable information.—The volume opens with a well arranged view of the imperfections which marked the religious knowledge of the ancients; from which the author deduces the necessity of a divine revelation. The revelation thus wanted, and which it was possible and highly probable that the Creator would grant, he asserts is contained in the books of the Old and New Testament. These books are then separately examined. The account of a Jewish dispensation is ably executed: the arguments for its divine original are selected with judgment, and the history of each book will be found interesting and useful. From the Old Testament, the author passes to the New. An account of each book is here also given; and the volume is closed by a succinct view of the arguments which have been adduced to prove the credibility of the gospel history, and the divine origin of the christian religion.

To some of our readers the following account of the mode in which the books of Moses were read by the Jews, in their public services of religion, may prove new and instructive:

"The books of Moses were originally drawn up in one continued, undivided work, and are still remaining in the same form, in the public service of the Jewish Synagogue. They are frequently quoted by the writers of the Old and New Testament, under the title of the Law; and are sometimes distinguished by the name of the Pentateuch. They were divided into fifty-four sections; a division

which, some of the Jews are of opinion, was made by the appointment of Moses himself; but which others, with greater appearance of probability, ascribe to Ezra. The Jews intended that one of these sections should be read in the synagogues every Sabbath day.—The number consisted of fifty-four; because in their intercalated years a month\* being added, there were fifty-four Sabbaths. In the other years, they reduced them again to forty-two, by joining together two short sections. They ended the last section with the last words of Deuteronomy, on the Sabbath of the feast of Tabernacles; and begun a-new with the first section from the beginning of Genesis, the next Sabbath after.—Each of these sections was again subdivided into seven parts, for as many readers; every Israelite having the privilege of reading, except women, slaves, and others, who were deemed incapable of doing it. Notwithstanding this privilege, a priest, a Levite, or some person of eminence, was usually selected in preference to those who were more uninformed; the latter being never permitted to begin till those of the former description had finished.† Till the time of the persecution of Antiochus Epiphanes, they were accustomed to read the Law only; but that being prohibited from being read any longer, they substituted, in the room of it, fifty-four sections out of the Prophets. When the reading of the law was restored by the Maccabees, the section read on the Sabbath out of the Law served for the first lesson, and that out of the Prophets for the second.‡ The reading of the Law, indeed, was not confined to the return of the Sabbath, as it was constantly rehearsed every seventh year, before all the people, at the feast of Tabernacles."

As a very fair specimen of our author's method, we select the following passage, where, speaking of the prevalence of christianity, he observes,—

"Here then is an effect proceeding from a cause, according to human estimation, inadequate to produce it. Nothing similar, as far as we are informed, ever took place before or since. Can any one believe, that an obscure peasant, in an obscure country, with no better assistance than twelve poor fishermen, could have brought about so great and extraordinary a change by any possible mode of human exertion? or is it credible, that, without co-operation and support, they would

have taken the steps they did to accomplish their object? If they had no surer method of advancing their cause, than that with which their own efforts could have supplied them, they would have had recourse to those things which are commonly successful on similar occasions; they would have attempted to impose on the understandings of mankind by conciliation and flattery; they would have dazzled their imaginations by visionary prospects of future advantage; and would have moved every engine, which is usually directed by the artful and designing against human weakness. But these things, so often practised by others, could not be turned to advantage by them. They possessed neither influence, wealth, nor power; they had, (with few exceptions) neither abilities, learning, address, nor eloquence; so far indeed were they from aiming at allurements, that the method which they took of making converts to their cause, was likely to operate as an effectual discouragement. They attacked the obstinate and rooted prejudices universally entertained for the established forms of religious worship; and loudly condemned those darling follies, vices, and superstitions, to which mankind had shewn so long and fond an attachment; they exhorted their hearers to embrace a cause, which could not fail to involve them in the most serious evils; and to acknowledge the divine mission of one, whom, far from clothing with supernatural splendor, they represented as terminating a miserable life by an ignominious death. All they had to put into the opposite scale, was the promise of a recompence, invisible and distant; and of such a nature, as preconceived opinions must reasonably regard as chimerical and delusive. This address was not made in a dark age, or to a savage people, but to the wisest and most enlightened nations of the earth, at a time when human learning and philosophy were at their greatest height; thus every motive that usually influences the mind of man, religion, custom, law, policy, pride, interest, vice, and even philosophy, were united against the Gospel. These are enemies at all times formidable and difficult to be subdued, even when attacked upon equal ground; but now entrenched and rendered inaccessible by the strongest bulwarks of civil power; yet against all these obstacles christianity struggled, and completely triumphed. It overturned the temples and altars of the gods; it silenced the

"\* This month was added between February and March; and was done, when the corn would not be ripe at the Passover, nor the fruits at Pentecost."

"† The manner of reading the Law was as follows:—On Monday they began with that section which was proper for that week, and read it half way through; and on Thursday proceeded to read the remainder. On Saturday, which was their solemn Sabbath, they read the whole over again, both morning and evening. On week days they read it only in the morning; but on the Sabbath always repeated it in the evening, for the benefit of those who could not leave their work to attend the synagogues on week days."

"‡ The whole of the prophetic writings were not, like the Law, read over in public; but such parts only were selected for that purpose, as had a reference to the foregoing lesson out of the Law."

oracles; it humbled the pride of emperors; it confounded the wisdom of philosophers; and introduced into the most civilized nations of the world a new principle of virtue and religion. This extraordinary influence and authority it has maintained for nearly eighteen hundred years; it has been looked up to as the certain and unerring road, not only to present, but future happiness; and is still regarded by the wise and good, as a system founded by the gracious Saviour and Deliverer of mankind."

ART. XIV. *Abrégé des principales Preuves de la Vérité et de la Divinité de la Religion Chrétienne, par Beilby Porteus, Seigneur Evêque de Londres. Traduit de l'Anglois sur la septième Edition, et dédié avec permission à Monseigneur l'Evêque de Londres, par J. L. CHIROL, Pasteur à Londres. 12mo. pp. 164.*

THE original of this work is too well known, and too generally admired, to need our commendation and our praise. M. Chirol has performed no mean service to the public, by translating this valuable compendium with faithfulness and elegance, into a language more widely used than that in which it was originally composed; and for the

One defect pervades the volume: the want of references to the authorities upon which the writer has depended. Such references would have been of great utility, not only in confirming what the author has advanced, but in introducing others to the same sources of information as those from which he has himself drawn.

sake of the interests of christianity, we earnestly wish that its circulation may be as extensive amongst young persons upon the Continent, as the original has been among the young persons of our own island.

Some notes are added by the translator, which form a valuable addition to the text.

ART. XV. *The Mild Tenor of Christianity: an Essay. 8vo. pp. 159.*

THE advertisement prefixed to this little work, will exhibit the design, and something of the manner of the author:

"The design of this essay is to revert to the original departure from the simplicity and lenient character of the christian doctrine, and to pursue the deviating stream through all its wanderings till it was checked by the mound of reformation; and in the second part of this essay I propose to offer some remarks on the same deviating stream as it glides along with less aberration in its mingled state. This scheme involves a number of celebrated personages, whose characters will be surveyed under a new aspect.

"Next will be considered the more cultivated parts of British christianity; to which will be added, an account of some charitable institutions on the Continent, with a cursory life of Vincent de Paul, whose name is not familiar to the English reader.

"Some reflections will then be offered on controversial pulpit discourses, as hostile to the spirit of christian ethics; which naturally lead to a critique on the Master of the Temple.

"Some observations then occur relative to biblical expositions, with strictures upon the Reverend William Gilpin; concluding with remarks on the sombre morality of Dr. Johnson."

Conformably with this design, the author, with some appearance of order, has brought together much miscellaneous matter, illustrative of the mild genius

of christianity, when rightly professed; and of the bigotry and austerity which have characterised those who have mistaken its proper spirit. He begins by selecting passages from the scriptures to prove, according to his own too often inflated language, "that the emanative benevolence of the Father of the Universe rushes forward to all his children."—Page 3. From these he passes to the writings of the fathers, and to the origin of monkish institutions. Anecdotes are interspersed, of St. Anthony, Alfred, Peter the Hermit, St. Bruno, St. Bernard, and others. Approaching the reformation, he celebrates the virtues of Grosteste, Las Casas, and Wickliffe; and we are entertained with a specimen of the religious farces which were once in such great request. From the period which has elapsed since the reformation, the author has selected several eminent characters, who have honoured, by the mildness and excellence of their conduct, the faith they professed to maintain.—Amongst these we meet with the names of Sadolet, Montaigne, Vincent de Paul, Fenelon, Addison, and Rundle.

Our readers will be interested by the following account of Vincent de Paul:

"He was born 1756, in a village near the Pyrennees. He was educated at a monastery in the same village, and distinguished him-

self by a solicitude for the sick and indigent of his parish, and by a zealous desire of being employed in the distribution of the bread and meat which were given by the prior to the poor.

“ Having completed his studies and taken priest's orders, he was invited by a gentleman at Marseille to accompany him in a coasting voyage. Vincent embarked with his friend on the 22d of July: in this month, at Beaucaire, a town in the Lower Languedoc, is held a celebrated fair: the tents are erected along the side of the Rhone, and form a most picturesque view. The Gulf of Lyons, during the season of the fair, is commonly infested with Turkish pirates: our voyagers were unfortunately taken and carried to Tunis, where Vincent was sold to a fisherman; but his ill health inducing his master to part with him, he was bought by an elderly man in affluent circumstances, who led a retired life in the country, and devoted himself to chemistry: this was a situation more suitable to Vincent, who, having some knowledge of that science, became the favourite of the learned Mahometan. A short time elapsed, when Vincent had the misfortune to lose his indulgent master, who died in his journey to Constantinople, and, as Vincent informs us, partly of grief, in being obliged to relinquish his beautiful rural retreat and scientific pursuits, to amuse, with his experiments, the indolent hours of Achmet the First. Vincent now became the property of his late master's nephew, who immediately sold him to a Piedmontese who had turned Mahometan, and who farmed a tract of land belonging to the Grand Seigneur. These farms are called *temats*: Vincent says, the *temat* occupied by his new proprietor was a barren mountain, the cultivation of which was consigned to the labour of slaves. The wife of this apostate happening to approach the spot where Vincent was at work, and who was soothing his solitary labour with singing, she asked him what was the subject of his song; he replied, it was a hymn to Christ, a *noel*, or what we call a Christmas carol: she observed that her husband was once a believer in Christ, but that the holy prophet had breathed into his mind a more sublime belief. The zeal of Vincent was immediately kindled, and finding she understood the French language, he delineated with an eloquent fervour the character of the christian doctrine. The fair Mahometan seemed powerfully affected with what she heard, and, returning to her husband, reproached him for relinquishing a religion which appeared so amiable, and which seemed so happily adapted to the incitement of every virtue: ‘ If you have forgot,’ she said, ‘ all its holy injunctions, its benevolent precepts, its consolatory promises, go to your slave who is now at work, and he will bring them all back to your memory.’

“ This reproof, from so unexpected a quarter, appalled the Mahometan convert:

the religion he had abandoned, his country that he had deserted, his friends and kindred whom he had forsaken, rushed upon his mind: after having held several private conferences with Vincent, he formed a design of returning to Nice; and having bribed the master of a small vessel, he and Vincent happily escaped. His wife the year after attended some merchants to the fair annually held at Beaucaire, where her husband had agreed to meet her.

“ Vincent at his return to France was introduced to the illustrious family of Gondi, in the neighbourhood of Chatillon. The Countess of Gondi, with a corresponding zeal, promoted every charitable scheme, and assisted Vincent with ample donations in his benevolent pursuits: by the means of her generosity he instituted several female societies for the purpose of gratuitously attending the sick. In a few years were established on the estates belonging to the Count de Gondi thirty sodalities associated under the same benevolent direction. The fame of these institutes excited in several towns in Lorraine and Savoy an emulative desire of similar establishments; and it may be asserted with truth, that in many parts of Europe, at this day, the aged, the infirm, the sick, the dying, are visited, attended, relieved, consoled, in consequence of the active and ardent zeal which glowed in the breast of Vincent.

“ In the year 1629, he lost a valuable and powerful friend, the Cardinal of Berulle, who died while he was celebrating mass; on which circumstance the following lines were written:—

‘ *Cœpta sub extremis nequeo dum sacra sacerdos*

‘ *Perficere, at saltem victima perficiam.*’

“ Vincent found it proper to introduce some new regulations respecting his charitable endowments. Married women formed a great part in every house that was dedicated to the attendance upon the sick: domestic concerns frequently required their presence at home; and, after the first fervour had subsided, inattention and neglect ensued. The pious founder therefore ordained, that for the future unmarried women only should be employed. This ordinance gave new vigour to his institution: a great number of young women, free from matrimonial engagements, presented themselves, and (after a year's noviceship) ascertained their services by a temporary vow. Vincent divided this holy sisterhood into little societies, under the direction of an experienced person; these subdivisions were distributed over the province, to be in readiness to act whenever required. This was the commencement of that increasing association of the virgin daughters of charity, (*les filles de la charité*) which at length, like a healthful stream, flowed through the whole catholic continent.”

The design of this work is very laud-

able, and the execution, in general, worthy of the design. Some passages, however, occur, in which an attempt, at fine sentimental writing has produced, as it often does, mere rant and bombast.

ART. XVI. *A Letter to a Noble Duke, on the incontrovertible Truth of Christianity.* 12mo. pp. 88.

THIS is a republication of Mr. Leslie's Short and Easy Method with the Deists, "somewhat abridged and curtailed, and occasionally varied in point of language; especially with a view to divest it of every opprobrious controversial term, and every irritating expression of polemic defiance." As Mr.

Wrangham's abridgment of this very excellent tract was noticed in our last volume; we have now only to add our thanks to the present editor, for endeavouring to extend the circulation of one of the most demonstrative works we possess upon the truth of revelation.

ART. XVII. *An Enquiry into the Origin of True Religion; together with the Invention of Letters, and the Discovery of the most useful Arts and Sciences: wherein it is attempted to prove, that the Knowledge of these Things originated in the East; and hath been diffused amongst Mankind by various Channels, but chiefly through the medium of the Ancient Jews, and those Writings which relate to their Political and Religious Economy.* By the Rev. JAMES CREIGHTON, B.A. 8vo. pp. 51.

THIS little work appears to be the production of a well-informed and benevolent mind, deeply convinced of the value of the sacred records, and earnestly desirous that their value should be fully appreciated by others. The object of the author is very fully detailed in the title. A great number of interesting remarks are brought together, the result of much careful reading, but

not laying any claim to novelty. If the author has not proved all his positions, he has done enough to convince every impartial enquirer that the western world is under no little obligation to the eastern, and that the writers of Pagan Greece and Rome were indebted for many of their beauties and their excellencies, to those whom the former in particular, arrogantly denominated barbarians.

ART. XVIII. *Socrates and Jesus compared.* By JOSEPH PRIESTLEY, LL. D. F. R. S. 8vo. pp. 60.

THE comparison here instituted is eminently favourable, as might be expected, to the character of Jesus; who, though born in obscurity, and educated in a corner of the world, which the rays of science and philosophy had not illuminated, was, both in the manner of his public teaching, and the truths he communicated, much superior to the sage of Athens. Besides his inferiority in these respects, Socrates was a polytheist and an idolater; his notions concerning piety and virtue were far from being perfect; and in his knowledge of a future state, he was as deficient as the rest of his countrymen.

Great therefore as his character must be allowed to have been, that of Jesus was far greater: and hence Dr. Priestley justly thinks it impossible not to be sensibly struck with the peculiar advantage of revealed religion, such as that of the Jews and the Christians, in enlightening

and enlarging the minds of men, and imparting superior excellence. Much has been said of the *daemon* of Socrates, or that divine voice by which he asserted that he received supernatural intimations. It has been generally thought that in these instances he was under the illusion of fancy. Dr. Priestley, however, "though far from forming any fixed opinion on a subject of so great obscurity, thinks, considering the character of Socrates, and the tendency of these intimations, that it may admit of a doubt, whether they may not be supposed to have come, in whatever manner they were given, from God." p. 29.

This little tract, like most of the same author, contains many important observations; but, upon the whole, is less interesting than might have been expected, considering the subject and the writer.

## CONTROVERSIAL THEOLOGY.

ART. XIX. *Theological Institutes, in Three Parts: 1. Heads of Lectures in Divinity. 2. View of the Constitution of the Church of Scotland. 3. Counsels respecting the Duties of the Pastoral Office.* By GEORGE HILL, D. D. F. R. S. E. Principal of St. Mary's College, Primarius Professor of Theology in the University of St. Andrew's, and one of the Ministers of that City. 8vo. pp. 444.

THIS work is presented to the public as a specimen of the instruction, which the learned author has been in the habit of addressing, not, we are persuaded, without much good effect, to the students of his college. "It embraces three objects: the science to which those students profess to devote their attention, the ecclesiastical constitution of which they expect to be official guardians, and the pastoral duties which they may be called to perform."

The first part is merely an outline of a course of lectures, introductory to the science of theology. These lectures are arranged under the following heads: 1. Evidences of the Christian Religion. 2. General View of the Scripture System, and Plan of analysing it. 3. Opinions concerning the Son, the Spirit, and the Manner of their being united with the Father. 4. Opinions concerning the Nature, the Extent, and the Application of the Remedy brought by the Gospel. 5. Index of particular Questions concerning the Gospel Remedy, and of many of the technical Terms in Theology.

The following extract will shew the manner in which these lectures are conducted.

"The various sects of Christians, admitting the fundamental proposition that 'all have sinned,' agree in considering the gospel as a remedy for the present state of moral evil: but they differ in opinion as to the nature of the remedy; and their opinions on this subject are reducible to three systems, which we distinguish by the names of the Socinian, the Middle, and the Catholic.

"I. Socinian system may be learnt from Priestley.

"Forgiveness is freely dispensed to those who repent, by the essential goodness of God, without regard to the sufferings or merit of any other being.

"Jesus is the messenger of the divine grace, who declares that God is merciful the instructor of the world, whose death, although merely a natural event, was his testimony to all that he had said; afforded a bright example of every virtue; and paved the way for his resurrection, which confirmed the truth of the great promise of im-

mortality, by exhibiting to Christians a dead man restored to life.

"The gospel is understood to save from sin, because it is the most effectual lesson of righteousness.

"This simplest system concerning the remedy, cannot be received by those who believe in the pre-existence of Jesus; who have a strong apprehension of the evil of sin; and who form their opinion of the remedy from the language of Scripture: and it does not account for the powers said to be given to Jesus after his resurrection:

"II. Middle system may be learnt from Balguy's *Essay on Redemption*, Ben Mordecai's *Apology*, and *Price*.

"Although God is merciful, a distinction ought to be made between the innocent and the penitent. Jesus, by the merit of his sufferings, acquired a reward not merely personal, but the right of saving men from their sins, and of giving them immortality, John xvii. 2. Heb. ii. 9, 10. Acts v. 31.

"This system preserves the contrast marked Rom. v. 9. between the first and second Adam; exhibits an illustrious reward of transcendent virtue; and checks presumption, because penitents receive nothing upon their own account, the salvation of the human race being premial to the Redeemer.

"But this system involves the Arian opinion concerning the person of Jesus Christ: and, although beautiful and pleasing, yet, like many other theories, it proceeds upon a partial view of facts.

"III. Catholic system, so called because it has been generally held in the Christian world, enters into the creed of both the established churches of Britain, and is thus expressed in our confession: 'The Lord Jesus, by his perfect obedience and sacrifice of himself, which he, through the Eternal Spirit, once offered up unto God, hath fully satisfied the justice of his Father; and purchased not only reconciliation, but an everlasting inheritance in the kingdom of heaven.'

That the mode of teaching theology, which is pursued in these lectures, and which, with little variation, is generally adopted, is however the best, we feel something more than doubt: but we cannot too much admire, nor too strenuously recommend, the spirit of the lecturer, who thus addresses his students: "You will derive more benefit from can-

vassing what I say, than from imbibing all that I can teach: and the most useful lessons which you can learn from me are, a habit of attention, a love of truth, and a spirit of enquiry." P. 38.

The second part of this work contains a view of the constitution of the church of Scotland. As the subject is interesting, but we believe not very generally known, we shall endeavour to present to our readers a faithful abridgment of this part. Of the statement of facts which this portion of his volume contains, Dr. Hill observes, "I offer this general voucher, that I write upon a subject ultimately connected with my profession, and with the leading pursuits of my life; and that my brethren, who can easily resort to the authentic sources of information, would deem me unworthy of their society, if I were capable of introducing wilful misrepresentation into a didactic treatise." Pref. p. vii.

The church of Scotland is, of course, considered by its members as founded upon the principle of the primitive church, in which they perceive no distinction between presbyters and bishops. A body of presbyters having a moderator, who conducts the proceedings, and executes the sentences, is regarded as competent to perform all the acts which, in an episcopal government, belong exclusively to the bishop. It tries the qualifications of candidates for the office of the ministry; it confers orders by the imposition of hands; to those who are nominated by persons having right of nomination, it grants the investiture of the sacred office, or induction into the charge of a particular parish; and it exercises inspection and jurisdiction over the pastors of all the parishes within its bounds.

In the exercise of his spiritual functions a pastor acts within his parish, according to his own discretion; and for the discharge of the pastoral duties, he is accountable only to the presbytery from whom he received the charge of the parish; but in every thing which relates to *discipline*, he is assisted by lay-elders. These, like the deacons of the primitive church, attend to the interests of the poor. But their peculiar business is expressed by the name *ruling-elders*; in every question of jurisdiction within the parish, they form a spiritual court, of which the minister is moderator. In

the presbytery also they sit as representatives of sessions or consistories.

Ministers are admitted into a church by a presbytery. When a student has gone through his university education according to certain prescribed rules, he may be proposed to a presbytery, in order to be taken upon his trials; the consent of a superior court, called a synod, having been first obtained; to which court an appeal lies, if the presbytery should be oppressive. A person entered upon his trials, having obtained a licence to preach, is called a probationer; and in this character has no fixed charge, though he is allowed to assist a clergyman disabled by age or sickness. When he receives a presentation, he undergoes a second trial before the presbytery to whom the presentation is addressed: if they find that he is not qualified in respect of doctrine, literature, or moral character, their sentence declaring him unqualified, unless it be reversed by their ecclesiastical superiors, renders his presentation void. If, upon a vacancy in a living, the patron do not present within six months, the presbytery take such steps as they judge proper to supply the vacancy. None but *licentiates* or probationers, or those who have been previously inducted to another living, can be presented. The people have no right to elect a person to be presented to the presbytery; this right being reserved to the patrons, except when it is transferred by the patron to the parishioners. Yet the people are not overlooked; but have two ways allowed them of expressing their sentiments of the person who is to minister to them, either by subscribing or refusing to subscribe a paper, named a *call*, inviting him to be their minister; or by supporting a charge of immorality of conduct or unsoundness of doctrine. The former of these seems of little importance, as a *call* may be sustained, however small the number of subscribers. If no objection occur, the person is ordained, by imposition of the hands of the presbytery, who assemble at a time appointed for the purpose; the presentee having first answered the questions, and made the promises and engagements required by the law.

The lowest judicatory in the church of Scotland is the *kirk-session*, composed of the minister of the parish and of lay elders. New elders are chosen by the session, but are liable to be objected

against by any member of the congregation. If the objections be not valid, they are at an appointed time set apart to their office by prayer; having first declared their assent to all that is contained in the confession of faith.

A *presbytery* is composed of an indefinite number of parishes; in some populous districts of not less than thirty, in some more remote of not more than four. This judicatory consists of the ministers of all the parishes within the district; of the professors of divinity, if they be ministers, in any university that is within the same district; and of one elder from each parish. A moderator, who must be a minister, is chosen twice a year. At present there are 78 presbyteries in Scotland.

Three or more presbyteries, as the matter happens to be regulated, compose a *provincial synod*. There are at present fifteen of these judicatories, most of which meet twice in the year. This court is formed of every minister of all the presbyteries within the bounds of the synod, and the same elder who had last represented the kirk-session in the presbytery.

The next and highest ecclesiastical court is the *general assembly*. It is composed in the following manner: All presbyteries consisting of twelve parishes, or under that number, send two ministers and one ruling elder; all presbyteries consisting of eighteen or fewer, but above twelve, send three ministers and one ruling elder; all presbyteries consisting of twenty-four parishes, or fewer, but above eighteen, send four ministers and two elders; all of above twenty-four, but under thirty parishes, send five ministers and two ruling elders; and all that consist of more than thirty parishes, send six ministers and three ruling elders. The sixty-six royal burghs of Scotland are represented in the general assembly by ruling elders: Edinburgh sending two, and every other burgh one; and each of the five universities is represented by one of its members. The general assembly, therefore, is composed of two hundred ministers representing presbyteries, eighty-nine elders representing presbyteries, sixty-seven elders representing royal burghs, five ministers or elders representing universities: in all 361. In this assembly, the sovereign is represented by the lord high commissioner. This assembly meets annually in the month of May, and

continues to sit for ten days. But as it may be impossible, in that space of time, to decide all the questions that are brought before it, and circumstances may occur in the intervals between general assemblies requiring the interposition of this supreme court, a commission is annually formed of the general assembly: which differs from the general assembly chiefly in not being honoured by the representation of the sovereign, and may be considered as a committee of the whole house. Thirty-one members, of whom twenty-one are always to be ministers, constitute a quorum, which meets four times in the year, or oftener, for the dispatch of business.

These four courts are so constituted, that each inferior court is subject to the controul of its superior. The power of the superior court may be exercised at its own pleasure, upon reference from an inferior court, and upon appeal or complaint. In matters purely ecclesiastical, the civil power does not interfere with these spiritual courts; but in every question of a civil nature, such as respect glebes, &c. the decision of a presbytery is cognizable by a civil judicatory.

The judicial power of the church of Scotland appears in the infliction or removal of such censures as are thought to belong to a spiritual society. The objects of these censures are gross immorality, heresy, and schism. The minister of the parish has no power of this nature, but as a member of the kirk-session: and he again is subject to no control less than that of the presbytery by whom he was ordained, and by whom alone he may be suspended or deposed. The nature of these censures, and the method of inflicting them, are defined in a code of laws, confessedly imperfect, called the form of process.

General laws were formerly made and repealed by the general assembly alone. The barrier act enables an individual to propose to the presbytery new laws, or the amendment or repeal of old laws. Such proposals must be transmitted to the general assembly, and by them are either dismissed, or sent to all the presbyteries for their approbation. The result is returned to the next general assembly, and passes into a standing law, if not less than forty presbyteries have approved. To prevent the delay which must thus be occasioned, the general assembly, if it thinks fit, can order the proposed measure to be ob-

served as a law, during the term which intervenes between its first being proposed, and the rejection or confirmation of it by the presbyteries at its succeeding meeting.

The church of Scotland receives annually from the exchequer of that country, 2000*l.* Of this, 500*l.* are set apart for the salaries of the procurator and agent of the church, the law-officers, clerks, &c.; and the remaining 1500*l.* for the defraying of the expences incident to the dignified station of the representative of the sovereign in the general assembly. Emoluments are also annexed to the offices of his Majesty's chaplains for Scotland; and the deans of the chapel-royal. The stipends of the ministers arise chiefly from the teinds or tythes, paid either in money or in kind by the titular of the teinds, who is not always the landholder, but in some cases the crown, in others an individual or a corporation. The landholder in Scotland enjoys a privilege in respect of the payment of tithes, which is not known in other Christian states: he may value his teinds before a court of session; and that valuation being established, how much soever the rent of his lands may rise by the improvements of agriculture, &c. the increase is entirely his own, because the teinds never go beyond the rate at which the valuation had fixed them. The landholder, if he be not titular, as is frequently the case, may compel the titular to sell the teinds

to him: excepting where the teinds are held by the crown, or when they have been granted for the support of public institutions. If the titular does not pay the whole of the teinds, according to their valuation, to the minister, the court of session may grant an augmentation, but never beyond the quantity or sum fixed when the teinds were valued. Besides the teinds, the minister of every country parish is provided with a dwelling house, or manse; with a garden; with a glebe of not less than four acres of arable land; with grass for one horse and one cow, and with the out-houses necessary for the management of his small farm. By another legal provision, called the ann, the half-year's stipend that becomes due after the death of a minister, is paid to his widow or executors.

We have thus endeavoured to exhibit to our readers, in the most succinct manner, the constitution of the church of Scotland. It has its excellencies and its defects both in theory and in practice; but upon neither do we feel ourselves here required to offer any remarks.

The third part of Dr. Hill's work, which contains 'Counsels respecting the Duties of the Pastoral Office,' though designed for the Scottish clergy, may be read with great advantage by those within the pale of our own establishment, and by the regular teachers of dissenting societies.

**ART. XX.** *Letters to Mr. Fuller on the Universal Restoration, with a Statement of Facts attending that Controversy, and some Strictures on Scrutator's Review.* By WILLIAM VIDLER. 8vo, pp. 157.

THE author of these letters is very well known to those who pay any attention to controversial divinity, as the zealous advocate for the doctrine of universal restitution, which Mr. Winchester preached with much success some years ago. In the year 1793, Mr. Vidler received from Mr. Fuller what he considered a *private* letter, occasioned by his having openly avowed this doctrine. This letter was in 1795 published, without Mr. Vidler's knowledge, in the Evangelical Magazine, a periodical publication which was not open to a defence. Some time after this, Mr. Vidler began to publish a monthly work, called The Universalist's Miscellany, which is still continued under the title of the Universal Theological Magazine. In this he

offered to conduct the controversy, and several letters were accordingly published by both parties. Mr. Fuller's letters were afterwards printed separately, and soon occasioned, as was most probably designed, a violent tract, called, "Letters to an Universalist, containing a Review of the Controversy between Mr. Vidler and Mr. Fuller, on the the Doctrine of Universal Salvation." The writer signed himself *Scrutator*, being ashamed, as Mr. Vidler conjectures, and as he certainly with reason might be, "to put his name to the effusions of his anger." The work before us contains the letters which were written in answer to Mr. Fuller, and which, in fairness, ought to have been published at the same time with them.

We shall not attempt to enter into the merits of this controversy. Mr. Vidler has reason on his side, though not all the scriptures which he has pressed into his service. We do not mean by this to insinuate, that the doctrine of eternal punishment is a doctrine of the scriptures, but that inferences against it are here drawn from passages which belong to a very different subject. We have long been of opinion that the greatest immediate aid that Universalists can derive from scripture is, the absence of every thing adverse to their opinion, and that it is in vain for them to look for any positive evidence in their favour. The New Testament, wherever it has any reference to the future state of the wicked, does not contradict their hypothesis; and all that it teaches of the character of God, and of his moral government, is decisive in its support. These letters are written with great ability, and what is better, with a truly liberal and christian spirit. Even they, who might perhaps question the soundness of his principles, would, we think, be compelled to acknowledge that in one, at least, of the virtues of the gospel, the writer is no mean proficient: he can return good for evil, and, when reviled, withhold himself from reviling again.

The temper of those with whom Mr. Vidler has chiefly to contend, will be seen from the following passage.

“It is a maxim pretty generally allowed among Calvinist churches, that Error is

worse than vice. This maxim was publicly avowed at the association of the particular Baptist churches at Chatham in Kent, 1793. At that assembly I was publicly excluded from their communion for believing and avowing the doctrine of the restitution of all things. The moderator, when he had pronounced the sentence of excision, added, ‘I am constrained to say, that your moral conduct has been such as would do honour to a much better cause than that in which you are engaged.’ And the minister who preached on the occasion to a very crowded audience, said, ‘The universal doctrine is an heresy, and every one who holds it is an heretic; not that every heretic is a wicked man; for heretics are often the holiest of men; but heresy is more dangerous than vice; for if a wicked man is sound in the faith, there is some hope of him; such are often recovered; but as for heretics, they are very seldom recovered from their errors.’—There were near thirty Calvinist ministers of different denominations present, and only one of them disavowed the sentiment that was so publicly taught. I have from that time to this been treated with the utmost contempt by many nominal Christians of loose characters, who have been taught that the holiest of men may be heretics, and that heresy, though attended with holiness, is worse than vice!!! The enormity of this maxim appears in its full view when it is recollected, that by error and heresy we are not to understand a departure from Christianity, but a departure from Calvinism.”

Whilst such is the conduct of men who profess to be christians, who can wonder that the name of Christ is still “a stone of stumbling, and a rock of offence?”

ART. XXI. *Methodism Inspected. Part I. With an Appendix, on the Evidences of a State of Salvation.* By WILLIAM HALES, D. D. Rector of Killesandra. 3vo. pp. 94.

IT is much to be lamented that persons who profess so much zeal for religion, and who devote themselves so laudably to the reformation of that class of the community, which is considered by the generality of teachers as below their notice, should be so much under the influence of fanaticism, as essentially to injure the cause they appear desirous of serving; and while they lessen the quantity of moral evil, do, all in their power to render the gospel, and the profession of it, contemptible in the eyes of the sceptic and the unbeliever. The little treatise before us, was composed in consequence of the extravagant and indecorous conduct of the methodist missionaries, in that part of Ireland in

which the author resides. The censure which is here passed upon them, with a spirit becoming a christian minister, is no other than they most justly deserve; and if their minds were open to conviction, they might here learn how unscriptural are their doctrines of complete freedom from sin, experimental freedom of divine favour, and positive assurance of forgiveness. They might also be taught the folly of expecting sudden conversions, and the indecency of those violent agitations of body which they encourage the deluded people to exhibit.

The author has selected from some of Mr. Wesley's works, particularly from a letter written to Maxfield, one of his

early apostate preachers, some excellent remarks, which ought to be carefully studied by those who with a zeal, not guided by knowledge, are "turning the world upside down."

ART. XXII. *A Vindication of Scriptural Unitarianism, and some other Primitive Doctrines: in Reply to Vindex's Examination of an Appeal to the Society of Friends.* By VERAX. 8vo. pp. 124.

THIS work does not strictly correspond with the title. It ought to be considered as a defence of the author's former tract, in which he endeavoured to prove that the founders of the sect of friends, and the early defenders of its doctrine and practice, were Unitarians. We have here, therefore, not a regular vindication of scriptural unitarianism, which we were prepared to expect, but a revisal of the passages which had been selected from Penn,

Barclay, Fox, Penington, &c. for the purpose of shewing their opinions concerning the person of Christ, and the authority of the scriptures. In many of these there is great obscurity, and we confess ourselves unequal fully to decide between Verax and his opponent. We are therefore disposed to say with our elder brother, the rustic critic Palæmon,

*Non nostrum inter vos tantas componere lites;  
Et vitulâ tu dignus et hic.*

ART. XXIII. *The Divine Logos; or Jehovah Elohim the only proper Object of Christian Worship.* By JOHN BENTLEY. Small 8vo. pp. 164.

A POMPOUS little book, from which the reader will derive the clearest conviction that Mr. Bentley is at least a smatterer in Hebrew. He may also, perchance, be amused with the changes which are here rung upon the affected titles of Elohim, Dabar Elohim, and Ruach Elohim; and he will doubtless be astonished at the penetration of an author who confidently assures us, that "the intelligent Hebrews always considered the term Elohim as implying Jehovah, the Dabar, his only son, and the Ruach, his Holy Spirit." And that the priest pronouncing his blessing upon the people, in which the term Jehovah occurs thrice, at the same time

"disposing his fingers into a certain form, acknowledged the Holy Trinity." When Mr. Bentley ventures upon such flights as these, his fears are very natural that in the hands of "the gentlemen reviewers, he shall resemble the partridge when he experiences the fraternal embraces of the hawk; that one will seize upon a leg, another upon a wing, and not a feather escape them." From us, however, this mystic bird has nothing to fear. We shall not interrupt his playful mazy flight, as we have no relish for the picking of bones, from which so little is to be gotten, and that little so hard of digestion.

ART. XXIV. *A Short and Practical Account of the Principal Doctrines of Christianity, for the Use of Young Persons. To which are added suitable Prayers.* By W. J. REES. 12mo. pp. 43.

THIS little tract was drawn up by the author, to assist his parishioners in their preparation for the rite of confir-

mation; and it may be useful to others, who are required to observe the same ceremony.

### SERMONS AND PRACTICAL THEOLOGY.

ART. XXV. *Sermons by WILLIAM LAWRENCE BROWN, D. D. Principal of Marischal College and University, Aberdeen, &c.* 8vo. pp. 491.

THE author of these sermons has been long known, and highly and deservedly esteemed. All that the public has yet received from him, has been received with pleasure, and excited a favourable expectation of all that was to

come. The highest expectation will here be gratified. Treating upon the most useful subjects, eminently distinguished by soundness of argument, eloquence of style, and an intimate knowledge of the human heart, these dis-

courses form a valuable addition to this interesting and important branch of English literature.

This volume contains eighteen sermons, upon the following subjects :

I. On the duty and character of a christian preacher. (Preached at the author's admission to the west church, Aberdeen.) II. On the love of God. III. On the joy and peace of believing and practising the gospel. IV. On the nature, the causes, and the effects of indifference with regard to religion.— (Preached before the society for propagating christian knowledge in Scotland.) V. On the folly of procrastination with regard to the concerns of religion. VI. On the vanity of religion, unless considered as the chief good, and accompanied with zeal and perseverance. VII. On the nature, the effects, and the rewards of constancy and perseverance in religion. VIII. On the progressive nature of religion in the soul. IX. X. XI. On prudence and simplicity of character. XII. XIII. XIV. On Agar's prayer. XV. XVI. On pride. XVII. On humility. And XVIII. On the unfailing nature of charity, as a motive to cultivate it. (Preached for behoof of a society, instituted for the relief of the sick poor, and entitled, "The sick man's friend.") Of these, though some are undoubtedly more excellent than others, there is not one which does not contain many important truths, illustrated and enforced by a vigorous and commanding eloquence. We could, with pleasure, justify this assertion, but we are compelled to limit our quotations. We cannot, however, refrain from presenting our readers with the following : In the *third* sermon, amongst many other satisfactory observations, designed to rectify the erroneous opinions which are commonly entertained with respect to the moral obligations of christianity, Dr. Brown says ;

" In fact, the religion of Christ contains no absurd or irrational doctrine, and no precept, but what is founded on the nature and relations of man, and perfective of his happiness. If, rejecting the superstitious fears, and enthusiastic dreams of ignorant and misguided christians, we examine the sacred scriptures themselves, we shall find, that, by the laws of the gospel, as well as by the frame of nature, their common author has annexed happiness to virtue, and misery to vice ; that he has prohibited only what is repugnant, and commanded only what is con-

ducive to our real welfare ; that our religion never designed to extinguish, but merely to regulate our original propensities ; and that, within the bounds of nature and of reason, we are still allowed to gratify them. We shall find, that every doctrine of the gospel has a most salutary tendency in either leading us to the right knowledge of our condition, inspiring us with exalted ideas of the Christian scheme, or engaging us to virtuous conduct by the most generous and cogent motives.

" Though we be Christians, we may cultivate our understandings, refine our imaginations, indulge our natural and social affections, nor be entirely insensible to personal and selfish enjoyments. Though we be favoured with divine instruction, we are not denied the benefit of human learning.— Though the book of revelation be laid open to us, the book of nature is not closed to our eyes. Though we be chiefly required to attend to the beauty and excellence of the moral character, the order and symmetry of material objects are not withheld from our observation. Though we be adopted *into the household of faith*, our relation to the great community of mankind, much less to those more immediately committed to us by providence, is not dissolved. Though we be expectants of heaven, this does not preclude our acting in our present capacity of inhabitants of this world.

" In reality, when we honestly employ the means adapted to the advancement of our temporal prosperity, we also *work out our eternal salvation* ; or, in other words, the most eligible methods of promoting the one will contribute to excite and confirm in our minds the joyful expectations of the other. Engaged in the business of our particular calling, and faithfully discharging the duties of the station allotted us by providence, we are, at the same time, serving God. Providing with integrity for our families, and gratefully bettering our circumstances, we are also qualifying ourselves for an *inheritance incorruptible, undefiled, and that fadeth not away, reserved in the heavens*. Recommending ourselves to the esteem and friendship of our fellow-men, we are thereby forming our souls for *the society of angels, of the general assembly and church of the first-born, and of the spirits of just men made perfect*. Preserving, by wholesome refreshment and moderate exercise, the health and vigour of our bodies, we are equally recreating and invigorating our minds for rational and spiritual pursuits, and thus preparing them for a more refined and exalted state."

Whilst the believer feels the truth of the following animated passage, the man of taste must admire its eloquence :

" These are joys pure and substantial, suited to the dignity of the rational nature ;

and independent of our brutal part. These can never be carried to excess, never succeeded by corroding reflexion. Pleasing once, they please and delight us for ever. These neither birth, nor external events, nor the dispositions of men, nor disease, nor age, can affect. They attend us in society, and forsake us not in solitude. When enemies persecute us, they inspire us with courage, and endue us with strength. When false friends abandon us, they remain. They solace adversity, and enhance, and adorn prosperous circumstances. They lighten the burdens of life, and disarm death of his terrors! Compared with these affluence is poor, grandeur is contemptible, sensual pleasure is disgusting. External circumstances are appropriated to no inherent dignity of character, and are, often, the means of debasing it. But, religious and moral enjoyments are the peculiar privileges of the wise and good, who are not excluded from their share of worldly possessions, and can enjoy them with the highest relish. Still, should these be withheld, supported by their internal resources, by conscious integrity, by the exhilarating sense of the divine favour, and by the glorious prospect of a blessed immortality, the piously wise must, even in adversity and affliction, be possessed of a more abundant store of happiness than can belong to the impious and wicked, placed on the summit of power, basking in the sunshine of prosperity, and resounding the loudest strains of dissolute mirth. Like a rock towering above the deep, the man of piety and virtue beholds the storms of calamity roar around him, without shaking his resolution, or impairing his strength. When the tempest assails those of a contrary character, they are tossed, like the sand, from surge to surge, and when the calm returns, sink under the weight of their own depravity!"

The fourth discourse, delivered on a particular occasion, is worthy of being recommended to general attention.—The following passages we cannot withhold:

"The present age values itself on the improvement of elegant art, on the cultivation of literature, and on a general civilization of manners. The desire of knowledge pervades even the vulgar; and a certain species of refinement is every where conspicuous. Thousands, however, who affect the philosophical spirit, and a high degree of philanthropy, despise religion, as unsuitable to elegance of mind, and acuteness of understanding. But, can any thing be more absurd, than to enquire into every other cause, and to exclude the Supreme? Can any thing be more irrational, than to discover and admire the curious structure, and the nice adaptation of means to ends, displayed through every part of nature, and to receive no impression of the original Contriver?

Can any thing be more inconsistent, than to be alive and sensible to every species of created symmetry and beauty, and to be utterly callous to the spotless perfection of the creating and governing mind? Can any thing be more degrading, than to esteem and honour every display of human genius, wisdom, and benignity, and to be insensible to the source from which even those are derived, *the Father of lights, the Author of every good and perfect gift?* The mountain, hiding its snowy head in the clouds; the river rolling its irresistible current, swelled with all the waters of heaven; the boundless expanse of ocean; the raging agitations of the tempest—these are grand and sublime objects, which affect the most stupid and unfeeling heart! But, what are these, in comparison of Him *who counteth the nations, as the small dust of the balance; who taketh up the isles as a very little thing; who stretcheth out the north over the empty space; and hangeth the earth upon nothing?*"

In accounting for the indifference that prevails with regard to religion, Dr. Brown very judiciously remarks:

"To the prevalence of this disposition, the attacks, made by sceptics on Christianity, have contributed in a manner which I recollect not to have, hitherto, seen remarked. In conducting the deistical controversy through all its branches, much acuteness of intellect, and copious stores of erudition, have frequently been requisite. But, while the truth of religion was evinced, its power and energy over the heart were, in some measure, suspended. Every appearance of warmth was avoided. Zeal was considered as blinding the understanding, as precluding impartiality, as leading to a degree of animation prejudicial to the cause of truth, as expressive of an intolerant mind, which the enemies of religion were so prone to charge on its professors. The coldness, which is peculiar to scepticism, was communicated to those who were engaged in combating it, by detecting the fallacy of sophistical argument. The species of contest, which it was necessary to maintain, introduced into the minds of many rational Christians a certain argumentative insensibility. Though those, whose faith was built on the firmest foundations of evidence, had the strongest grounds of attachment to our holy religion, yet, the tone of their religious feelings was reduced, and a speculative and theoretical belief was sometimes allowed to take place of *that faith which is the substance of things hoped for, and the evidence of things not seen:* that faith, which purifieth the heart, worketh by love, and overcometh the world. The glow of piety, the spirit of devotion, the energy of holy zeal, were chilled by the process of abstract intellect, and the affections, deprived of their proper objects, were allowed to subside into lethargic indifference. As, in those

times, when the rage of controversy, prevailed among Christians, zeal for doctrinal points diverted attention from the admirable morality of the gospel; so, the logical warfare with sceptics tended to superinduce a cold, speculative, phlegmatic habit, which excluded, or at least impaired, that justly proportioned zeal for religion which ought always to animate its professors.

"By these remarks I mean no reflexion on those able defenders of Christianity, whose irresistible arguments have triumphantly repelled the attacks of deists, and to whom the Christian church owes indelible obligations. But, to every human work some imperfection unavoidably adheres, and I am convinced that the cause just now stated, has, in some degree, contributed to produce that listless profession of religion so prevalent in the present times. While the understanding was occupied in defending its truth, the heart was perhaps less affected by its intrinsic excellence and beauty."

What Dr. Brown observes of pride is not more eloquent than true:

"Pride commences with our life, grows with our growth, and spreads through all our conversation and conduct. She accompanies us through every stage, condition, and circumstance of our terrestrial course. She intermingles with almost every action we perform, and every pursuit in which we engage. She attends us to the grave, in all the pomp, solemnity, and expence of funeral. She engraves her ostentatious inscriptions on the stone that covers the mouldering body, and, when that body is incorporated with its original dust, and these *words of vanity* are no longer legible, she attempts, by escutcheons and pedigrees, and genealogical legends, to perpetuate the name which wisdom had, perhaps, consigned to oblivion. This is, more or less, the foible, this the deformity, this the deep-rooted vice of all mankind. Pride appears in the cottage, as well as in the palace. She sits on the workman's bench, as well as on the monarch's throne. She struts driving a flock of sheep, as well as marching at the head of a victorious army. One great cause of wrath, and contention, and rancour among men, is, whose pride has a right to indulgence; who is entitled to that pre-eminence, of which both parties are, perhaps, equally unworthy; and who is authorised to vindicate that superiority at which all aspire, but which the generality refuse to every one, but themselves?"

With the following pathetic passages, we will, reluctantly, conclude our selections. It occurs in the last discourse.

"Ye, who enjoy every convenience and comfort of life! to whom, when you are laid on a bed of sickness, every soothing aid, every help of medicine, every relief that money or tenderness can supply, are provided; reflect how you endured the pains and languors of disease, though mitigated and softened by all that human art or kindness could devise! Did you happen to be removed from your abode, when some severe and dangerous malady assailed you, how were you overwhelmed by the absence of domestic charity and convenience? But, the poor man has no home for sickness! Health is necessary to procure him ordinary comfort, is necessary to provide him and his family with the means of daily subsistence.—Laid on the bed of languishing, perhaps on the bed of death, he beholds his wife and children, disconsolate around him. They can present to him none of the cordials and supports of sickness; for his interrupted labour deprives them of the staff of life. His distress and theirs are unknown to the ear of opulence. The rich, or those who employ him, recognise him only by the price of his labour. When fixed to a sick-bed, which serves rather to augment, than to alleviate his malady, he ceases to attend his work, he ceases also to be present to their minds. Another comes, occupies his place, receives the wages he used to earn,—and the sick man is forgotten! Disease continues to prey upon his frame, till he expires! He is consigned to the grave of difficult purchase, and to oblivion, or is remembered only by the beggary of his family, often accounted unfortunate and troublesome!"

Before we close our account of this valuable volume, we must notice the inaccurate use of the particle *that*, for *since*, or *seeing that*, or *because*. "This question," observes Dr. Brown, "is the more necessary, that, from mistaken notions with regard to the subject of it, have proceeded, &c." p. 26. A similar passage is to be met with, p. 266.—These are indeed only minute blemishes, but they are such as all who read these discourses, with the same pleasure that they have afforded to us, will wish to have removed.

ART. XXVI. *Sermons preached occasionally in the Episcopal Chapel, Stirling, during the eventful Period, from 1793 to 1803, by GEORGE GLEIG, LL. D. & F. R. S. E.* 8vo. pp. 424.

THESE sermons are twenty-one in number. In an advertisement prefixed, the author disclaims all expectation of increasing either his fortune or his fame by the publication of them. He hopes, however, "that they may be read, as he was assured they were heard, with some advantage."

Two leading objects appear to occupy the preacher's attention, through nearly the whole of these discourses: the first, to combat certain fanatical preachers, whom Dr. Gleig describes as having gained great influence in the northern part of this island; and the second, to expose and to censure that system of modern philosophy, the prevalence and success of which he attributes to a determined conspiracy against christianity, of the *illuminati* aided and abetted by what he considers as its genuine offspring, the French Revolution. The late war, therefore, he praises, as just in its principles, and necessary for the preservation of religion and social order: and he denounces all those who have maintained a contrary opinion, or held the propriety of any reform in our government, as levellers and anarchists, zealous only to overthrow the happy constitution of their country. We shall not take upon ourselves to animadvert upon the accuracy or the candour of this representation, or to decide on the legitimacy of all the inferences drawn from it. Secluded from the busy world of political debate, we have heard at a distance the loud acclaim of the justice, the necessity, and the glorious tendency of former wars, the secret springs of which have been afterwards laid open; and the ostensible have been proved to be not the real motives by which the actors in the bloody scenes were moved. To war-preachers, therefore, we would recommend more moderation; and to them no less than to all other polemics we would suggest this truth, that to make an argument prove too much is exceedingly to weaken its force.

Of the fanatics against whom Dr. Gleig declaims, of their principles and their success, he thus speaks:

"In an age which has witnessed a whole nation renouncing the faith of Christ, and when the religion of all Europe has certainly waxed cold, this doctrine is peculiarly dan-

gerous; and yet I believe it never was propagated among us with more zeal than at present.

"While the more intelligent teachers of religion in both parts of the united kingdom, supinely suffer things to take their course, without exerting one effort to stem the torrent of infidelity which threatens to overwhelm us—a set of absurd and self-commissioned fanatics wander over the country, "creep into houses, and lead captive silly women," and sillier men, by assuring them, that Christianity requires of them nothing but what they call *faith*; that what moralists term the duty of subjects to their sovereign concerns not them; that the love of their country is no virtue, but perhaps a vice; that the precepts of morality are but the elements of a legal institution; and that they shall certainly be saved, if they firmly believe that Jesus Christ died for the elect, and that they themselves are of that happy number.

"Thus is this nation likely to be lost with others, not by the arms of its enemies, but by the false principles of its members; by the irreligion of some; the lukewarmness of many; and the mistaken notions of Christianity entertained by those who appear by their conduct, compared with that of others, to be the only party actuated by zeal."

If the following picture of our northern youth be not too highly coloured, we agree with the preacher that we have reason to be alarmed at our situation. But we hope these have been contemplated by him through the same magnifying medium that has enlarged and rendered terrific the other objects of his animadversion.

"Of our young men bred to the liberal professions, two-thirds at least are avowed infidels; and indulge of course, without compunction, in the practice of every vice which fashion has not made dishonourable, and of which the laws of their country take no cognisance. In proof of this heavy charge, I might refer you to those impious and immoral books which daily issue from the press, and are bought and read with astonishing avidity. But to enumerate these would be little better than to mingle poison with your own cup; and for such a hazardous proof there is the less necessity, that one cannot mix at all with the world without finding my position fully verified. Nay, so prevalent is fashion, and so infatuating example, that we find professed infidels at every table; and no man can be sure that the stranger who sits next to him shall not,

before he rise, break an impious jest on the object of his adoration.

"The presence of a clergyman is still some restraint, in this respect, on the tongue of good manners: and yet, within these two months, I heard one of the greatest ornaments\* of this, or any other country, pronounced a party man, because some of the company had observed that he was a Christian! Men of lay-professions meet much more frequently with instances of this kind than clergymen can be supposed to do. A friend of mine, whose veracity cannot be doubted, assured me, that of thirty young men composing a literary society, of which he was a member, there were but three who had the courage to profess themselves Christians. A few more declared their belief in the existence of God: but a very great majority were avowed atheists.

"Whence, now, can we suppose such extreme depravity of principle to have arisen? From calm inquiry and from the pursuits of science? No! Calm inquiry, on scientific principles, always leads to truth; and he† who possessed perhaps the profoundest mind that ever actuated a human frame, and made greater progress in the pursuits of science than any man had ever done before him, was likewise one of the firmest believers in the doctrines of the gospel.

"The young men whom I have mentioned as calling themselves atheists, had never thought seriously on the subject of religion: they had probably seen their parents and guardians, who professed Christianity, neglect its ordinances, disregard many of its precepts, and show a perfect apathy with respect to all its threats and all its promises. It was, therefore, not unnatural, for youthful minds to infer that the faith of such persons, if they had any faith, fell short even of that which the apostle attributes to those beings, of whom he declares, that 'they believe and tremble.' But, from thinking thus of the religion of parents and guardians, persons to whom every one is accustomed to look up with reverence—it is a very short step for a young man, ardent in the pursuits of pleasure, to conclude, without inquiry, that all pretensions to revelation are impostures upon mankind; and that the Old and New Testaments are a collection of fables."

In a sermon preached on the fast-day, 1797, both the higher and the lower orders of our community are thus heavily charged.

"In the last century the natives of this island, after piously recommending themselves and their country to the God of battles, united with ardour under an usurped government, which most of them justly abhorred, to repel the threatened invasion of an insulting foe: but at the present awful crisis, when all the powers of Europe, that have it much in their power to annoy us, seem leagued for the destruction of every thing dear to us as men and as Christians; some individuals of the higher orders of society are exerting all their influence, and all their power, to distract the attention of government, to rend in pieces the force of the empire, and to deliver up their countrymen—nay, themselves, their wives, and their children—gagged and bound, to a host of murdering atheists. Others again, though not so far lost as this, to all sense of what the world calls honour; yet "forgetting the God of their salvation, and the rock of their strength," plunge heedlessly into the excess of dissipation, and trust the defence of every thing which ought to be dear to them to the arm of flesh.

"Nor are the principles and practices of the lower orders among us more consonant to our holy religion than those of the higher. Our peasants and mechanics, instead of looking to persons of the same station in other countries, and comparing their own happiness with theirs, which would fill their breasts with gratitude to God, and with a cheerful submission to the laws of their country, turn their eyes upwards with stupid malevolence to the splendour of their landlords, and such other persons as occupy stations superior to their own; and, being stung with envy, are eager to pull them from those elevations which, in the present state of things, they cannot themselves hope to reach. Hence that impatience of government, and those wild clamours for political reformation, which pervade all the lower orders of society, may be traced to the single source of envy engrafted on ignorance; envy of the imaginary happiness of their superiors, and ignorance of this obvious truth, that had they no superior in the state, they could never have acquired the wealth which they now enjoy."

We must, however, do our author the justice to observe, that when his mind is not heated by the contemplation of the speedy destruction of all social order, he frequently reasons with precision, calmness, and effect.

† Newton.

ART. XXVII. *Sermons on several Occasions.* By the Reverend R. SHEPHERD, D. D. Archdeacon of Bedford. 8vo. pp. 348.

THE volume here presented to the public contains thirteen sermons, and a charge delivered to the clergy of the archdeaconry of Bedford. The four first of these discourses are on the ground and credibility of the christian religion; the three next, on the evidence of a future state, afforded by reason; the eighth on the influence of example, and the causes which mislead the multitude; the ninth the fear of God; the tenth on the power of conscience; the eleventh on inspiration, and the means by which it may be discriminated; the twelfth on a former paradisaical state; and the thirteenth on the character of Charles the First, and of the causes which led to his death; preached at Oxford on the 30th of January.

The character of these discourses is not uniform; those which relate to the evidences of the christian religion are, upon the whole, worthy of the serious attention both of the believer and of the sceptic. The arguments, if not always new, are in general well arranged, and forcibly stated; the observations are frequently good, and sometimes excellent; yet, in the midst of much solid reasoning, we meet with positions which tend to destroy the effect of the previous arguments, and to increase the scepticism which it is the preacher's object to remove. Thus, discoursing upon the miracles of Christ, he justly observes,

"The manner also, in which these and his other miracles were wrought, was such as added a strong corroborating argument to prove them both real and divine. They were not performed in secret, they were not performed before a few credulous or interested witnesses, a circumstance which might have left them liable to the suspicion of imposture; but openly, before a multitude of enemies, as well as friends, at the most public festivals, and in the most frequented places of resort. They were performed also with the same sort of action with which Almighty God created the world; by a FIAT, by a bare word or intimation of his will, without gradual process, or visible means or instruments. In appeasing a violent tempest, he says only, *peace, be still*: immediately the obedient winds hearken to his voice, and the agitated sea subsides. In curing an inveterate leprosy, he says no more than—*I will, be thou clean*: and the leper is suddenly cleansed.—No sooner does he say to the deaf and dumb man, *Ephphatha, be opened*; than his ears are opened, and the string of his tongue

loosed. He restores also to life both the widow's son, and Lazarus, by saying, to the one, *arise*, to the other, *come forth*. Once or twice, indeed, he employs natural means in his operations, but they were manifestly so ineffectual in their nature to the purposes for which they were employed, and designedly so, as conducted only to magnify the power of the performer: who in those acts communicated to certain forms of matter, by an efficiency nothing short of divine, powers and qualities, which in their own nature they did not possess. Add to the whole this finishing circumstance, that his miracles produced always a durable and permanent effect. If the ears of the deaf, or the eyes of the blind, are opened, they continue afterwards clearly and perfectly to hear or see. If the dead are raised, they continue to perform all the functions of life; and remain incontestibly standing witnesses to the reality of what was done in their favour."

But the force of this passage is much lessened by one in which it is allowed, that evil spirits may work miracles, and that "we cannot be certain, but that some phenomena which appear, and are really to us miraculous, have resulted from their agency."—Page 26. It is true, the preacher lays down some criteria, by which these may be distinguished from miracles wrought by the immediate agency of God; but if in any instance we admit Beelzebub to have the same power as Jesus, we diminish, if not destroy, the argument, upon which our Lord himself was willing to rest the proof of his divine mission; but Dr. Shepherd has not yet learnt what a miracle is, or he would never have conceived it possible for any but the Great Author of Nature to work one.

In the sermons on a future existence, there are many strong arguments well advanced, and many passages which display a feeling heart, and a correct judgment; yet we cannot by any means agree with our author, when he asserts, "that in the present life there is more evil than good, and that virtuous conduct does not encrease individual happiness;" nor can we admit the validity of his reasoning, from the example of the thief on the cross, the situation and sentiments of whom Dr. Shepherd has totally misunderstood.

In these discourses on future existence, Dr. Shepherd appears to be embarrassed by what he apprehends to be the

scripture doctrine of a future day of general judgment. He cannot believe that the soul sleeps till the day of the resurrection: he considers it as the doctrine of scripture, that the soul departs to her appointed future station, immediately after death; but in common with many other divines, he limits the happiness which the virtuous are to enjoy, though it must be necessarily spiritual, till the union between the mouldered dust and the never dying soul shall have again taken place. For our own parts, we confess that this hypothesis has ever appeared to us replete with difficulties. Does the language of scripture indeed teach a future general judgment? Are not the terms usually considered as referring to such an event, in truth to be interpreted as relating to a very important occurrence already long past? In a work written by the late Mr. Cappe, and which we noticed in our last volume, this hypothesis was started, and appeared to us worthy of consideration, as likely to remove difficulties of which all theologians hitherto, whether they have ventured to confess it or not, have been fully sensible.

Before we came, in our progress through this volume, to the sermon preached at Oxford on the 30th of January, we found reason to suspect that Dr. Shepherd is one of that class of churchmen (daily, we hope, diminishing) who regard moderation and candour as virtues which they are not called to exercise. As we perused this discourse, our suspicions were fully justified. Dr. Price and Dr. Priestley here meet with more than their usual share of obloquy, and the ecclesiastical gunpowder of the latter is by no means forgotten. "If there be those," thunders forth our preacher, page 307, "who with the dark spirit that conducted the operations of the infamous Vaux, openly exult in a texture of well conceived, and resolutely pursued machinations which will blow up our boasted constitution," &c. &c. and as though his readers were ignorant of the much misconceived and misrepresented passage to which he here refers, he adds this note:—"Dr. Priestley seems to have had Vaux's plot in his eye, when, to excite the spirited efforts of his coadjutors in the work of anarchy and confusion, he assures them, they were wisely placing, as it were, grain by grain, a

train of gunpowder," &c. &c. Men who resort to such charges as these, must surely be fond of mischief, and conscious of their total want of persuasive argument, or convincing facts; and all such we would advise, when they again bring forward this "tale of terror," to relate it in the words of the late Dr. Geddes:

Non aderas, Priestley! potior te cura tenebat

Rure, ubi magna inter centum miracula rerum,

Horslæi caput in rutilantia fulmina forgis;

Sulphuris et satagis subtilia grana parare,

*Church quibus et churchmen, in cælum upheavere possis.*

In page 304, we meet with a charge of a more serious complexion. "In some periods of the last century," Dr. Shepherd asserts, "when on several trying occasions the bishops and episcopal clergy made their noble stand against popery, it is well known, and ought never to be forgotten, that the dissenters held back, or were privately bargaining with that party for indulgence." We hesitate not to assert, with more than equal confidence, that this is *not* well known, and that the preacher has here been guilty of uttering a gross and unfounded libel. Is the arch-deacon of Bedford then so little read in the civil history of his country, as not to know who took a principal part in bringing in the families of Orange and of Brunswick? Has his eye never glanced over the page which records the *jacobitism* of churchmen, whilst the chevalier was maintained and patronized by our rival on the eastern side of the channel? Has his attention never been arrested by the tale of the patriotism of those whom he reviles; who, in times of public danger, from the enemies of liberty and the protestant cause, when they, who lived upon the state, and were bound to defend it, deserted their duty, nobly and disinterestedly came forward, and performed the most important services; for which, instead of claiming honours, *they were compelled to sue for pardon*? But it is an old doctrine, that truth, faith and justice may, with impunity, be violated, when a heretic is to be silenced; it is a doctrine which the arch-deacon seems highly to approve, and, perhaps conscientiously, to practice.

ART. XXVIII. *Practical Discourses.* By the Rev. RICHARD WARNER, Curate of St. James's Parish, Bath. 8vo. pp. 245.

OF the design and character of these discourses, a more correct or fairer view cannot be exhibited, than in the preacher's own words:

"The term practical discourses, (applied to all the following ones, except those on the evidences of our holy religion) is intended to designate a series of sermons, founded on the precepts, rather than the pretended doctrines, of the New Testament; whose object it is to develope and enforce the obligations of moral righteousness, and not to discuss points of useless speculation, nor controverted articles of faith. They were written, preached, and, I hope, are calculated, for every description of christians; for all those who believe the divine mission of Jesus Christ; who consider his religion more as a rule of conduct, than as a bone of contention; and hold practical piety and holiness of life to be of greater importance to themselves, and of higher value in the sight of God, than the most bigotted attachment to any forms of mere human invention; or the most zealous devotion to any creeds fabricated by the ingenuity of uninspired men.

"Whatever wild enthusiasts on the one hand, or worldly divines on the other, may conceit, assert, or write to the contrary, this I must continue to think, as long as my faculty of ratiocination remains unclouded—that christianity, according to the spirit and letter of the gospel, is a system neither veiled by mystery, nor involved in difficulty, as the former would lead mankind to imagine; nor is it essentially and exclusively associated with any particular form of liturgy, system of establishment, or modification of government, as the latter would suggest."

The spirit which dictated this passage is conspicuous in every part of the volume, so far as believers in the gospel are concerned; but towards those who admit not the divine origin of christianity, the author indulges in language by no means consistent with his avowed candour. Almost the whole of the first discourse is occupied in declamation against unbelievers; and is more like the production of an angry petulant controversialist, than of a grave and sober-minded divine. We agree with Mr. Warner, that the unbelievers are generally "unfair and uncandid in their conduct, with respect to their attacks upon revelation;" but we cannot assent to these unqualified assertions, that they are "under the influence of principles and prejudices vicious and perverse, base, wicked, and contemptible;" that they uniformly

"scorn to attend to the evidence which proves the authenticity of the christian revelation;" and that their infatuated conduct can be accounted for upon no other principle, than that it springs from a secret dislike to those restrictions which christianity commands, and those virtues which it enjoins. "The features of christianity, so beautiful and so new, so worthy of infinite wisdom to suggest, and of infinite purity and goodness to command," we gladly acknowledge, "form a proof in favour of the divinity of christianity;" but we will not, we dare not say, as Mr. Warner does, "such a proof, as nothing less than judicial blindness, can be inattentive to; a proof that no man can deny or reject, whose taste for moral beauty is not entirely extinguished, whose understanding is not wretchedly weakened by the malignant influence of sin, whose judgement is not marvelously infatuated by the witcheries of vice, and whose power of discriminating between truth and falsehood is not altogether obliterated." To such sentiments, and to such expressions as these, we strongly object; they are not agreeable to the spirit which christianity recommends and enjoins, nor to that which the founder of christianity so carefully exhibited; they are not becoming in the christian preacher, nor adapted to abate the prejudices of those who receive not the gospel.

In other parts of this volume, we occasionally meet with declamation of a more innocent nature, but which leads us to question, not the author's charity, but his taste.

"Let, therefore, the elegant apologist," says the preacher, "for the glittering profligacy of classical worship pour forth all his cloying eloquence in the praise of the mildness of Polytheism; let him exercise all his sarcastic subtlety in endeavouring to lessen the sufferings of the christians, and to extenuate the cruelty of their gentile persecutors."

So in page 184, we read "of dangers that were lately distant, *approaching our shores by speedy approximation*;" and in page 192, of "the coldness and inattention of the worshippers of the *awful eternal essence*."

Mr. Warner is also chargeable with the use of words for which no authority

can be produced, and which no well-formed ear can tolerate. Thrice, at least, the term *concerning* occurs as a participle: the *concerning* truth of a future judgement, page 81, a short axiom *concerning* in its substance, page 128; and in page 187, we read, "in a *sorry* manner indeed, would the ministers of the gospel fulfil the *concerning* duties of their profession, &c."

In page 165, we are told, "that we must be content to sit down in disappointment, though not in *disconsolation*;" and, in another place, "the cottage of the labourer is the residence of *disconsolation* and want." If we had not met with such an unusual application of words, we should have supposed *mortal* to have been inserted in the following passage by some mistake on the part of the printer: "Is it not criminal in him to make this difference a plea for withdrawing from his brother *mortal* love and charity?"

Having, in the faithful discharge of our duty, thus freely censured, we turn to the more pleasing part of our office. We can sincerely recommend this volume, as containing a brief, but well arranged, and ably executed view of some of the leading proofs of the divine origin of the gospel. Notwithstanding the occasional blemishes which we have noticed, these discourses are upon the whole well written, and contain many passages very forcible and eloquent. The volume is composed of nine sermons. The *first* is introductory to those on the evidences of christianity; the second is on the evidence arising from prophecy; the third on the evidence arising from miracles; the fourth on the internal character of christianity; the fifth on the evidence arising from the propagation and establishment of christianity; the sixth on the necessity of practical religion; the seventh on the christian spirit; the eighth a fast sermon preached during the last war; and the ninth a thanksgiving sermon on peace.

As a specimen of the information and pleasure to be derived from these discourses, we present our readers with the following:

"But the beneficent character of our Saviour's miracles is not the only attestation of an heavenly origin with which they are impressed, and of the consequent truth of the system which he taught. Their number and their magnitude point to the same conclusions. They inclined the thinking party, even amongst the Jews, in spite of their general erroneous notions respecting the Messiah, to hesitate whether our Saviour might not be considered as that promised personage. 'When Christ cometh,' say they, 'will he do more miracles than this man hath done?' And if impartially investigated and seriously attended to, they must have the same effect upon every reflecting mind of the present day.

"Turn to the sacred pages which record the wonders that he worked, and behold all nature subject to his power. The winds of Heaven fly to do his pleasure, and the raging of the sea subsides at his command. He wills the change, and immediately the simple element is converted into wine; and plenty is produced in the barren wilderness. He says, let there be light in those eyes which have been blind from their birth, and there is light. He says, let the tongue be untied which nature had bound down in silence, and instantly it is unloosed, and sings hosannahs to the Son of David. The devils themselves tremble at and obey the voice of Christ; at his word the evil spirit relinquishes the object of his malice; and the poor possessed wretch who was lately writhing under the agonizing paroxysms of demoniacal phrensy, is now seen in his right mind, sitting at the feet of his compassionate deliverer, and listening to the gracious words that fall from his mouth. Even the dead hear the command of the Son of God, and awaken from their deep repose. At his omnipotent word the last enemy disgorges his prey; the daughter of Jairus feels the genial tide of life return; the son of the widow of Nain, rescued from the cold embrace of death, is again restored to his weeping mother; and Lazarus, starting from the bed of corruption, acknowledges the power and beneficence of the Lord and Giver of life."

ART. XXIX. *Sermons preached to a Country Congregation. To which are added, a few Hints for Sermons, intended for the Use of the younger Clergy.* By WILLIAM GILPIN, M. A. Prebendary of Salisbury, and Vicar of Boldre, in New Forest. Vol. III. 8vo. pp. 456.

NO style of composition is attained with more difficulty by a man of learning, than that which prevails in the work now before us; yet no one is of equal importance to those who are situ-

ated as Mr. Gilpin is, or indeed to preachers in general. Plain, yet not inelegant; level to the meanest capacity, and yet pleasing to a person of most cultivated taste; adapted to a congregation,

composed of "hewers of wood and drawers of water," and possessing attractions that would be felt in the court of a prince, or the school of a philosopher. In this style we cannot conceive of a greater proficient, than the vicar of Boldre; and we strongly recommend these discourses to the frequent perusal and the careful imitation of the younger clergy, especially of those who reside in country villages. We do not know any thing of the history of Mr. Gilpin's parish, but we are disposed to believe that no ignorant fanatical declaimer can have gained a hearing there. If they who "wander about from house to house, speaking the things which they ought not," have infected the parish of Boldre also, the worthy vicar must be singularly unfortunate in the flock over whom he presides. Twenty-five sermons are contained in this volume; twelve of these are upon the truth of the christian religion, the rest are upon miscellaneous subjects; such as—the poor in spirit; communing with our heart; the children of the world; faith, hope, and charity; the widow's mite, &c.

From the following quotations, the character of these discourses may be justly drawn:

In the second sermon upon the words of the apostle, 'let every one that nameth the name of Christ, depart from iniquity,' Mr. Gilpin observes:

"In the first place, let us consider how disreputable it is to act unsuitably to our profession. Even in common matters, in the business of this world, it is disgraceful. He who professes an art, or calling, and appears totally ignorant of it, is justly thought contemptible. You know how discreditable it is for a man to take a farm, for instance, when he knows not how to manage it. He sows wheat where he should sow barley. His grounds are ill prepared for either; and his neighbours see him carrying into his barn a plentiful crop of weeds, intermixed with his corn. They laugh at his ignorance. He feels it, and is ashamed.

"Now, if our feelings were as strong in matters of religion as they are in the matters of this world, (and it is a grievous thing, and much to be lamented, they are not) we should think it as contemptible for a christian to fall short of his profession, as for a man in any kind of business to be ignorant of that business. A christian's proper distinction is a holy life. He does not pretend to have more genius, or more learning, than a Turk or a heathen; but he professes to be more chaste, more sober, more just, more charitable, more pious, and more resigned.

And if he fail in these, he deserts the art he should live by. He is a mere pretender, plainly unskilled in his proper profession."

The exordium of the *sixth* discourse afforded us much pleasure:

"We often rest satisfied with a fair outside. To be born in a christian country—to make a public profession of the christian faith, and to lead a life unstained by any notorious sin, is enough to make a good christian. If other people consider us in this light, (and we are very candid to each other) we are ready enough to take our religion on trust.

"There is a fashion in religion, as in every thing; and if we are in the fashion it is well. In ancient times, when men strictly followed the rules of the gospel, a different kind of religion was in fashion; and such people as now often pass for good christians, would then have been considered as *shameful men*. A man may now freely indulge the pleasures of life: he may give the world his heart: he need not trouble his head with the intention, the conditions, the promises, or the threatenings of the gospel, and yet he may be thought a very decent christian: he may be like his neighbours: he may be in the fashion.

"In little matters all this is well. In the trifling affairs of life, we may conform to the manners and customs of the world: we may suffer fashion to make a change in our cloaths. But, for God's sake, let us consider that religion is exactly the same now it ever was: it admits no fashion; and if we take our measures of it from what we commonly see practised in these declining days, we may call it christianity, if we please; but we may just as well call it any thing else. It is, in general, no more like christianity, than a modern man of fashion is like an apostle."

To such passages as these, and of such chiefly is the volume composed, we give an unqualified praise; but truth compels us to censure the worthy author, for having, in one instance at least, suffered his faith to overcome his charity. In the twenty-second discourse, speaking of future punishments, after having quoted some of those passages of scripture which are commonly supposed to relate to that subject, he asks,

"How are we to interpret *these* passages? Are we to conceive them as expressing only some long period of time; or are we to consider them in a literal sense? and that their meaning is, that future punishments are really to last for ever?

"Many people, it is true, have been led (but I apprehend chiefly by their own wishes) to consider them in the former sense. I own, I see no grounds for such an opinion from any rules of interpretation that I know."

And again he observes,

"Or are we to consider future rewards as eternal, and future punishments as temporal, though the very same word is used to express both? This, no doubt, in the opinion of many people, would be the most commodious way of interpreting scripture; but whether it would be most agreeable to the just rules of interpretation, I much doubt."

We must be allowed to express our surprise, that any one who considers properly the character of God, the nature and design of his moral government, the condition of the constitution of man, and the idioms which prevail in the language of scripture, should strenuously contend for so dreadful a doctrine as never-ending torments, reserved

for the wicked. And we cannot refrain from expressing our deep and sincere regret, that a christian minister should himself feel, and endeavour to infuse into the minds of others, such uncandid and unchristian sentiments concerning those who cannot be induced to maintain the same principles. No one, surely, who speaks thus harshly of all who do not doom the frail and erring creatures of a day to everlasting and remediless woe, can have read the pious, the benevolent, and the able work of *Petit-pierre*!

The hints for sermons are, in general excellent, and may be used by the younger clergy with much advantage.

ART. XXX. *Sermons composed for a Country Congregation. By the Rev. EDWARD NARES, A. M. Rector of Biddenden, Kent. 8vo. pp. 410.*

OF a character very different from that of the preceding article, is the volume now before us. Composed with the same view, and preached, we suppose, in similar situations, there are no points in which the discourses agree. In the one prevail chasteness and simplicity of diction, not without much elegance; in the other there appears consciousness of superiority, ill disguised and imperfectly concealed by poverty of sentiment, and meanness of expression. Mr. Gilpin is a country clergyman, who without any restraint, or any violation of the most polished manners, can talk to his parishioners upon equal terms. Mr. Nares is the gentleman of high breeding, who seems to be out of his proper sphere when not in the drawing room, and who stoops with difficulty and awkwardness to converse with a villager. His discourses justify the remark we have already offered, respecting the difficulty of addressing the less cultivated classes of society, and demonstrate the necessity under which country clergymen ought to consider themselves, of studying the models of this most useful style of pulpit composition, exhibited by the vicar of Boldre.

In condescension, no doubt, to the vulgar capacities of his rustic hearers, Mr. Nares does not scruple to violate the plainest principles of English grammar: thus, in page 26, he says, "to a second, perhaps, *who* she sees striving hard to raise himself above his fellows, religion will cry out, to *humble* himself, &c;" and in page 272, "turn then to the idle he

thinks it better to *set* in the sunshine and sing." How judicious the preacher, who striving, we suppose, to become all things to all men, thus accommodates his style to the unpolished minds of an illiterate congregation! "The poor man will be cheerful and gay; the sick man patient and full of hope; the lowly, humble and submissive, *and so on.*"—Page 145. Again, "We must allow it to be pardonable, while they are *not taught better*; but few are so destitute and forlorn, as to have no aged friend belonging to them who should *teach them better*. The sin must rest with these if they take no pains to *teach the young better*," &c. What the lowest of his village hearers could have written, the lowest must certainly have understood.

Serious as was the subject, we much doubt whether the preacher did not excite a smile even amongst his rustic parishioners, by the following most pathetic passages: "And first, to weep for the dead, is very natural indeed, *for we are of course left behind to lament their loss!* They are gone and have left this troublesome world; and, alas! have left us to struggle through the difficulties of it *unfriended and alone!*" And again, "Weeping and grieving are very painful and distressing!"

From the same principle, we suppose, of accommodation to the prejudices and the ignorance of the unlearned, Mr. Nares misinterprets the language of scripture. "Jesus, (he observes, page 352,) existed before the tempter, through whose seductions our first parents fell.

This also, in no obscure terms, he intimates himself: *I beheld Satan, says he, as lightning fall from Heaven.—Luke x. 18!* The whole passage in which this occurs we recommend to the reader's notice, as an admirable specimen of the *bathos* or art of sinking; a finer descending climax we do not recollect ever to have seen, excepting indeed that the order is in one instance violated: Christ is said to have existed *before Abraham, before the temple, before David, and before John.*

These may serve to demonstrate the truth of the observations with which we opened this article. The volume abounds with similar marks of the want both of judgement and of taste. From the following quotation, however, the reader will be induced to conclude, that if Mr. Nares had not mistaken the nature of the composition best adapted to a country congregation, he would have produced discourses not only more worthy of the public eye, but more likely to please and to benefit a country audience:

“But, though it may seem more remote, the liberties we take with our lives, through a wanton abuse of health, is not less irrational, or more to be defended. There are many excesses men run into, the certain effects of which are well known to be, the positive destruction of health, and a premature bringing on of decay and decrepitude. Because it does not happen that life is apparently brought into immediate danger by every

single act of intemperance, we are heedless of remote consequences. But since life is now known to be a state of trial, it should be considered as a post of duty we have to maintain, and which we have no right to abandon till we have a regular dismissal from him who placed us in it. If the fabric of our mortal bodies is so constructed as that by care and management they may reasonably be expected to last *‘threescore years and ten,’* so much we may conceive to be the common term assigned for our trial and probation, and what right can we have to abridge it? But, if by intemperance and excesses we hasten the termination of life, undoubtedly we in effect do withdraw from our post, contrary to the original will and design of him who appointed the common limits of human life. It matters not when we destroy life, if we do but unnecessarily hasten its destruction.—Besides, it is not allowable to think, that life is not always exposed to danger, in every act of excessive indulgence; surely many have been known to die in the midst of their pleasures; many have been as suddenly hurried out of life by the intoxicating bowl, and other gross irregularities, as by the sword of the duellist, or the murderous arm of the suicide. Great is the error then, and most dangerous the mistake, of fancying our health and our lives to be our own; of which, as we have no account to render here, we can have none to render elsewhere; indeed of no two things, perhaps, shall we have a more formidable account to render; since, as it has been shewn, the wanton abuse, and deliberate exposure of either, are connected with some of the foulest crimes, and most disgusting immoralities.”

ART. XXXI. *Sermons upon Subjects interesting to Christians of every Denomination.*  
By THOMAS TAYLER. 8vo. pp. 455.

The subjects of these sermons are more interesting than the sermons themselves, we apprehend, will prove. The preacher has done little to attract and to fix the attention: he has delivered plain truths in a plain manner, and addressed himself to the judgement, rather than to the feelings; but whatever may be the general opinion of these discourses, they will prove, without doubt, acceptable to the members of the church and congregation of protestant dissenters in Carter-lane; to whom they were formerly delivered, and are now dedicated, and with whom the author has had, as he himself says, “the honour and happiness to be connected for more than thirty-six years.”—The following subjects are here discussed in twenty sermons: The moral government of God; accountableness to God for our religious opinions; genuine religion distinguished from that which is counterfeit; the superior excel-

lence of the righteous; the wisdom of doing every thing in its proper season; the present our only state of trial; the duty and obligations of religious worship; the divine authority of the christian sabbath; the piety and fortitude of Daniel; Daniel's miraculous deliverance; the authoritative manner in which our Lord delivered his doctrine; the perfect purity of our Saviour's character; the crucifixion of our Lord; the conduct of the disciples in deserting their master; the duty and obligations of imitating Christ; the peculiar affection which christians owe to each other; and Jonah's gourd.

The following extracts will afford a specimen of the author's manner:

In the second sermon, upon being accountable to God for our religious opinions, he observes,

“The most upright minds, in this frail state of flesh and blood, cannot always, by

any methods which they are capable of adopting, certainly secure themselves from falling into error. They may not enjoy the proper means of information; or, they may labour under innocent prejudices, even upon very interesting subjects, which will as unavoidably darken the eye of the mind, as a film, or a disorder of the nerves, does the eye of the body. And God, we may be sure, will not charge that, upon any man as a crime, which ought really to be considered as his calamity. The censure, now intended, does not extend to the involuntary, and unavoidable mistakes of a humble, upright, teachable mind, who wishes to know the path of truth and duty, and diligently uses every mean in its power to find it. A person of this excellent temper, has no hing to dread from the sentence of his merciful and righteous judge. No, Sirs, such serious and impartial inquirers, may look up to him with an assured hope, that their unwilling mistakes, shall never be brought in charge against them. It is indolent and superficial inquirers, who are so enamoured with the pleasures, and profits of this world, that they care not what judgment they form upon religious subjects; it is the proud and self-confident, who are so vain of their own knowledge and penetration, that they refuse to accept the assistance of that wisdom which is from above; in fine, it is men of corrupt minds, whose judgment is blinded by evil prejudices and passions, to whom the guilt of error belongs; and upon whom, even the knowledge and belief of the truth, confers no praise."

In a discourse upon religious worship, the preacher observes:

"We live in an age, when the ordinances of religious worship have undeservedly lost much of that respect and veneration, in which our pious ancestors held them. By some, it is pretended, they are not expressly

enjoined; and by others, that they do not need them. One man thinks it sufficient, if now and then, when a convenient opportunity offers, and no other engagement lies upon his hands, he pays a complimentary visit to the house of God; and another thinks he has fully discharged his duty, by attending there once a day; the remaining hours, he supposes, may be very lawfully given up to his own disposal. But I would ask persons of this description, what have you, or your fathers found in God, that you should be thus sparing and reserved in the time and labour you devote to his worship? You are lavish enough of both, in all other pursuits and engagements; and why so niggardly here? Is God so liberal in his grant of mercies; and can you think it grateful or just, to be so scanty and contracted in your returns of duty and praise? or, will you review such a waste of sacred time with approbation, and pronounce it wise, when eternity, with all it's interesting scenes, is just opening to your view? Admitting, for a moment, that the public worship of God, is not expressly enjoined; (though I know not how that can well be supposed) yet, surely, a just sense of our immense obligation to him, will lead us to consider it as an indispensable duty. And since it is good for us, in every way that we can adopt, to draw near to God; we should lose no opportunity that offers for approaching him. The obligation of an express command, should not be thought necessary here: the duty recommends itself, by it's own reasonableness and importance."

From these quotations our readers will be able to form some judgment of the style and manner of the author. The seriousness and piety which prevail in these discourses, must have rendered them beneficial to those who heard them, and they cannot be read without producing some similar good effects.

ART. XXXII. *Practical Sermons on several important Subjects. By the Reverend THEOPHILUS ST. JOHN, LL.B. pp. 394.*

IN an advertisement prefixed to these sermons, we are informed "that they have already been printed in imitation of manuscript." We are also informed of the occasion of their having been thus printed. "A bookseller of great respectability represented to the author, that sermons, resembling manuscript, were offered for sale by different writers. He therefore requested his friend to print some in the same manner, in the persuasion that they would put a stop to what he termed, such disreputable traffic. That end being soon answered, the bookseller ceased to advertise and disperse them." Of his intentions in

offering them to the public, the author thus speaks: he hopes "that they may not be altogether useless," and "he entreats the reader to consider them as sermons calculated for a popular auditory, such as a clergyman, ardently desirous of doing good, would write for the use of his congregation." With this character these discourses correspond. They are impressive, serious, pious, and liberal. They are twenty-six in number, and chiefly practical. As a whole, we were particularly pleased with the *twenty-second* sermon, on the *uncertainty of life*; and we shall not do our author wrong, by submitting to the

reader the following quotation from it, as a proper specimen of his manner.

“So slender is the thread by which the principle of life is sustained, that it is often cut by the most trifling accident. How many, blessed with the most robust constitutions, catch disorders, which, though imperceptible in their origin, and disregarded in their progress, are fatal in their termination? How many come into the world with the seeds of disease implanted in the habit, which wither and consume the body that contains them? How many fall a sacrifice to their own rashness, to the obstinacy, nay sometimes to the indiscretion and levity of others? How many, employed in business, or amused with innocence, from which, as danger is not perceived, so it is not apprehended, are cut off by the visitation of God? In a word, the food we eat, the air we breathe, the raiment we wear, the ground we tread upon, all are instruments in the hands of Providence to execute his will, and hasten our dissolution.

“Now, if we are always ‘encompassed with so many and great dangers;’ if we are, every moment, liable to such inevitable and fatal attacks, will not prudence dictate, and wisdom recommend the method adopted by ‘the meekest of the sons of men,’ to beseech him ‘in whose hand are the issues of life and death, so to teach us to number our days,’ that whether we are arrested by ‘the pestilence that walketh in darkness,’ or wounded by ‘the arrow that flieth in the noon day,’ we may fall like men not ignorant of the danger, and not unprepared for the event?”

Of the preacher’s seriousness and deep concern for the good of those who are entrusted to his care, the first discourse, *On the respective Duties of Minister and People*, furnishes ample testimony: the following passage is not the least impressive.

“Besides preaching the word of God faithfully, every minister of a parish is to visit his congregation, and administer consolation to those oppressed with sickness, or bowed down with infirmity. Agreeable to the seventy-sixth canon—‘When any person is dangerously sick in any parish, the minister or curate, having knowledge thereof, shall resort unto him, or her, to instruct and comfort them in their distress.’ Believe me, christians, to visit the sick is the most affecting, the most awful part of a clergyman’s duty. Can you conceive the agony of our minds, when we visit any of our flock struck with sickness, and discover them totally ignorant of religion, and uncertain of their salvation? The first thought which occurs to us is, can the ignorance of this poor wretch be attributed to his want of religious instruction? Is it owing to my neglect, that he knows so

little the state of his soul? And should his sickness end in death, when the bell, by its solemn toll, acquaints us, that his race is run, can we hear it, do you imagine, with unconcern? When we are assembled to perform the last sad office, and to deposit his ashes in the silent grave, we cannot help putting this awful question to ourselves: when I meet the soul which lately inhabited that breathless body, at the tribunal of God, shall I meet it with confidence, or dismay? If it be received to happiness, am I the blessed instrument of its happiness? If it be doomed to misery, can its misery, either through neglect or inattention, be laid to my charge? For this soul I know I am to answer; can I appeal to God that, if it has perished, it has perished through its own fault?”

In proof of his liberality, we shall give the following short extract from the same discourse.

“Some are of opinion, that the gospel is seldom delivered in its genuine purity in the church, and therefore, instead of attending its worship and service, go to other communions, where they receive, or fancy they receive, more edification. If by deserting the church they are made better men than by attending it; if they are better husbands, better fathers, better neighbours, better christians, for to become such I suppose to be their motive—‘go, and the Lord be with you.’ But give me leave to add, if the teachers you follow should be mistaken: if they should ‘deliver for doctrines the traditions of men;’ if they should teach you to trust on a broken reed; if they should mislead you in so important a point as salvation; how will you blame your obstinacy, your folly, your infatuation, for believing their doctrines, without having strictly examined their truth, and fairly weighed their tendency? ‘Believe not every spirit, but try the spirits,’ with impartiality, ‘whether they be of God.’”

Concerning the speculative system which the preacher has adopted, and here supports, it comes not within our province to deliver freely our opinion. The worthy author shall speak for himself.

“So irretrievably were we lost by the transgression of our first parents, that there appeared to the eye of Omniscience no other way of restoring us to a state of favor and happiness, than by his uniting in the person of Jesus Christ, our human to his divine nature. To save man, God himself becomes man. Hence we see of what value we are in his estimation: though but ‘sinful dust and ashes,’ we are thought worthy of redemption by him who ‘breathed into us the breath of life.’”

Again,

"When our first parents had eaten of the fruit of the forbidden tree, and renounced the protection of infinite goodness; when, by their disingenuous revolt from the lenient command of their Creator, they had brought sin into the world, and communicated its effects to all their posterity, death: when the whole world was in wickedness, and alienated from God by wicked works; then it was, when there appeared no way to escape, that the justice of heaven required satisfaction, and a sacrifice was demanded to free us from eternal death: Christ voluntarily

became that sacrifice for all the fallen rebellious race of Adam, and, by offering up himself immaculate—"without spot or blemish"—reconciled a world of sinners to his offended Father."

We shall not be thought unreasonable if we acknowledge that we felt some difficulty in reconciling these different accounts of the person of Christ; whether this inconsistency be apparent or real; whether it be chargeable upon the preacher, or upon his system, we leave to the decision of others.

ART. XXXIII. *Essays and Sermons on select Subjects. To which is added, a Discourse on the Nature of the Christian Religion.* By JOHN BUDDO, A. M. Preacher of the Gospel. 8vo. pp. 81.

THIS little volume is introduced to the public, in the following strange and incoherent manner:

"All such as wish not to get rid of fair examination, find that religious belief is perfectly compatible with the clearest and most enlightened understanding. To take away a national church, by consecrating liberty, equality, reason, is as rank enthusiasm, as the notion which sets up persecution. Luther and Calvin were men, and consequently liable to the like imperfections as others. But it is evident, that they were friends to the most important interests of Christianity, and made it their endeavour to bring back mankind to that liberty where-with Christ hath made them free."

After reading this, our expectations rose not very high; but we gladly confess that we were pleasantly disappointed.

We found, as we advanced, many plain and serious remarks; sometimes, indeed, expressed in quaint and inelegant language, but frequently very forcible, and of useful tendency. The volume consists of two essays: 1st. on the being, the providence, and the attributes of God; and 2d, on a future existence and state of retribution: of three sermons, 1, on the love of God; 2, on the love of our neighbour; and 3, on the christian's hope and character: and of a discourse on the nature of the christian religion. This last is only republished, being the first impression tacked on to the preceding articles.

The author appears to be a man of piety, and they who object not to orthodoxy of opinion, may read this little volume with advantage.

ART. XXXIV. *Sermons chiefly designed to recommend the Practical Morality of the Gospel, and intended for the Use of Family Devotion.* By a LAYMAN. 8vo. pp. 317.

THIS volume, which consists of 23 sermons upon various moral and practical subjects, is the production of one who is evidently what he styles himself, "a lay friend to social and religious order:" one who feels the influence, and enjoys the consolations of religion; and benevolently wishes to diffuse, as widely as possible, these invaluable treasures. The volume opens with a serious and well-written discourse on family devotion, which contains many convincing arguments to recommend the practice of that neglected duty. Its importance to the order and harmony of a family, and its beneficial effects upon every member of the domestic circle, are here ably stated, and cannot, we think, fail to make a

due impression upon the mind of every serious and considerate person.

Laudable as is the zeal which has contributed to the appearance of this volume, we are truly grieved that we cannot unreservedly commend the execution. If it were composed of such passages as the following, it would be indeed a valuable work:

"My dear children, the same benevolent hand which restored this poor beggar to sight brought you into being, and sustains you at this moment;—the same parental eye that watched over you at the dangerous moment of your birth, now sees your tender hearts;—you have suffered the attacks of sickness incidental to your tender frames, and have been restored to health and to the enjoyment

of all around you—it was the same kind providence that guarded your trembling spirits, and bid you live again in the bosom of your anxious parents. The hand of him who made us is upon us, and directs our way;—to that God who gives and who takes away, who has prepared for you all the comforts you enjoy, and blesses your little minds with innocence and tender love; to him let me lead your gentle spirits; and while I press you to my bosom and implore his mercy for you, let me urge you to be ever mindful that he is the kind parent of your parents, that he is the most affectionate friend of your friends, and the supreme director of those who direct you: to this parent and universal benefactor open your beloved hearts—make his name and his goodness to you familiar to your minds, by the prayer which Jesus Christ his Son hath directed us to teach you:—as he is kind to you in giving you life and every blessing, so be you kindly affectionate to each other as good children of so good a Father;—as you cannot know the extent of his providence, so learn to receive with meekness and without discontent every accident that happens to you—and as you have been taught that his great power and mercy is over you and guides your innocent and unwary steps, so learn to put your trust in him, who has power to uphold you, to comfort you, and to place you in the bosom of endless happiness!

“As you grow older and the world opens upon you, you will stand in more need than at present of his sure direction; then when the dangers of pleasure or prosperity, or your engagements in the world, or the period when you shall be called upon to act for yourselves shall arrive, then look up to that God who now cherishes and supports you, and he will be your parent, your counsellor and your friend—he will guide you through thorny paths, and place you in smooth ways; he will save you in troubled waters, and bring you to a happier shore;—he will direct you how to choose the better part which others cast away, and to dwell in the habitations of pleasantness and peace, rather than in the tents of ungodliness and misery!”

But such passages as these are rare. There is scarcely a sermon which is throughout adapted, as the title of the volume leads us to expect, to the character of a family circle: and such an unhappy failure of an ill-judged attempt at fine writing we scarcely ever wit-

nessed. We read, p. 9. “that the Jewish monarchy was founded on *the ruins of a combination of theocracy, idolatry, and fear;*” p. 11, “that Jesus *emanated* the Holy Spirit on his followers:” in p. 66, of slaking the parching thirst of jealousy at another’s welfare, and burning in the devouring flame of dark revenge! in p. 72, of bigotry and idolatry enveloping us with the crimson mantle of intolerance; and p. 170, of enjoyment being tarnished by agonizing fear, and of alarm spreading a dark contagion through every vital principle; *cum multis aliis!*

How such pompous nothings are sometimes strung together, the reader may see in the following passage, which affords a fine specimen of the *mixed metaphor*.

“The spirit of activity implanted in the soul—the desire to expand our wings, and to stretch beyond ourselves, combine to urge the mind to explore other regions, to converse with other men, to unite with other hearts, to visit the wider circles of the creation:—we first ponder upon the brink, but too soon steer upon the broad and fathomless wave:—we meet with various subjects that court our desire, and pleasure woos us to her bower before we have allowed ourselves time to examine her real features or her garb; too late we find them deceitful above measure—changing in every position as the varying hues of evening—neither solid nor permanent;—she cannot disguise that she courts sensation only—and thereby proves to our conviction, that memory and reason were given us in vain, if pleasure be the sovereign good!”

We could quote many similar passages, but in pity to our readers, our author, and ourselves, we forbear; lamenting that so excellent an intention should be defeated by a want of judgment and ability.

We cannot conclude without noticing two errors of a very gross and singular nature. In the 8th sermon, Herod who imprisoned Peter is considered as the same that murdered the infants of Bethlehem! and in sermon 9th, Pilate is spoken of as a Jew!

ART. XXXV. *Sermons, designed, chiefly, as a Preservative from Infidelity, and Religious Indifference.* By JOHN PRIOR ESTLIN. 8vo. pp. 367.

THE notice of these sermons was unfortunately omitted in our last Review; but so great is their value, that we are anxious to supply the defect by giving them a place in our present volume; and

by recommending them to the attention of those who have not already availed themselves of the important instruction they convey. Few volumes of this nature, which have necessarily claimed

our regard, have, in our opinion, displayed a sounder understanding, or a more vigorous and independent mind. The preacher's heart appears to be alive to every kind and benevolent affection, and to be warmed with a zeal worthy of a christian minister, firmly to establish the foundations of the Christian faith, and to raise the beautiful superstructure of a holy and a virtuous life.

The volume consists of twenty-one sermons on the following subjects: On faith; on fortitude; on justice, mercy, and walking humbly with God; the character of Nathaniel; miracles; the neglect of advantages sinful; God no respecter of persons; David's advice to Solomon; the example of Christ in his youth; the improvement of the death of ministers, a funeral sermon for the author's colleague, the late reverend T. Wright; the intermediate and future state; the future happiness of the righteous; misery the lot of the wicked; the wicked excluded from heaven; all things for God and by him; on education in general, with remarks on female education; the danger of imitating fashionable vices; the salutations of Paul; and the love of our country explained and illustrated.

These subjects are all of acknowledged importance, and they are all treated in a masterly and impressive manner. We extract the following passages, not as being more excellent than others; but because the one is particularly deserving of attention in the present times, and the other contains some information which to many will be new.

In the discourse on fortitude, Mr. Estlin observes:

"The gothic practice of duelling (certainly deserving of this epithet, as it was introduced into the more civilized nations of Europe by these barbarians, and is a remnant of their barbarity, and a proof that we are not so far advanced in national refinement as many apprehend) is by some considered as a test of personal fortitude. Little needs be said to demonstrate that it is totally incompatible with that fortitude which is founded in the fear of God, and which consists in a freedom from every other fear. If we analyze the principles from which it proceeds, we shall find that in their composition the main ingredient is not courage of any kind, but fear, under some or other of its modifications. Fear, as was before observed, having for its object some evil, either real or apprehended, those things which we consider as evils are feared by us in the degree in

which they appear to be evil, and those which are considered as the greatest evils are consequently most dreaded. From this opinion of evil, which directs the application of fear, a person's character is drawn, and his conduct determined. If, for instance, poverty be considered as the supreme evil, riches will be considered as the supreme good; if insignificance be thus regarded, fame and power will be the great objects of pursuit; and if the censure of men be thought most to be dreaded, their approbation will be esteemed as the most valuable of all acquisitions. Now in the case of receiving a challenge (for giving one does not come under this description, but is a crime of a still deeper die) I say in the case of receiving a challenge, which is sometimes vindicated, on the ground of its being a test of fortitude, it cannot be denied that a fear of incurring the censure of men, is the principle which gets the better, not only of a regard to justice, a respect for the laws of all civilized communities, and a fear of offending God, but what is in some minds (and I doubt not in the minds of those very persons who fall into the practice) a stronger principle than any of them, a love of life. To this modification of fear, and to this principle alone, a conduct is ultimately to be resolved, which is a satire upon civilization and refinement, which strikes directly at the root of all laws both human and divine, which annihilates every moral distinction, which makes death indiscriminately the punishment of all crimes, the lowest as well as the highest, which is as absurd as if the person who had been robbed and plundered were to be convicted equally with the person who had robbed and plundered him, and which in its immediate effects has frequently involved innocent families in the keenest distress, and sent those on whom they depended for support, with all their sins unrepented of, and with the guilt of intentional murder upon their heads, to their final account. To such astonishing lengths will persons sometimes go through a depravity of principle, and a perversion of understanding, occasioned by the influence of fashion. But what is most extraordinary, this shall, after all, be termed fortitude. Let us, my brethren, be no longer imposed upon by names. To give a challenge is to intend murder: to receive one, besides the other evil qualities included in it, is cowardice, it is that contemptible "fear of man which bringeth a snare," which is often greater than the fear of death, or even the fear of incurring the displeasure of Almighty God."

The sermon on miracles exhibits the following curious information:

"We come now to shew, that the accounts which are given of these surprising transactions, are such, as from the circumstances attending them must be true. But previously to our entering upon this part of

the subject, it may not be amiss to take notice of an objection which has been made, with great exultation, against miracles in general. It has been suggested to me by a friend,\* that this objection might be found in a sermon of Dr. South's. I have since met with it in the fifth volume of his sermons, and for a reason which will hereafter be given, I shall lay it before you in his words. In a discourse on our Saviour's resurrection, he supposes Thomas to make this objection to the fact. 'Jesus of Nazareth was put to death upon the cross, and being dead, was laid and sealed up in his sepulchre, strictly watched by a guard of soldiers. But I am told, and required to believe, that, notwithstanding all this, he is risen, and is indeed alive. Now surely things suitable to the stated course of nature should be believed, before such as are quite beside it; and for a dead man to return to life, is preternatural; but that those who report this may be mistaken, is very natural and usual. Neither can bare report of itself be a sufficient reason of belief; because, things confessedly false have been as confidently reported; nor is any thing, though never so strange and odd, ever almost told of, but somebody or other is as positively vouched to have seen it. Besides that, the united testimony of all ages and places will not gain credence against one particular experiment of sense; and what then can the particular report of a few conclude against the general experience of so many people and nations who had never seen any thing like it?' He afterwards repeats the objection in these words,—'Things, according to the common stated course of nature, ought to be believed before such as are beside it; and that it is beside, as well as above the course of nature, for a dead man to return to life; but, on the contrary, that those who report such strange things may be deceived in what they report is very natural and usual. It is argued, that as the united testimony and report of all places and ages will not gain credence against so much as one particular experiment

of sense; so much less can the particular report of a few persons conclude any thing against the universal experience of all men.'

"Mr. Hume says, 'I flatter myself that I have discovered an argument, which, if just, will, with the wise and learned, be an everlasting check to all kinds of superstitious delusion, and, consequently, will be useful as long as the world endures.' He then gives this very argument against miracles. 'The very same principle of experience,' he says, 'which gives us a certain degree of assurance in the testimony of witnesses, gives us, in the case of miracles, another degree of assurance against the fact which they endeavour to establish. A miracle,' he says, 'is a violation of the laws of nature; and, as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as entire as any argument from experience can possibly be imagined.' This coincidence is a very curious circumstance. I have given you the very words of both writers, and would, by the way, make one observation before I proceed. Notwithstanding the pretences to originality in the writers against Christianity (in which I mean not to arraign their sincerity, but their knowledge of the subject) it is easy to demonstrate that not a single argument has been urged by modern writers, without excepting Paine, who doubtless thought that he had made the world much wiser than it was before, which has not been urged, with at least as much effect, by ancient writers; so that the question is not whether Mr. Hume and Mr. Paine, and such writers, have now overturned Christianity; but whether Julian, Porphyry, Celsus, and others, and even Christians themselves, by their own objections had done it before, or whether they are not completely answered."

Several of these discourses are addressed to young persons, from which we could with pleasure select many useful and impressive remarks.

ART. XXXVI. *The Advantages of diffused Knowledge, a Sermon preached at Scarborough, August 8th, and at Kingston upon Hull, December 5, 1802, for the Benefit of two Charity-Schools, instituted at those respective Places for the Education of the Children of the Poor.* By FRANCIS WRANGHAM, M. A. 4to. pp. 20.

WITH much pure and forcible eloquence Mr. Wrangham here successfully vindicates the attempt to diffuse knowledge, and especially religious knowledge, among the poor, against "the bigot and the infidel, who from different motives contend, that knowledge imparted to the inferior orders is always superfluous, often pernicious,

and sometimes ruinous in its effects upon their innocence and peace." After shewing the importance of communicating instruction to those who constitute "the productive portion of our fellow-subjects, and the wide-spread basis of the British pyramid," the preacher urges the duty of strenuous exertions on the part of the more affluent orders. The

\* Mr. Coleridge.

whole is concluded by an animated recommendation of those children for whose sake the sermon was delivered, as probably destined for the most part to a naval life, and so precluded from scenes generally more favourable to the

future acquisition of religious knowledge. We could with pleasure select this passage, were we not forbidden by the limits within which we must contain ourselves.

ART. XXXVII. *A Sermon, preached at the Chapel in St. Saviour-Gate, York, on Sunday December 26, 1802, on Occasion of the much-lamented Death of Robert Cappe, M. D. with an Appendix, containing brief Memoirs of his Life.* By CHARLES WELLBELOVED. 8vo. pp. 51.

A Tribute of affection to the memory of an excellent and valuable friend. The eminence to which the lamented subject of this pathetic discourse and interesting memoir had attained, in an important profession, at so early a period of life, is highly honourable to his memory, and creditable to the discernment of his fellow-citizens. The

removal of such a character from the scene of extensive usefulness, is an event which cannot be fully comprehended, and to which they who survive cannot possibly be reconciled, but by those Christian principles which the preacher has largely illustrated, and zealously enforced.

ART. XXXVIII. *The Duties of loving the Brotherhood, fearing God, and honouring the King, illustrated and enforced in a Sermon, preached before Two Friendly Societies, by the Rev. FRANCIS SKURRAY, M. A. Curate of Horningsham, Wilts.* 8vo. pp. 32.

THIS discourse, boasting of nothing eloquent and energetic, derives its value from the liberal views, the loyal sentiments, and the truly pious zeal of the preacher. "It owes its publication," we are informed, "not to the suggestions of friendship, nor to any motives of literary vanity. It was sent by its

author to the press, in order to imprint more indelibly on the minds of his parishioners than verbal recitation possibly could do, sentiments of unanimity and loyalty, at this critical and eventful period."—May these desires of the preacher be accomplished!

ART. XXXIX. *A Sermon on the Depravity of the human Heart, exemplified generally in the Conduct of the Jews, and particularly in that of Lieut. Col. Despard, previous to his Execution; preached at St. George's, Hanover-Square, Feb. 27, 1803, by the Rev. W. LEIGH, LL. B. Morning Preacher at the aforesaid Church, and Rector of Little Plumstead, Norfolk.* 8vo. pp. 22.

WE will not consume our own time or that of our readers, in inveighing against the too frequent practice of publishing single sermons, which have nothing either in the matter or the style, no principle enforced by masterly reasoning or illustrated by chaste and vigorous eloquence, so recommend and entitle them to public notice; although we might appear to be more than justi-

fied by the discourse now before us.—Delivered with all the grace of clerical action, the impression it made must have been very feeble; and now presented to the eye, it does no more than prove that the preacher felt what thousands felt at the same time, with at least equal vigour, but which few would not have expressed with far more energy and effect.

ART. XL. *A Review of Christian Doctrine, a Sermon preached at St. Thomas's, Southwark, Dec. 26, 1802, and at the Gravel-Pit, Hackney, January 2d, 1803, on resigning the Office of a Minister in those Societies.* By JOHN KENTISH. 8vo. pp. 29.

ART. XLI. *A Letter to the Rev. John Kentish, occasioned by some remarkable Passages in his Sermon, entitled a Review of Christian Doctrine, delivered at Hackney, on Sunday, January 2, 1803.* By WILLIAM STURCH. "*Semper ego auditor tantum?*" 8vo.. pp. 33.

THE first of these articles is, as the title imports, a discourse delivered by the author to two societies of christians, upon relinquishing the charge he had held as one of their ministers. The preacher, we believe, is generally known, and by his more intimate friends highly respected, as a liberal and zealous unitarian. Addressing for the last time, in the character of their minister, the people with whom he had long officiated, he thought it not improper to review upon that occasion, the doctrine which they had heard from him in his public services. He, therefore, in a brief but very able manner, recapitulated the leading subjects of his discourses: God—Divine Worship—Revelation—Jesus Christ—the Scriptures—Christian Ordinances—and the Situation, Duties, and Expectations of Mankind. Concerning each of these he candidly states what has been the nature and burden of his instructions, and concludes his discourse with some practical reflections adapted to the particular situation of his hearers.

In the course of his address, the preacher observed, that Jesus was not only the subject of prophecy, but him-

self a prophet, having distinctly foretold the destruction of Jerusalem by the Roman armies: that the hope of a future resurrection must be built solely on the death and resurrection of Jesus Christ; that naturally man is mortal, but Christianity renders him immortal; that the Scriptures represent death as a state of profound sleep; and, that the neglect of social worship is disgraceful.

These assertions, Mr. Sturch, the supposed author of a Free-thinking Tract, entitled *Apeleutheros*, and occasionally, at least, a hearer at the Gravel-pit, considers as unfounded. With respect to some of them we are inclined to think with him; but others, and especially the first, rest upon a foundation which no efforts of Mr. Sturch can shake. But we leave the proof of this with the preacher; who, if he judges it worth while to republish arguments which never have been, which we are fully persuaded never can be refuted, will easily subvert all that Mr. Sturch has advanced to destroy the character of Jesus as a prophet, and to disprove the publication of the gospels previous to the destruction of Jerusalem.

ART. XLII. *The Nature and Duties of the Christian Ministry; and the Co-operation of a Christian Society with the Labours of its Ministers: two Sermons preached at the New Meeting, in Birmingham, January 23, 1803, on undertaking the Office of a religious Instructor in that Congregation.* By JOHN KENTISH. 8vo. pp. 40.

THESE two discourses may be read with advantage, both by Christian ministers and their hearers. They are plain, serious, and impressive, and contain many observations of great importance to persons of these respective characters.

We subjoin the following extract as worthy of the attention of those who occupy stations in society similar to that of the author:

"It has sometimes been asked, whether the Christian minister ought to lay before the audience whom he statedly addresses, the full result of his opinions respecting the doctrines of the gospel? With us, my brethren, I trust that there can be no such question. Among the numerous causes

which have hindered the progress of divine truth, none, probably, has been more hurtful than the resolution formed by some instructors to conceal or disguise their religious sentiments from their respective congregations: so that during, perhaps, a long connexion, the society has remained totally ignorant of its teacher's faith upon subjects of the first importance; and the teacher has boasted of his keeping them in this ignorance.—For myself, whether I reflect upon the very end and nature of our office, upon the uniform practice of Christ and his apostles, upon the enormous corruptions under which it has been almost buried, or upon the circumstances and wants of man, I cannot doubt but that it is our duty to declare unto you the whole counsel of God;—to declare it with meekness, indeed, yet with honesty and firmness;

calling upon you, as wise men, to judge of what we say. I am no friend to the unreasonable intrusion of even useful and momentous truths: I am no advocate for dogmatism and presumption. But I am equally hostile to that temporizing spirit which, under the specious names of prudence, catholicism, and moderation, would leave the world in ignorance concerning the object of worship, the rank of Christ, the terms of salvation, and the final destiny of man. Detestable be the attempt to seek or preserve a short-lived popularity, to gain the suffrages of ignorance or the applauses of prejudice, by the use of words which are thought to express, but which in reality do not express, nay which are known by us not to express our views of evangetic doctrine! These arti-

fices are utterly inconsistent with christian simplicity and godly sincerity; and, verily, they who practise them have their reward—a base ignoble reward, far unlike the solid recompense which awaits the men who are the fearless patrons of dishonored truth. It is in vain to allege that all Christians agree in the belief of points essential to salvation, and that there are wise and virtuous men of every persuasion. This, I grant, is a forcible plea for candid behaviour towards those whose creed differs from our own; but it cannot be admitted as valid in defence of that indolence which refuses to inquire, of that timidity which fears to state the issue of its inquiry, or of that disingenuousness which handles deceitfully the word of God."

ART. XLIII. *The Duty of Britons, at the present awful Crisis of their Country, a Sermon preached August 7, 1803. By JOHN OVERTON, A. M. Rector of St. Margaret and St. Crux, York.* 8vo. pp. 32.

FROM 1 Chron. xix. 13. the preacher recommends to his countrymen, in the midst of the dangers by which they are threatened, "humble confidence, vigorous exertion, and pious resignation." In order that they "may cherish a humble confidence that all will yet be ultimately well with them, he exhorts them to reflect on the goodness of our cause, on the goodness of our God; on the degree of true religion yet remaining in the nation; and, on what God has already done for us, and by our means." Of the exertions which are requisite he says, "We must be valiant against sin, valiant in prayer; cheerfully contribute our pecuniary and personal aid; and, in general, must each

of us, according to our various talents and opportunities, do our utmost for the public advantage. The wicked must reform, the righteous must intercede, the rich must contribute, the wise must deliberate, and the strong must fight. Our purses, our persons, our hearts, heads and hands, all our faculties, and all our energies, must be exerted in the cause."

Although this discourse claims not the praise which is due to eloquence, it breathes a loyal, a patriotic, and a pious spirit, and is well adapted to serve the important purpose for which it was originally preached, and is now given to the public.

ART. XLIV. *The National Defence, a Sermon, preached in the Parish Churches of Wainfleet, All Saints, and Thorpe, in the County of Lincoln, on Sunday, August 7, 1803. By the Rev. PETER BULMER, A. B. Vicar of Thorpe, &c.* 8vo. pp. 16.

"THE object of this discourse," we are told, "was to impress the minds of the hearers, especially those of the lower class, with a just sense of the present critical state of the country; and by pointing out the wisdom and necessity of the measures which have been sanctioned by the legislature, for the general defence and security of the realm, to animate them to prompt and vigorous exertions in assisting to carry such measures into execution." This object is highly laudable, and the means adopted to secure it are deserving of much commendation. The text which the preacher has selected, is Nehemiah iv. 14. "Be not afraid of them; remember the Lord who is great and terrible, and fight

for your brethren, your sons and your daughters, your wives and your houses." Animated by a truly British spirit, zealous for the honour of his country, and the interests of mankind, he describes in strong and glowing language, the atrocious character of our insolent foe; he points out the duties which are incumbent on his countrymen; he directs them whence to gain strength in their present difficulties, and animates them to meet and to repel the dangers with which they are menaced. We are not surprised that "its effect, at the time of its delivery, was such as to induce a wish that its usefulness might be farther extended by means of the press."

ART. XLV. *Britons exhorted to the Defence of their Country, in an Address on the threatened Invasion by France, delivered Aug. 28, 1803, at Trim-Street Chapel, Bath, by the Rev. THOMAS BROADHURST.* 8vo. pp. 24.

“IT is a good land,” saith the preacher, from Deut. i. 25, “which the Lord our God doth give us.” Warmed by the contemplation of its excellencies, indignant at the threats of an usurping enemy to rob us of our envied enjoyments, he endeavours to excite in the breasts of others similar feelings, and, we apprehend, not without success. We cannot forbear from making one short extract from this animated address :

“Blest with the enjoyment of personal liberty, and the security of property, and free from all oppression of rank and greatness, the inhabitants of Britain are deeply interested in the preservation of much actual and positive good. But even if our situation were less favourable to happiness than it is, even if our lives and our property were rendered less secure by the misconduct of our governors, and by acts of extortion and of cruelty, we cannot suppose that our condition would be at all ameliorated by a change of masters, and especially of such masters as we should find those to be, who are anxiously endeavouring to make us their prey. No, my countrymen, our situation would be a thousand times worse. We should be scornfully trampled to the dust. We should be ground to pieces by oppression. Our implacable enemies would satiate their utmost vengeance upon us in every possible way that malignity and ingenuity could devise. We should become hewers of wood,

and drawers of water. We should be chained to the oar, or consigned to the dungeon. Foreign troops would take up their abode with us in our dwellings ; and we should be daily insulted by the sight of those who had deprived us of every thing but life, and who would be ready to deprive us of that upon the slightest suspicion or provocation. The produce of our industry we should not be at liberty to enjoy. We should, indeed, plough and sow our fields, but our proud conquerors would reap the harvest. The flower of our youth would be pressed into the service of their tyrannic masters, and be sent from their homes to engage in supporting a system of universal oppression, and in making fresh additions to lawless power. O fatal day ! when such is the lot of Englishmen ! That day will be a day of weeping and lamentation. That day will be wrapt in clouds and darkness. Whoever wishes for the arrival of that awful day, wishes for the advent of all that is calamitous and dreadful. He is the enemy of his country. He is the enemy of the human race. He is a base degenerate son of Britain, fit only to be a slave ; fit only to associate with those, who have lost all dignity of sentiment and elevation of mind. He possesses neither the spirit of a man, nor the philanthropy of a Christian. There is not such a man among us. If there be, he was not born in this happy isle. He was never nurtured in a land of freedom. From his natal day he has breathed only the polluted air of slavery.”

ART. XLVI. *Courage and Union in a Time of National Danger, a Sermon, preached Oct. 9, 1803, at the Unitarian Chapel, Essex-street, by the Rev. JEREMIAH JOYCE.* Second edition, 8vo.

FROM the example of Nehemiah, recorded Nehemiah vi. 11, Mr. Joyce recommends the most strenuous and fearless opposition to that ambitious power which threatens to invade us ; and exhorts his countrymen to determine to risque their lives to defend their independence. This sermon is another of those animated patriotic addresses which

the peculiar circumstances of the times have called forth ; and will, no doubt, greatly contribute to “rouse his countrymen to the exercise of those rights which may be the means of securing to themselves and their descendants the same honourable rank in the world they have so long held.”

#### FAST SERMONS.

ART. XLVII. *Britain's Defence. A Sermon preached Aug. 21, 1803, in the Protestant Dissenting Meeting House, Battersea.* By JOSEPH HUGHES, A. M. 8vo. pp. 43.

OF this sermon many passages are eloquent and beautiful ; and many others claim a much higher praise, that of being animated by a spirit truly benevolent

and evangelical. We are informed that the subject of this discourse was chosen with an immediate reference to a circular meeting for prayer and exhortation, re-

cently established in the author's neighbourhood. This subject is connected by the preacher with the present alarming situation of public affairs; and his object is to shew that a devotional spirit is of the greatest importance to the welfare of communities in general, and in particular to the welfare of our own country at this critical season.

After a delineation of the horrors of war, Mr. Hughes concludes, notwith-

standing, that defensive war is, on the principles of christianity, justifiable; and that as such the present contest may be regarded, at least in reference to the project of invasion.

The excellence of the leading sentiments of this discourse is such, that we shall not dwell on some subordinate blemishes, which might, perhaps, be pointed out.

ART. XLVIII. *A Sermon preached on Wednesday, October 19, 1803, the Day of National Humiliation, to a Congregation of Protestant Dissenters in St. Saviourgate, York.* By CHARLES WELLBELOVED. 8vo. pp. 37.

MR. WELLBELOVED pleads the haste with which this discourse was composed, and the short and unfrequent intervals of stated engagement which were allowed for its revision, in extenuation of the imperfections which he supposes will be discovered in it; and which, he says, under any other circumstances than those which attend its publication, would have prevented it from meeting the public eye. We may, however, venture to state our opinion, that his discourse will maintain a respectable rank among the many publications to which, from motives similar to his own, the services of the day appointed for national humiliation have naturally given birth.

Mr. Wellbeloved has chosen the apposite history of the invasion of Judah by Sennacherib, as the passage of scripture with which his reflections are connected. After a relation of that event, extracted from the accounts afforded by the sacred historians, he remarks the similarity which it bears to the present situation of our own country, and the menaced enterprize of our enemies. We extract the following passage, which contains the political creed of the author respecting the nature and object of the important contest in which we are engaged.

"Although I confess myself to be one of those who think that it would have been more advisable to have abided by the very letter of our treaties, and not to have afforded the enemy either the slightest pretence for the renewal of hostilities, or the possibility of justifying their conduct to the powers of Europe; yet I cannot close my eyes against the evidence which has been produced, to prove that the present ambitious ruler of France, who exists only amidst the noise and tumult of war, was, during the short season of peace, before the cession of a rocky island were demanded and refused, unceas-

ingly and extensively employed, in what may be justly considered, not merely as the preparations for a future contest, but as violations of the peaceful character which he was bound to maintain. His military missions to the East, under the specious pretext of extending the commerce of France; the powers with which his pretended commercial agents in our own country were invested; the encouragement he gave to the disaffected in our sister kingdom, and the assurance which they appear to have received of his support in their attempts to overthrow her government, are to my mind, most powerful and convincing proofs of a hostile spirit utterly inconsistent with his open professions of amity, and demonstrate that he was ready and determined to seize any pretence to renew the war which had been so lately terminated. The contest on the part of our foe, I am fully persuaded is not now carried on, nor was it at first undertaken to secure the possession of a barren rock in the midst of the Mediterranean sea, but to humble the only power that remained prompt to watch, determined and able to arrest the rapid strides of lawless ambition; and to reduce to the same abject state in which the once most free and generous people of Europe are now lying, a nation, which, by its example and its influence, presents a constant and a formidable obstacle to the progress of tyranny and oppression. The nature of the war then affords us some ground for hope; it is a defensive war. Even to those who cannot fully approve of its origin, it must now appear a contest of no ordinary nature, and affording no ordinary reason to hope for the Divine protection. So far as the menaces of our enemy are to be believed, our extirpation is the object which animates all his efforts: his rage is boundless as his ambition, insatiable as the grave. Upon the issue of the present war, depends not the possession of a few islands on a distant ocean, or of rich provinces, in a distant continent; but our existence, as that free people who have been long the admiration of the world. However trivial the pretext for entering upon the war may have been, the cause for which it is

carried on, is weighty and momentous, no less than the preservation of our liberties and our lives. We are fighting now for the shade of our own oaks, and the streams from our own springs. We are called now to defend our rightful monarch from degradation and insult; our princes, our nobles, and our senators from poverty and exile; our wives and daughters from the brutal violence of a lawless soldiery; our fathers and our sons from slavery and from death. When we think over the magnitude and extent of the misery with which we are threatened; instead of despondency, why feel we not confidence? To animated exertions it cannot fail to rouse every British arm; and that these exertions will prevail, it affords to every British heart no unstable ground of hope. The proud Assyrian led in vain his locust troops to pollute and to destroy the little hill of Zion: the Persian despot having marched in eastern pomp, at the head of the whole force of his extensive empire, to insult and to overthrow the venerable seat of ancient Liberty, returned a miserable fugitive, unpitied and alone, through those very provinces, which were lately not sufficient to supply the luxuries of his table. We ourselves, in later times, were discomfited, when we unjustly attempted to prevent the independence of our powerful and distant colonies, and to fill our treasury on the banks of the Thames,

with the profits of the industrious settler on the shores of the Ohio: and even they who are now threatening to be the invaders, were not suffered to fall before the numerous and well-disciplined forces that were not long since on their march to dictate to them the government they should form, and the laws they should obey. Why then may we not humbly trust in the same benevolent Providence to baffle and to bring to nought those counsels and those attempts, which would deprive us of our dearest privileges; violate our most sacred rights; rob us of our most valued possessions; and reduce us to slavery, misery, and ruin?"

The sequel of this discourse is employed in an estimate of our national character, and the aspect which it bears on our present situation; in an animated description of the consequences which would result from the success of the hostile enterprize; and an earnest recommendation, as the importance of the cause demands, to the use of those efforts, in dependance on divine Providence, which may most speedily accomplish a favourable termination of the contest in which interests of such magnitude are involved.

**ART. XLIX.** *A Sermon preached at Peterborough, on Wednesday, October 19, 1803, the Day appointed for a General Fast. By the Rev. SPENCER MADAN, A. M. Prebendary of that Cathedral.* 8vo. pp. 22.

FROM a striking and appropriate passage of scripture, (Hab. iii. 2.) Mr. Madan directs the attention of his audience to some just and pertinent reflections on the state of public affairs. From the first clause of his text, "O Lord, I have heard thy speech and was afraid," he properly represents the present threatening aspect of events, as an awful intimation to mankind of the necessity of reformation, and the practice of public and private virtue. He does not encourage us to hope for victory and safety, because we may conceive our adversaries to be more wicked than ourselves; we have each of us crimes of sufficient magnitude to account for; and it is our wisdom to estimate, with most scrupulous examination, the sum of our own guilt. But while, in hearing the voice of God, we have reason to fear, we have also reason to hope that "in

wrath he will remember mercy." From this part of his text, Mr. Madan takes occasion to review some of the most remarkable instances of national deliverance, which occur in the latter ages of our history; to advert to our human means of protection, and to encourage the hope that, if repentant, we shall, in the day of danger, experience the divine blessing and assistance.

The composition of Mr. Madan's sermon is, in general, careful and somewhat studied. In a few instances, his language partakes rather too much of a poetical structure. For instance: "The victories, the fierceness, the rapidity of the foe, became conscious of a sudden reverse." The following words (p. 23,) present a complete verse of ten syllables: "Or taint with pestilence the breath of heaven."

**ART. L.** *Unanimity and Energy in the present Crisis. A Discourse delivered in the Dissenting Chapel at Lympston, Devon, on Wednesday, Oct. 19, 1803, being the Day appointed for a General Fast. By the Rev. THOMAS JERVIS. 8vo. pp. 61.*

THE author of this eloquent discourse takes an ample range of political, moral, and religious reflection, adapted to our present situation. The text is taken from Isaiah ii. 4. After some illustration of the prophetic style of this passage and its context, the author proceeds to describe the awful nature of the contest in which we are engaged, after the transient period of tranquillity succeeding the fierce and bloody war, by which this nation was lately occupied. Her situation is now different from that of the late and almost every former contest in which Britain has been involved. We have now to sustain alone the attacks of a mighty foe, before whom Europe has fallen; danger is at our gates, and our independent national existence is the stake in question. At such a crisis every other sentiment and consideration must be suspended; the country is in danger; its citizens hear no voice but that which calls them to arm in its defence. In this part of his discourse, Mr. Jervis draws an animated, and, we believe, a just picture of that extraordinary man, as he is justly termed, who threatens to assail us. To undervalue the talents and formidable qualities of our adversary, is folly; to appreciate them justly, and prepare ourselves with the requisite vigour to counteract their effects, is true magnanimity and prudence. We should with pleasure extract the whole of this well-drawn character, did it not extend to a length exceeding the proper limits of this article: we must therefore confine ourselves to the following sketch of the consular period of his life.

“The instant he appeared in the capital of France, he placed himself at the head of one of the most populous, extensive, rich, and fertile nations in Europe. There he still governs with an absolute sway, and rules without control. All is obsequious to his nod. His will is absolute, his word is law. His colossal power is identified with the very existence of the great country over which he presides. Giddy on the lofty pinnacle of power, intoxicated with the unexampled splendor of his accumulated fortunes, and the grandeur of his elevation amongst the potentates of the world, he now gives an unbridled loose to the suggestions of a wild, visionary, and domineering ambition! Whether it is that unlimited and absolute power tends to develope the real characters of men;

or, that unmerited prosperity instils a subtle poison into the human heart, and corrupts and contaminates the most exalted minds—be this as it may, the subsequent conduct of this hitherto wonderful man, places him before our eyes under a new and different aspect. He is now lofty and imperious, inflexible and severe, crafty, dark and suspicious, cruel, impetuous and revengeful. Nothing can withstand the irritation and fury of his passions. Yet, in the wildest paroxysm of passion, though alike regardless of the considerations of personal dignity and the forms of external decorum, never does he so far lose the possession of himself as to defeat the purposes of deep dissimulation, of a subtle and designing policy. In these representations, I would not wish to subject myself to the imputation of indulging in the language of harsh and indiscriminate censure, of unfounded calumny, or of a disingenuous intention to blacken that conduct which is in itself sufficiently atrocious. But, let us for a moment advert to that dereliction of principle, that accumulation of hypocrisy and crime in which his political character is enveloped; his oppression at home, and his exactions abroad; and I fear we shall be amply justified in stating that he has made humanity the pretext of his ambition, and religion a mere engine of political intrigue; and thus has betrayed the cause of liberty, that venerable cause which he professed to foster and cherish, to patronize and protect; but which in reality only served him as a ladder by which to climb to empire and fame! Let us call to mind only a few of those events which have marked his progress. And here, let me ask, is not this the man whose insatiable lust of conquest has ravaged Italy and Germany—has invaded the territories, and annoyed the peaceful inhabitants of Holland and Belgium, and grasped with a rapacious hand the fruits of their honest industry and labour? Is not this the man, who, with a remorseless insensibility, disturbed the tranquillity of the simple, unoffending, brave and generous Swiss, in the hallowed recesses of their mountains and vallies; and with a cruel and insidious pretence of redressing their supposed wrongs, laid them under the iron yoke of a despotism more burthensome and galling “than they, or their fathers,” and their venerable ancestors “were able to bear?” Is not this the man, who has violated the laws of justice, and resisted the claims of humanity and freedom in the distant regions of the Atlantic—who attacked the natives of St. Domingo, defending themselves in the natural entrenchments and the impregnable fortresses of their woods and mountains; gallantly fighting for

their wives and children; and bravely opposing the attempts of the hostile invader to subjugate and enslave them: till, at length, foiled in his enterprize, after immolating thousands of unhappy victims upon the altar of a dishonourable ambition, he was reduced to the necessity of withdrawing the reliques of his army which were saved from the ravages of the climate, and the fury of the injured inhabitants?"

The remainder of this very animated discourse is devoted to a just estimate of the nature of our danger, and the degree of confidence which we are entitled to entertain, and the moral and religious reflections with which it becomes us to occupy our minds. The wisdom of a liberal policy, on the part of government, for conciliating and uniting all classes of the nation, is pertinently recommended and enforced.

ART. LI. *Courage, Patriotism, and Resignation, the Duties of the present Times. The Substance of a Sermon preached at Churchgate Chapel, Stockport, Oct. 19, 1803. By W. EVANS.. 8vo. pp. 23.*

THIS is a discourse marked by the same patriotic sentiments and principles, which we have already noticed in so many similar publications. From

We have sometimes thought that there exists a considerable similarity between the characters of Hannibal and the French consul. We do not however accept the omen of the comparison, that, like another Hannibal, he shall bring destruction to the entrance of our capital: we believe, that to cross the channel, commanded, as it is, by British fleets, is an enterprize more difficult than to surmount the Alps; but should our adversary break through this barrier also, we trust that he will still find, on British ground, some British Scipio, who shall terminate his career of triumph, and place a final obstacle before his way to that universal empire at which he seems to aim.

ii Sam. x. 12, the preacher exhorts us to defend our country with courage, to prize its worth, and to resign ourselves to the will of God.

ART. LII. *Reformation of Life, Trust in God, and vigorous Exertions recommended. A Sermon preached in the Chapel of Berwick, Oct. 19, 1803. Being the Day appointed by Proclamation for a Public Fast. By SAMUEL BUTLER, M. A. 8vo. pp. 22.*

MR. BUTLER is advantageously known to the public, as having distinguished himself at Cambridge by his acquisitions in classical literature; and in his present situation he has, we believe, rescued a considerable and once flourishing seminary of education, from a state of great decline to fresh activity and usefulness. The present discourse bears many marks of a cultivated and liberal mind. The text is from Deuteronomy xx. 1. The plan of the sermon is delineated in the title-page.

Mr. Butler mentions with just abhorrence and indignation, the infernal de-

creed of the convention to allow no quarter to the English and Hanoverians, and animadvert with becoming spirit on the very unjustifiable intimations which have appeared in some of our own journals, for the adoption of a similar conduct against the force which may invade our country. Mr. Butler, in censuring the French rulers, ought in candour and justice to have mentioned, that the soldiers refused to obey the orders of their government: nor was the decree, we believe, ever in a single instance executed.

ART. LIII. *An Antidote to the Alarms of Invasion: a Discourse delivered at the Meeting House in the Old Jewry, on Wednesday, Oct. 19, 1803, being the Day appointed for a General Fast. By ABRAHAM REES, D. D. F. R. S. Editor of the New Cyclopædia. 8vo. pp. 23.*

"ACCUSTOMED" to reason more than to declaim," Dr. Rees takes occasion, from Nehemiah iv. 14. to state some obvious arguments, that seem to justify the application of the words of the text to our own case. To shew that Britons ought not to be afraid of their enemies, but to fight with confidence,

he exhorts us to consider: 1. The nature of the contest in which we are engaged. 2. The character and views of the enemy with whom we have to contend. 3. The important and invaluable objects which depend upon the present contest. 4. The advantages which are likely to result from the prosperous issue of it. 5. The

means of our defence; and 6. That in the cause of justice and self-defence, we may rely on the providence of Almighty God. If we meet not with any towering flights of eloquence, we have what

the preacher considers as of higher value, good sense, sound argument, and the expression of firm and rational piety, pure patriotism, and unshaken loyalty.

ART. LIV. *Trust and Confidence in the universal and sovereign Government, and constant Providence of God: a Sermon preached in the Unitarian Chapel in Essex-street, London, on Wednesday, October 19, &c.* By JOHN DISNEY, D. D. F. S. A. pp. 22.

“DISAPPROVING of the discussion of merely political topics, in a place appropriated to religious instruction,” and wisely judging that “our fortitude in promoting and securing our defence, or in bearing and suffering our defeat, must be built on a broader and more satisfactory foundation, than that of merely gratifying our indignation at the avowed jealousies, asperities, or resentments of an ambitious and sanguinary enemy,”

Dr. Disney “proposes simply to suggest to his hearers such observations and reflections, deduced from the superintending providence of God, as have been and continue to be the support of his own mind.” The words of the text are selected from Rev. xix. 6. Though not destitute of animation, this discourse is chiefly distinguished by its piety, and the liberal and enlarged views it presents of the government of God.

ART. LV. *The Situation, the Prospects, and the Duties of Britons in the present Crisis of Alarm and Danger, represented in a Discourse delivered to the Unitarian Congregation at Hackney, October 19, &c.* By THOMAS BELSHAM.

THIS discourse is of a complexion somewhat different from the preceding. The preacher does not avoid politics, but he introduces them no further than as they were naturally suggested by the subject and occasion of his address.—The situation of the country, he considers as alarming, from the peculiar character of the present contest, to which there appears no prospect of a termination; but still he sees no reason for despondency. The power of the British navy, the bravery of our defenders at home, the unexampled unanimity of the nation, the conciliatory spirit of the present administration, the moral character of Britain, the recollection of the seasonable interposition of Divine Providence in past emergencies, unite to afford a good ground of hope, that the divine blessing will accompany our strenuous exertions. With respect to the du-

ties incumbent upon us at the present crisis, the preacher observes, that we should be properly sensible of the danger of our country, free from unmanly dejection, duly apprized of the nature and importance of the contest, anxious to bury all private animosities in a patriotic regard to the public good, strenuous individually to exert ourselves to perform those duties which the exigencies of the state may require, and in the faithful and resolute discharge of these should commit ourselves and our cause to God.

The whole discourse is animated and energetic; and contains such expressions of loyalty, as some would perhaps be surprised to hear from a preacher of the sect to which Mr. Belsham belongs, after all the unmerited obloquy which has been thrown upon it.

ART. LVI. *A Sermon preached on the late Fast Day, at the Parish Church of Hatton, Warwickshire.* By SAMUEL PARR, LL. D. 4to. pp. 31.

ANY work to which the name of Parr is affixed, will justly excite attention; and all that the promise of the publication now before us can have raised, will, by its appearance, be amply gratified. Distinguished by soundness of argument, vigour of expression, loftiness of style, and a liberal and enlightened patriotism, this discourse will not only promote the purposes in aid of which it

was composed and delivered, but contribute to preserve the well earned fame of its author, to a far distant period. Nearly one half of this sermon is occupied in vindicating the gospel from the charge which has been alleged against it, in consequence of the supposed want of all instruction relating to the duty of patriotism. The sum of the preacher's reasoning is thus given by himself:

"If from the national temper and political situation of the Jews and Romans, to whom our Lord more immediately addressed himself, any precept about the love of our country would, probably, have been misconceived by the rash, and abused by the crafty; if the duty itself, in all its essential points, is evidently implied in the injunctions of the gospel, about universal benevolence; if the affection itself is sanctioned by the example of our Saviour, surely we are furnished with a sufficient answer to the severe reproaches of infidels, and the wild misrepresentations of believers. The gospel, in reality, separates the artificial from the genuine virtue. It omits all mention of false patriotism, and by such omission, as well as by the general spirit of its laws, may be said to discountenance it. It includes whatsoever is sound and praiseworthy in true patriotism, under the more comprehensive and more noble duty of charity; and in the life of its blessed author, it exhibits some particular and practical illustrations of that patriotism, which every head may understand, and every heart must feel."

One passage in the course of this reasoning, is worthy of particular attention:

"There is another point of view in which I wish you to consider the subject; for the frequency with which some commands occur in the scriptures, for the earnestness with which they are enforced, and for the phraseology in which they are expressed, satisfactory reasons may be assigned from the known and peculiar circumstances of the world, when our Lord appeared in it. Upon contemplating those circumstances, you will, perhaps, find ample reason for admiring both the wisdom and the humanity of our blessed Saviour, when he abstained from any explicit and positive directions for the love of our country."

"The passion, I am aware, is noble in itself; it takes a strong hold upon some of our best affections; it delights the imagination; it warms the heart; it gathers strength from the instantaneous and instinctive sympathy of every spectator. But, upon all these accounts, it is liable to be abused very grossly and very perniciously, by hurrying us into eager co-operation with the ambitious, and into implicit confidence in the artful.—Hence has often arisen the misapplication of a term, which, in its original sense, was precise; and hence too has proceeded the perversion of a principle, which, in its native character, is most meritorious."

"Now, when our Lord was upon earth, the Roman empire was stretching itself far and wide, and the Roman armies were leagued in a fell conspiracy against the tranquillity and the liberties of the world. The Jews also, among whom he lived, were bigotted to their own religious tenets, to their own ceremonial observances, to their traditions,

to their temple, to their false and proud notions of a Messiah, who was to erect for them a temporal kingdom. Under the influence of that bigotry, misguided by error, and infuriate from zeal, they would gladly 'have bound all other nations in chains,' and, in thus exalting their own country, to the disadvantage, and even with the subjugation of the whole human species, they would have looked upon themselves as instruments, naturally, or it may be, even preternaturally, appointed to accomplish the will, and to promote the glory of God among his favoured people. Amidst such propensities, then, of the Jews, such practices of the Romans, and such wicked passions as were common to both, a precept immediately and earnestly directing men to love their country, would have been soon misunderstood, and soon misapplied. Through the glosses of interpreters, and the blindness of hearers, patriotism would have quickly mounted up to the highest class in the catalogue of virtues. In speculation, it would have been so perverted, as to debase the authority, and to counteract the influence of every obligation to universal benevolence. In practice, it would have produced such ambition in governors, such impetuosity in leaders, and such phrenzy among their followers, as would have plunged them into undertakings wholly inconsistent with common prudence, common equity, and common humanity."

Having shewn what may be really collected from the scriptures of the New Testament, upon this much agitated subject, Dr. Parr proceeds to point out how the friend of religion will prove himself a patriot. He next explains the motives by which he was induced, during the late war, to abstain "from political discussion, and even political allusions, when he addressed his parishioners from the sanctuary;" and justifies his present deviation from what had formerly been his practice. He then calls the attention of his audience to the peculiar and alarming situation of public affairs; and endeavours, in a very eloquent and impressive manner, to excite their confidence, "to animate their zeal, and to direct their conduct, upon an occasion most important to them, in all their various relations, as masters of families, as servants, as parents, as children, as Englishmen, as christians."

From many other equally impassioned and forcible passages, we select the following, as a specimen of the preacher's eloquent efforts to rouse the valiant spirit of his countrymen:

"You, my hearers, are not without your portion in the blessings which I have just

now enumerated. In the present state of society, you go forth in the morning to your daily labours without fear, in the evening you return without inquietude to your homely meals, and through the stillness of the night, you repose in your beds without alarm. But if your enemies were long to prevail, would they not, like the Egyptian task-masters of old, command you to make brick, and to supply yourselves with straw? Would they listen to your complaints, when you 'were hungry and thirsty,' and your souls were fainting within you? Would they suffer you to rehearse, in carols of joy, all the mighty feats, and all the glorious triumphs of your forefathers, in defence of that liberty which is now your own? No; they would not permit your tongues to utter that word, so familiar to the ears, and so captivating to the hearts of Englishmen. They would put out every spark of the holy fire, which now glows in your bosoms. They would force you to endure the scorching sun, and the chilling

frost, but without recompensing your toil. By compulsion you would till the land, and by violence they would reap your harvests, or they would plunder your barns. From the character of freemen and of Englishmen, they would degrade you into vassals, too impotent to be dreaded, and too contemptible to be pitied. Day after day, and year after year, they would condemn you to the most ignominious drudgery, as 'hewers of wood, and drawers of water;' and the agility of your youth, the vigour of your manhood, and even the last lingering remains of your strength, in tremulous and languid old age, would be exhausted at the will, and for the benefit of your imperious and obdurate conquerors. Many of the evils here mentioned already impend over other countries, which are unable to break their chains; and if the power of your enemy were equal to his fierceness, the same evils, attended by various circumstances of aggravation, would inevitably overtake yourselves and your posterity."

ART. LVII. *The Right and Duty of Defensive War: a Sermon preached before a Society of Unitarian Dissenters at Sheffield, on the 19th of October, &c.; to which is added an Appendix, containing some Observations on the French Preparations for Invasion, and on the Mode of National Defence, &c.* By B. NAYLOR. 8vo. pp. 52.

THE words of Jeremiah, ch. iv. 14. "be ye not afraid of them, &c." are so appropriate, that we are not surprised to open a third discourse upon the same text. The sermon now before us is an animated defence of a war undertaken "to repel the meditated attack of a ferocious enemy, whose success would

connect with it the downfall of every thing in this country, which can make life desirable; and with whose defeat the liberties, not only of Great Britain, but of Europe are connected."

We are sorry that we cannot bestow equal praise upon the appendix, in which much objectionable matter occurs.

### MISCELLANEOUS.

ART. LVIII. *Rural Philosophy; or Reflections on Knowledge, Virtue, and Happiness; chiefly in Reference to a Life of Retirement in the Country.* By ELY BATES, Esq. 8vo. pp. 356.

WE have perused this excellent work, the result of mature deliberation, with much pleasure and benefit; and we recommend it to the serious attention of those of our readers especially, whose inclination or whose fortunes lead them to a country life. It owes its existence to the *Treatise on Solitude*, written by Dr. Zimmerman, of which it was our author's "first design to take a summary view; but upon nearer inspection it appeared so little capable of a logical analysis, or reducible to any certain principles, that he rather chose to pursue the train of his own reflections." We have reason to congratulate the public upon this choice. "Zimmerman," as our author justly observes, "was a writer of singular endowments; he possessed great mental sensibility, and a cast of imagi-

nation, which might be thought sublime; but he does not seem to have been equally distinguished by force of reasoning, or solidity of judgment. In his philosophy he appears superficial, and in his notions of virtue wild and romantic; when most favourably estimated, he can rank only as a grave sentimentalist." All the valuable qualifications of Zimmerman have fallen to the share of Mr. Bates, unmixed and uninjured by his errors and defects; his imagination is vigorous, his judgment strong, the philosophy he has embraced is rational, and the notions he has formed of virtue are just and extensive.

We shall endeavour to convey some idea of the nature and importance of this work, by a brief analysis.

The subjects upon which it professes

to treat are, knowledge, virtue, and happiness, in connection with a life of retirement.

Knowledge, the author considers, as embracing *three* objects: the knowledge of God, of ourselves, and of the world. The first, he thinks, may be best obtained in retirement from the world, but not merely by the light of nature: the word of God must be studied with the aid of prayer. The next branch is the knowledge of ourselves; or, in other words, the knowledge of our moral situation. In order to acquire this, "we must know," our author remarks, "the law of our creation, or the duties required of us, and our defection from that law; then we must learn in what degree we should conform to this law, in order to secure our present peace, and final happiness, and in what manner it is most usual for men to deceive themselves upon this subject." In this pursuit, Mr. Bates deems it necessary that we should withdraw ourselves as much as possible from the contagion of error, but that in doing this a just medium should be observed; since when seclusion from society is carried beyond certain limits, it tends to conceal a man from himself, in respect both of his vices and his virtues, his incapacities and his abilities.

"Upon the whole it may appear, that retirement and society are suited to contribute in their turns to self-knowledge. The former, as being peculiarly favourable to the investigation of truth, will supply us with higher standards by which to try ourselves; while the latter is more likely (in some instances at least) to shew us our strength and weakness, and to detect those principles which lie deep and latent in the heart.—What proportion they should bear to each other for the attainment of the end here in view, must be left to every individual to determine for himself, after a due consideration of his particular constitution, his habits and his circumstances."

In a knowledge of the world, Mr. Bates comprises, *first*, the knowledge of its *exterior*, or of its visible manners, with the nature and forms of its business; secondly, the knowledge of its *interior*, or of its secret principles, views, and dispositions; and lastly, of its *value*, or of the rate we ought to set upon the various objects which it offers to our pursuit." As the manners of Englishmen are not fixed and unalterable as those of the Orientals, the recluse is not so well fitted to acquire a knowledge of them as the man

of the world; but in what remains, Mr. Bates conceives he has just claims to superiority; since by attending to his own heart, and diligently perusing the page of history, he may gain as great an insight into the principles and views of the world, as by mixing in its busiest scenes. To know the *value* of the world, the retired man has abundant means; he cannot fail to learn that it is transitory, unsatisfying, and dangerous; and this branch of the knowledge of the world, though attained by few, is the most important of all.

Under this head many very valuable and impressive practical reflections occur. The following passage deserves the serious consideration of those, who, in order to gain, as they pretend, a knowledge of the world, ransack the shelves of a circulating library.

"But of all the mirrors fabricated by the press, and held up to the public, there are none more common, or more fallacious, than those fictitious histories which go under the name of novels and romances, where, for the most part, the modesty of nature is overstepped, where reason is degraded into sentiment, and where human language and human manners are almost lost in rant, affectation, and intrigue. When the world is viewed in such representations it is scarcely to be known again; instead of men and women soberly engaged in business or innocent society, we are presented with a race of beings who have withdrawn themselves into a region of their own, and whose days and nights are wasted in fantastic pursuits, sentimental babble, and mad extravagance. For any one to take his ideas from such exhibitions, would be no less an injustice to the world, than a disgrace to his own understanding.

"Among the many portentous evils that threaten both the present age and posterity, there are few which are more to be deplored than the general diffusion of these visionary writings; for what can be more deplorable than that young persons, instead of being taught to consider the present life as a state of serious trial, where much is to be endured and much to be forborne, should be flattered with the destructive imagination, that its great end is pleasure and amusement? What is more to be lamented, than that, by wrong principles early imbibed, the few days of man on earth should be embittered by perpetual disappointment, and at length terminated by a querulous and miserable old age, without any cheering prospect beyond the grave? This certainly is but ill to know the world even in point of present enjoyment, and to know it still less in its relation to the world to come."

The *second part* of this treatise consists

of reflections on virtue as influenced by a country life.

Human opinions and human passions, Mr. Bates observes, are contagious:

"Hence, if in the mass of human opinions there is less truth than error, and less purity than depravity in the mass of human passions; and if, further, these passions and opinions, by engaging men in an eager pursuit of the same objects, convert public life into a scene of vehement competition (and that all this is the fact, I suppose no attentive and impartial observer will deny); it follows, that the general impression of the world must be unfavourable to truth and virtue; and that retirement, so far as it tends to weaken this impression, is an object of importance to all, and especially to persons of a yielding and infirm character; those, I mean, who, from a facility of disposition or unfixedness of principle, are very liable to be ensnared by false compliances, or, from a weak and irritable habit, to be discouraged at the least difficulty, exasperated at every appearance of opposition, and wounded before they are stricken."

But to all retirement is not advisable: not to those whose imagination is more seductive than their senses; for this faculty can, in the depth of solitude, furnish out more captivating scenes of gaiety and splendour than any which human life actually exhibits: not to those who have a disposition to melancholy; for solitude is the nurse of this sad complaint: not to those to whom, for want of employment, retirement is dull and uninteresting. Aware that retirement must be regarded chiefly as a negative mean of virtue, Mr. B. proceeds to some observations on education. Religion, philosophy natural and moral, and history, are means which tend, by a more direct and positive influence, to the promotion of that desirable end.

Under each of these heads we meet with many judicious and valuable observations. In education Mr. B. is an admirer of Mr. Locke's system; and he has offered some remarks, especially upon the reading of the classical authors, which, though not new, are deserving of serious attention. In religion he is warmly attached to the doctrine of the established church. Of natural philosophy our author observes, that it is favourable to virtue, as it enlarges the mind; gives a taste for intellectual enjoyment; drives away the terrors of superstition; discovers the limitation of our powers, and thus produces humility; and supplies analogies which ob-

viate objections to revelation. Moral philosophy discovers the equity of the divine dispensations, teaches moral obligations and humility, and instructs concerning the true character of the world. History is Philosophy teaching by examples.

Warmly as Mr. B. admires retirement, he is not insensible of the evils to which it is exposed. Amongst these he ranks idleness; humour, or an indulgence of caprice; conceit; incivility; churlishness, and misanthropy. For each of these he suggests the proper remedies.

In the *third* part of his work Mr. B. treats upon *happiness*; which is considered as arising, in a life of retirement, from independence, agricultural pursuits, diversions and scenery. These streams of rural felicity do not always run pure; and our author candidly and judiciously shews the interruptions and the impurities to which they are most commonly liable.

Upon the subject of rural diversions Mr. B. offers the following just remark.

"As it might justly be thought impertinent for one who is no sportsman to undertake to estimate the pleasures of fowling and hunting, I shall dismiss this topic very briefly. It is certain that, in point of present gratification, every pleasure is such as it is felt to be; and therefore, if any one finds himself delighted in wandering through the woods with his fowling-piece, or in scouring the country along with dogs and horses, and desperate riders, to the terror of an innocent quadruped, it would be in vain to dispute against his experience. To what persons, or in what cases, such diversions are allowable, I leave others to determine; and shall content myself to observe, what I suppose none will deny, that, when they are made a principal object, their manifest tendency is to induce an incapacity for nobler enjoyments, and so to lay the foundation of a despicable old age; for it would seem difficult to imagine a character more entirely sunk, and devoid of all respectability, than that of an old worn out sportsman, the vigour of whose days has been wasted in mere animal exertions, and whose memory is stored with nothing better than the history of hares and foxes, of rustic adventures and perilous escapes, and who dreams away the evening of life, like the hound sleeping upon his hearth, in retracing the vain images of his wild and sportive excursions."

The pleasures of a literary retirement come next to be considered—as they arise from the study of history, philosophy and poetry. The section in which these topics are discussed contains much

useful matter, and concludes with the following remark, no less favourable to the heart than to the understanding of the author.

“ A prudent change of studies is indeed no less grateful and salutary to the intellectual, than a change of air or exercise to the animal part of our nature. When the mind is exhausted with long application to scientific or abstruse subjects, she may often find relief in the lighter and more agreeable departments of learning, may expatiate in the interesting field of history, or wander in the flowery paths of poesy; or, if relaxed or scattered, for want of regular exertion, she may apply herself to mathematical, or even to metaphysical enquiries; just as, in regard to the body, it may be proper to climb the hill or to repose in the valley, according to the laxity or tension of the animal system.

“ But, however judicious may be his plan for an interchange of studies, there will be frequent intervals when a wise man will quit his books and his speculations, in order to discharge the duties, and to share the innocent pleasures, of ordinary life; when, instead of passing from Locke or Newton to Homer or Virgil, to Thucydides or Livy, he will retire alike from philosophers, poets, and historians, to visit a neighbour, to enjoy the cheerful conversation of his own fire-side, or, with an infantine spirit, to divert himself with his children. *Non semper arcum tendit Apollo.* Man was formed for social intercourse, as well as for solitary contemplation; and when these ends are pursued in a due manner, they contribute to their mutual advancement.”

The pleasures of devotional retirement are next pointed out; from which Mr. B. passes to the *fourth* part of his treatise, which is intended to obviate a com-

mon objection against a life of retirement, namely, that it destroys or diminishes usefulness. He fairly contrasts the utility of a public and of a private life; and is thus naturally led to the subject of monasteries. Persuaded, as he is, that these institutions were detrimental to religion, he yet laments that they were so indiscriminately destroyed,

“ Especially as they might have been converted to the advantage of the tender sex, who, for want of such retreats, are many of them turned adrift into the wide world, without a guide, and without asylum; and it is to be lamented, that, while the papists are industriously planting nunneries, and other societies of *religious*, in this country, some good protestants are not so far excited to imitate their example, as to form establishments for the education and protection of young women of serious dispositions, or who are otherwise unprovided, where they might enjoy at least a temporary refuge, be instructed in the principles of true religion, and in all such useful and domestic arts as might prepare and qualify those who were inclined to return into the world, for a pious and laudable discharge of the duties of common life. Thus might the comfort and welfare of many helpless individuals be promoted, to the great benefit of society at large; and the interests of popery, by improving upon its own methods, be considerably counteracted.”

The volume concludes with some excellent remarks upon the choice of life. After this review of its important contents, our readers will be prepared to acknowledge that it merits the most earnest recommendation, to those particularly who are placed in the retirement, in favour of which it is composed.

ART. LIX. *A Supplement to a Picture of Christian Philosophy; or Instructions moral, theological, and philosophical, for the Culture and the Practice of Benevolence.* By ROBERT FELLOWES, A. M. 8vo. pp. 54.

IN this little treatise, the author traces the origin of the benevolent affections to a very early period of life; to that which is passed upon the lap and at the breast of the mother. “ There is fixed,” he observes, “ in our hearts, when we come into the world, a latent spark of good-will to others; and this is commonly excited into its first activity, by the sensations of pleasure which we experience at our mother’s breast.” He considers benevolence as being of two kinds:—the passive feeling—and the active habit; on the due mixture of which genuine benevolence depends. If the former prevails—no benevolent exertions

can be expected; “ for we may cultivate sensibility so far as to be too feeble to perform the duties of active charity.” One observation upon this subject is worthy of the regard of the modern novel reader.

“ The reading of novels, particularly those of the more impassioned kind, acts, in some measure, on the affections, as strong liquors do on the stomach; and both, in the end, diminish the natural strength and sanity of the individual. And it happens in novel-reading as well as in dram-drinking, that a degree of excitement higher than the last is perpetually lusted after; till the nerves become languid and dying by excess of stimulus.—The grief of Niobe ended in her being

changed into a stone: Whether there be any thing like a moral allegory in the fable, I shall not say: but, though it may seem paradoxical, yet I believe it will be found true, that the heart of man is, practically never so hard, as when it has reached its extreme point of softness. Too much of artificial sensibility always, at last, terminates in making the affections as insensible, as the stones that pave our streets.—And the mind, that has been tainted, though, only in a slight degree, with that cant of sensibility which has been lately imported among us in such huge masses from the book-shops of Germany, and which some of our modern dramatists, with more success than wisdom, have introduced upon the stage, is soon brought to regard as vulgar and contemptible the duties and offices of humanity. They, whose heads have been turned dizzy by the fume of this intoxicating sensibility, are above the common offices of humanity. They can live and breathe only in the high empyrean of sensation;—and they cannot leave the ideal world of mighty enterprise and gigantic woe

to sooth the ordinary and every-day miseries of their fellow-creatures. No;—they belong to too lofty a sphere to execute the low drudgery of vulgar beneficence.—‘*Dear me!*’ exclaims a fine lady, whose nerves are thrilling with the noxious effluvia of some inflammatory romance, ‘how shocking it would be to soil my hands or to offend any of my exquisitely refined senses, in entering the peasant’s dirty hovel to carry bread to his ragged family!’—No; such paltry occupations were never designed for us;—we will keep mounted aloft in the regions of melting sensibility; and will leave such unbecoming toils to be performed by the dull and insensate part of mankind, who never shed one delicious tear over the enchanting pages of a Goëthe or Kotzebue.”

The directions which are offered for the purpose of leading to the cultivation and practice of true benevolence are just and forcible; such as might be expected from the well-known goodness and abilities of the respectable writer.

ART. LX. *A familiar Conversation on religious Bigotry, Candour, and Liberality, humbly intended as a Persuasive to greater Moderation, Union, and Peace, amongst the Followers of Christ.* By DAVID EATON. 8vo. pp. 64.

IF any considerations can influence the mind of that man who has the temerity to persuade himself that he or his sect is exclusively possessed of religious truth, and the folly to believe that all who subscribe not to the same creed, must “without doubt perish everlastingly,” they are such as are contained in the pages of this small tract. That *Zelotes* should finally yield to the more forcible arguments of *Candidus*, is no other than must necessarily happen, to suit the author’s purpose; but we ac-

knowledge that this does not happen till the contest has been long and fairly carried on. *Zelotes* urges every principle which the character he personates must be supposed to own, and *Candidus* very ably supports the more liberal and christian views which must distinguish the enemy of bigotry. Mr. E. is, however, unfortunate in his title. The length of the speeches gives the work more of the air of *Formal Harangues* than of *Familiar Conversations*.

ART. LXI. *Part the First, of an Address to the Public, from the Society for the Suppression of Vice, instituted in London, 1802. Setting forth, with a List of the Members, the Utility and Necessity of such an Institution, and its Claim to public Support.* 8vo. pp. 106.

THAT the members of this society act from the best motives, we cannot allow ourselves to doubt: but that the institution has all that claim to general patronage, which they here endeavour to prove, we are disposed to deny.

Upon this subject we have much to offer, which will appear with more propriety when the Second Part of the Address shall have been laid before the public.

ART. LXII. *Directions for the Student of Divinity; in a Letter to a Young Gentleman intended for Holy Orders.* By the Rev. JAMES BANISTER, &c. 8vo. pp. 22.

THIS little work principally consists in the enumeration of a catalogue of books, which the author recommends

to the study of a friend entering upon a course of theological reading. For this purpose he conducts his disciple

through the various departments of morals, history, logic, rhetoric, poetry, criticism, metaphysics, (so far as to preserve him from materialism, with which, in the opinion of the author, atheism appears to be necessarily connected) the study of the Old and New Testaments, with the Jewish and Christian revelations, the history of the reformation, and Christian ethics. The authors mentioned under each of these heads are, no doubt, important and valuable; they would form, however, but a scanty library for an enlightened student of modern times, and many writers of equal, and in some of these branches of superior importance, are omitted. Under the first six of these classes no modern works are introduced. As the author has not confined himself to the recommendation of studies strictly theological, we cannot perceive why natural philosophy and history are excluded from his catalogue, since on these sciences are founded our best demonstrations of the fundamental doctrines of religion, the being and providence of God.

We hope that the period will not soon arrive when classical literature shall be

lightly prized; and Mr. Banister has discovered for it a claim upon our regard, which has not perhaps before occurred to many of its votaries. He believes, in short, that it constitutes one of the great bonds of order in society, and best preservatives against the miseries of anarchy. "By the neglect of classical learning in France," he says, "an opening was made for the frothy impiety of Voltaire, the daring atheism of Helvetius, and the hypocritical cant, perverse sophistry, and paradoxical scepticism of Rousseau."

"The principles of these writers," he continues, "gave rise to the late revolution in that country, and guided their leaders through those scenes of rapine, bloodshed, perfidy, and impiety, which we have all beheld with horror, and the effects of which will probably be felt for many generations."

This little tract, consisting of 22 pages, would in other times have formed a four-penny pamphlet; by the help of hot-pressed paper, and other articles of decoration, it is now made a handsome book, at the price of two shillings.

ART. LXIII. *A Sermon, preached at St. Andrew's Church, Plymouth, at the Visitation of R. Barnes, M. A. Archdeacon of Totness, May 27, 1803. By J. BIDLAK, B. A.* 8vo. pp. 29.

THIS is a sensible, liberal, and well-composed discourse, on the importance of the ministerial office, and the duties and character incumbent on those by whom it is discharged. The text (from 2 Pet. i. 12.) appears to have been applied by Mr. Bidlake, not so much to the subject of his sermon, as to his own situation, with reference to the audience to which it was addressed. He first examines the moral situation of the Christian world, and attempts to investigate the causes to which the imperfect operation of Christian principles is to be traced, expressing at the same time a charitable, and, we believe, just opinion, that notwithstanding the acknowledged prevalence of vice, its whole amount may be less, and the sum of virtue greater in the character of mankind, than we are at first sight ready to suppose; and that the actual influence of Christianity, on the moral state of society, is real and important, if not all that we might expect or wish. He concludes, therefore, that neither the moralist nor the divine ought to be discour-

raged; but may be assured, that their labours are productive of much good. He then proceeds to some reflections on the mode of rendering the office of public preaching more efficacious than it is; for which purpose, as the foundation of rational piety, removed from the extremes of superstition and enthusiasm, he directs the Christian minister to impress his mind as much as possible, with enlarged conceptions of the nature and character of the Deity, as the foundation of all subsequent opinion, and a preservative from many dangerous errors. Into controversial topics he advises the preacher rarely to enter, and when employed, to treat them with temper and caution. Condemning a zeal that is without knowledge, he still recommends a necessary degree of earnestness, and the practice of every innocent art of composition and delivery, which may tend to render public discourses attractive; above all, to enforce doctrine by sustaining such a character in life as may give power to instruction, and win by a conciliating conduct. He then vindicates

cates the title of the clergy to the rank which they hold in society, and to the emoluments of their office, as justified by their education, and required by the situation which they are obliged to maintain in life. He concludes by briefly urging on his clerical audience, the sacred obligations which they are

under to devote themselves zealously and disinterestedly to the service of their master, and to "remember that nothing is to them ornamental, nothing good or great, which does not immediately or ultimately conduce to the glory of God, and the salvation of mankind."

## ECCLESIASTICAL HISTORY AND CHURCH DISCIPLINE.

ART. LXIV. *Transactions of the Missionary Society.* Vol. I. 8vo. pp. 516.

THE history of this society is truly characteristic of the Evangelicals: it displays their honourable zeal, and their base superstition; their collective importance, and their individual imbecility; the prodigious means which they possess, and the more prodigious absurdity with which they exert them.

A warm address appeared in the *Evangelical Magazine* for September, 1794, exhorting the "Gospel Christians" to advance the glory of God by attempting the conversion of the heathen. Shortly after, Mr. Melville Horne published his *Letters on Missions*; however little attention this book excited elsewhere, it was reviewed and strongly recommended in the *Evangelical Magazine*. The tinder was ready, and the spark took. Accordingly, a number of "Gospel Ministers" in London, together with some of their country brethren, held every fortnight, during six months, a meeting for prayer and consultation on the most effectual means of commencing and carrying on the missionary work. This led them to insert an address in their magazine, and to send circular letters to ministers in the country. Their provincial brethren, in reply, professed a similar zeal, and offered liberal pecuniary aid. A general meeting was summoned in London. Immense multitudes of all denominations assembled; money was subscribed; missionaries offered themselves; and sermons were preached, which, by their own account, rivalled in success the spiritual trophies of St. Bernard.

The society determined to make their first efforts in the South Sea Islands. Twenty-four single and five married brethren were shipped by the grace of God, and in good condition, on board the good ship *Duff*. The captain and his crew were all god-fearing men, and many of our sailors remember the strange circumstance, that this vessel heaved anchor,

and set sail from Portsmouth, the captain, the crew, and the cargo, all singing psalms. The details of this voyage have been published in a volume, which contains more information respecting the South-Sea islanders, than is to be found in all the volumes of all the navigators, French or English. Two of the missionaries returned to England in the same ship; twelve single and the five married brethren were left at Otaheite; one at the Marquesas, and nine at Tongataboo. This volume commences with the Otaheitean journals, beginning on the day of the *Duff's* departure.

"August 4th, 1797.---This morning the ship *Duff* was got under sail, and lay to without the reef. The boat went off with our dispatches for England, and we took, with tears of love, our last farewell of the captain, officers, and seamen; and stood gazing at that highly favoured ship, in which we had lived almost eight months, and sailed more than twenty thousand miles, over the boisterous deep, till it vanished from our sight; not forgetting to lift up our hearts to God, in fervent prayer, for her protection, and safe passage to our native shore. We also gave ourselves, in a more particular manner, to the Lord, to aid and uphold us in our important undertaking, praying that he may grant us such qualifications, as shall enable us to act with consistency before the poor benighted heathen; and that many may, through our instrumentality, be translated from the power of darkness, into the kingdom of his dear son Jesus Christ. We are now situated in one of the most delightful countries in the world: here the cares and anxieties, which possess the poor man's breast, with respect to the maintenance of his family, require not a thought; but still we have our troubles and anxieties, when we consider our critical situation, upon a small island, many thousands of miles distant from our native country, and surrounded by an uncivilized people. We have, it is true, received from them kind treatment, greatly surpassing what we expected; but from our knowledge of human nature, we have cause to apprehend, that much deceit and covet-

ousness may be mingled with their actions, as well as professions of kindness; and are therefore taught the necessity of some degree of caution in our transactions with them. Probably, we are in no danger at present, from an open attack, as they stand in dread of our fire-arms; but what craft or stratagem they may use to injure us we cannot tell; and, therefore, we keep a guard of two brethren, through the whole of the night, to prevent any sudden alarm."

The Theogony of the Otaheiteans might form as wild a poem as was ever made of the fables of Grecian faith. The general name for Deity, in all its ramifications, is Eatooa. They hold three to be supreme—Tane, the Father; Oromattow, the Son; and Taroa, the Bird or Spirit. So say the missionaries; the prism through which they have looked has probably coloured this, but we fully believe that they have represented it as they have seen it. The other greater Gods, among whom are Orohho, Ochawhow, Tamma, Toaheite and Vaveah, they call *fewhanow po*, the children of night. In the beginning Tane took Taroa, and begat Aveye, the fresh water; Atye, the sea; Awa, the water-spout; Matai, the wind; Arye, the sky; and Po, the night. Next he begat Mahanna, the sun, who was born in the shape of a man, called Oeroa Tabooa, and then the Father ceased from the work of creation. Oeroa had by Townoo (whose origin does not appear) the thirteen months; then she returned to earth, and he embraced the Rock Poppoharra-Harreha, which conceived and brought forth a son, after which the rock returned to its original state, and the Father of the Months himself died and went to dust. The son Tetooboo-amata-hatoo embraced the sand of the sea, and begat a son and a daughter Tee and Oopera, then he also returned to earth. The brother and sister married, and had issue a daughter, Oheera-Reene-Moonoa.—Oopera afterwards fell sick, and requested her husband to heal her, promising in his illness to do the same for him, and thus they should both live forever; but Tee let her die, and married his daughter: their children peopled the earth. The stars they believe to be the offspring of the sun and moon; and when the sun and moon are eclipsed, they suppose them in the act of generation.

Tee, with some reference to this common father, is become the name of the guardian Spirit or Household God.—

Each family has its Tee, supposed to be one of their departed relatives, who for his superior excellencies, has been exalted to an Eatooa or Divinity. This resembles the Kami-worship, the old religion of Japan, and is a part perhaps of all superstitions, from Hero-worship to Saint-worship.

ΑΥΤΑΡ ΕΠΕΙ ΚΕΝ ΤΥΤΟ ΓΕΝΟΣ ΚΑΤΑ ΓΑΙΑ ΚΑΛΥΨΕ  
ΤΑ ΜΕΝ ΔΑΙΜΟΝΕΣ ΕΙΣΙ. ΔΙΟΣ ΜΕΓΑΛΗ ΔΙΑ ΒΕΛΛΑΣ,  
ΕΣΘΛΑ, ΕΠΙΧΘΙΝΙΟΙ, ΦΥΛΑΚΕΣ ΘΝΗΤΩΝ ΑΝΔΡΩΠΑΝ·  
ΟΙ ΕΧ ΦΥΛΑΣΣΕΘΣΙ ΤΕ ΔΙΚΑΣ ΚΑΙ ΣΧΕΤΛΙΑ ΕΡΓΑ  
ΗΕΡΑ ΕΣΣΑΜΕΝΟΙ, ΠΑΝΤΗ ΦΟΙΤΩΝΤΕΣ ΕΠ' ΑΙΑΝ  
ΠΛΑΤΟΔΥΤΑΙ· ΚΑΙ ΤΥΤΟ ΓΕΡΑΣ ΒΑΣΙΛΗΙΟΥ ΕΣΧΟΝ.  
HESIOD.

When in the grave this race of men was laid,  
Soon was a world of holy dæmons made:  
Aerial spirits, by great Jove design'd,  
To be on earth the guardians of mankind;  
Invisible to mortal eyes they go,  
And mark our actions, good or bad, below.  
The immortal spies with watchful care pre-  
side,  
And thrice ten thousand round their charges  
glide;

They can reward, with glory or with gold,  
A power they by divine permission hold.

COOKE'S WORKS AND DAYS.

This tutelary God, the Otaheiteans believe, can inflict sickness or remove it, and can preserve them from a malignant Deity, called Tee also, who has no power but upon earth, and is always employed in mischief. These spirits are very powerful. The remarkable peaked mountain in Taloo harbour, is said to be but a part of what it originally was. Some spirits, from Ulietea, had broken off the other half, and were transporting it down the bay to carry it away; but they were obliged to drop it near the mouth of the harbour, where it now stands conspicuous as a rock; for the break of day had overtaken them, and they walk and work by night.—These household deities are, as may be supposed, more prone to anger than to kindness; for it is the characteristic of superstition to fear the unseen powers, not to love them. Some of the natives told these missionaries that they were afraid to say much to them in censure of Temaree, for fear of the gods which he had in his house, who would come at night when they were asleep and kill them; and when it was attempted to show them that these fears were groundless, they appealed to two Swedes upon the island, if what they said was not true. Pomere, the father of the reigning king, dreamt in the night that his Tee

appeared to him, and told him he must sacrifice a man to him, or he should be angry. In obedience to this he arose, laid hands on the first man he caught suitable to his purpose, and murdered him without hesitation. They put great confidence in dreams, believing that in sleep the soul leaves the body under the care of a guardian angel, and moves at large through the region of spirits.

“And all things are that *seem*.”

In conformity to this faith, they say, my soul was such a night in such a place, and saw such a person. A shooting star they imagine to be the Eatooa.—When a person dies, they say his soul is gone to the night; yet they have a belief, that when the soul departs from the body, it is swallowed by the Eatooa bird who frequents their Morais, and passes through him in order to be purified, and be united to the Deity. The bowels they suppose to be the seat of the soul.

Their idolatry is more refined than that of more civilized nations: they do not believe that there is any inherent power in the idol, nor that it represents the Deity; but that the Deity at certain times enters into it. When the last advices came away, a war was expected upon account of such an idol, which had been stolen by the people of one district from another. This was nothing more than an unhewn log of wood, about six feet long, wrapt up in sundry cloths, and decorated with red feathers. A more complicated object of superstition is the sacred canoe which the missionaries describe.

“It is decorated with various apparatus of idolatry; such as the image of a bird, nearly as large as a goose, rudely formed, and covered with feathers of different colours, into which the poor natives boldly assert their god Ooro delights to enter; a small canopy, fixed over a little stool, under this also they believe their god at times rests himself; the canopy is covered with feathers; a hollow cylinder, about ten feet long, and three feet round, covered with feathers, set upright on the stern of the canoe, which was very lofty—its use we know not;—and various other things. To themselves the sight was very grand and magnificent; to us it could only shew what sin has done, and is doing, and draw forth a desire that they might be saved from such fooleries.”

\* One of our old metrical romances, contains a passage oddly resembling this superstition.

Horn seyed, in thine erber is a tree;

There under is a wall free;

Ygrowen all with yoe;

Though the missionaries disbelieved the actual agency of their spirits at first, after they had remained some time on the island, they also, like the Swedish sailors, attributed to the devil what they were not philosophers enough to explain. We continue, say they, making some advances in the knowledge of the language, and acquaintance with many of their diabolical practices, whereby it is demonstrated they are very deep in the mysteries of Satan's kingdom.

“In the afternoon, hearing that a neighbour, who was oft at our houses, was very ill and dying; brothers Bicknell, Eyre and Henry, went to his dwelling, where they saw the poor man lying on the ground, and seemingly in so great pain as silently forced tears from his eyes. The brethren had not much opportunity of speaking to him, as a priest was present, and chaunting his prayers over him with as much musical harmony as the chaunting ceremony in a cathedral.—These poor heathens thank us but little, when they understand that our message is not to promise them a long temporal life, and an indulgence of sensual enjoyments. Like all other of the children of our first parents, their conceptions of, and desires for good, extend not beyond the present world. In the evening held a prayer-meeting. May it please God to pour out upon all the camp of Israel, a mighty spirit of prayer.

“Dec. 4th.—Warm weather, with a gentle north wind. We hear that the sick man, noticed yesterday, is so far recovered as to be able to walk about. We are informed that the condition the brethren saw him in, was owing to his being cursed by the priest who was chaunting over him for his recovery, and a *râtéerā* in the neighbourhood. These two cursed him because he cursed a canoe which the *râtéerā* is preparing for Poméere. There is such a mystery of iniquity in the execrations used by the natives, that the wisdom which is from beneath is very manifest by them. Though we cannot credit all that is reported concerning them, yet we think that the powers of darkness are busy agents with the execrators, and execrated, in a manner beyond their common influences, and that the bodies of the execrated, are in reality affected thereby.”

The enchantment which they practise to discover a robber is beautifully imagined. A pit is made and filled with water: the priest holding a young plantain-tree in his right hand, utters his prayers over this pit till the spirit of the thief is reflected in the \* water.

"The king's title is *Otoo-noo-ey-te-Atóoā*; the meaning of which we do not clearly understand, but as the word *Atóoā* is used to express the object of worship, it is doubtless as full of arrogancy and pride as is possible. His house is called *Yow-rye*, (clouds of heaven;) his double canoe, *Anóoānooā*, (the rainbow;) his manner of riding on the shoulders of an attendant, *Máhówtā*, (flying;) his torch, *Oowéerā*, (lightning); and a drum that is frequently beating for his amusement, *Pā-zéere*, (thunder.)"

The mythology of Tongataboo, is not so well understood: they believe in Tongaloer the god of the sky, and Fenoulonga the god of the rain. Besides these, they have many others of both sexes, over earth, sea, and sky, acting in their own spheres; and sometimes counteracting one another, as interest or inclination prompts them. They also acknowledge the existence of a great number of strange gods, calling them by the general name of *Fyga*; among whom they rank ours as the greatest: and when they think it will answer their purpose, they readily acknowledge him to be far wiser, and in every respect better than their own; having taught us to make so much better ships, tools, cloth, &c. than they have ever been able to do. They likewise imagine that every individual is under the power and controul of a spirit peculiar to himself, which they call *Odooa*, who interests himself in all their concerns; but is little regarded till angry, when they think he inflicts upon them all the deadly disorders to which they are subject, and then to appease him, the relations and other connections of the afflicted person, especially if he be a chief, beat their faces, *taboo* themselves from certain kinds of food, or cut off their little finger, as an atonement for the sufferer. These sacrifices of atonement, are extended even to life, as in Egypt; and, from the story of *Alcestis*, probably once in Greece. A shocking example occurred while the *Duff* was at Tongataboo. Moomooe being dangerously ill, sent for his son

Colelallo, who lived at some distance, under pretext that he should cut off his little finger to appease the *Odooa*, that so his father might recover. But the old man not deeming this atonement sufficient, had resolved that he should be strangled. Colelallo, on his arrival, was cordially saluted by his elder brother, and then went in to see his father. He was immediately seized by the attendants. Comprehending at once their intention, he told them that if they would use gentler means, he would submit to his father's will; but they continuing their violence, he, by a desperate exertion, beat them off. More men were then called in, and, being assisted by his own sister, they accomplished his death.

The soul, they say, is immediately after death conveyed in a very large fast-sailing canoe to a distant country called *Doobludha*, which is a paradise of sensual pleasures. *Higgolayo*, the god of this happy region, is the greatest and most powerful of all the gods, the others being only his servants. The frequent earthquakes which are felt there they explain by supposing that the island rests upon the shoulders of a mighty deity called *Mowee*, who has supported it for such a length of time as exceeds their conceptions. This heavy burthen often exhausts his patience, and then he endeavours, but in vain, to shake it off. The fear, however, excites a dreadful outcry over the whole country, which lasts some times after the shock is over. They even endeavour to quell his discontent, and reduce him to good behaviour, by beating the ground with large sticks. This fiction is quite classical.

Fama est Enceladi semiustum fulmine corpus  
Urgeri mole hac, ingentemque insuper Actnam  
Impositam, ruptis flammam expirare caminis,  
Et fessum quoties movet latus, intremere om-  
nem  
Murmure Trinacriam.

Their temples appear to be regarded as sanctuaries. During the war, when the enemy were about to land at *Akeefo*,

Rimnild, for the love of me,  
Every day that thou there be,  
To see the water lithe;  
And when thou seest my shadow there,  
Then trowe thou me na mare,  
Then am I bound to wive;  
And while thou seest my shadow not,  
Then changeth never my thought  
For no woman alive.

*Horn Child and Maiden Rimnild.* RITSON'S ROMANCES. Vol. III. 301.

Brothers Shelley and Wilkinson lodged in the spirit's house, Beak and brother Buchanan in a large one near the Fiatoka, both of which were full of people, who were most clamorous during the whole of the night, in their addresses to their false gods; in the morning, the enemy was expected to land, and Maffee ordered Beak and brother Buchanan, to the spirit's house, where they found the other brethren, and a number of women and children, belonging to the chiefs; they continued here for some time, during which many offerings of kavva were brought to Ladoo, and Tallecitoobo, two of their deities, to whom the place seemed to be sacred; among others, Maffee came upon the same business, who seriously advised us to remain where we were, as Ladoo would certainly protect us from every harm: these things raised in our minds some scruples concerning the propriety of our conduct, in seeking shelter in such a place, which we were sure was a refuge of lies, we therefore determined to quit it at all events, and cast ourselves upon the care of our all-sufficient God, whom we knew could not fail us; we accordingly left it in the former part of the day, and returned to our abodes."

If the religion of these islanders had been all with which the missionaries were to contend, their victory would have been easy. Savages are never tenacious of their faith: they care little for the religion of their fathers, because their knowledge of their forefathers is bounded by the memory of man. The whole object of their ceremonies is to deprecate the anger of the gods; they know nothing of them but their power, and feel for them only fear. But when they become acquainted with a nation more advanced than themselves, whose arts are more efficient, whose weapons are more destructive than their own; as they perceive their own inferiority, so do they also acknowledge the strangers gods to be mightier than theirs; and the terror which they felt towards their idols is soon converted into contempt and indignation. Thus it was that the religions of Peru and Mexico disappeared, and that the work of conversion has ever been so easy among the Pagan Africans. Force is even less effectual than intellect in such a conquest: the Roman empire was destroyed by idolaters; but the conquerors submitted to the religion of a people, whom they knew to be wiser than themselves.

The people of Australasia and Polynesia are all in that state of ignorance, credulity, and acknowledged inferiority, which best predisposes them to receive a

new religion. Let us now examine the proceedings of this Methodistic mission.

The day after the Duff had departed from Otaheite, Edea, the king's mother, and the chiefs, were overheard talking of the property which the missionaries possessed, and the propriety of taking it from them. They put themselves in a state of defence, ordered the natives to withdraw from their dwelling, and remonstrated with Edea, who denied the charge, and thus a good understanding was re-established. The journal proceeds with their prayers and preachments, and monthly prayer-meetings, and experience meetings, which are noted down as regularly as if they suspected that the recording angel might not give them credit for the full amount, and therefore kept a check account of their own.

"We have formed an hospital near our house, for the reception of any sick natives that will come, as many of them lie languishing under the venereal disease; a few have come, but the generality of the poor souls seem afraid, or are insensible of our goodwill towards them; some have even expected a present before they would take any thing, and every thing must be sweet, or they think it is not good; and they expect to be cured in three or four days. Oh! may the Lord make us honoured instruments of bringing their souls to Jesus Christ the great physician."

"August 23<sup>d</sup>. Early this morning, discovered an entrance made into the smith's shop, and a number of small, but valuable articles, stolen. The manner of this robbery was somewhat curious, and shews the artifice and cunning of the thief. It is supposed, the man was destitute of a knife, with which he might have cut the lashings of the sticks that composed the walls, as it were, of the shop; and, by so doing, have entered with ten-fold less trouble as well as time; but instead thereof, he digged out the sand, apparently with his hands. (the common spade of the natives), and made a hole large enough to admit himself through, with the articles he had stolen, under the ends of the sticks, which were not less than two feet deep in the ground. This must have taken him some time to complete, and he must have been under continual apprehensions of being detected by the watch, who was walking round the house, and must have passed him at the time. Once the watch's attention was attracted towards the place where the man was at his work; but he had so coiled himself up, in the hole he had digged, that the watch took him for a hog, and left him unmolested. Pitea, the deputy chief of the district, being applied to on the occasion,

he soon recovered the stolen property, and restored it to the society.

"*August 29th.* Another attempt was made upon the blacksmith's shop last night, but without success. The natives that surround us, are as void of gratitude as of principle; and seem, in general, to be watching opportunities to impose upon us. We endeavour to preserve ourselves from depredations, without doing any injury to the depredators, when we have it in our power; thereby manifesting, that we desire to do them good, and not hurt. But our lenity hath been misconstrued into cowardice, by some, and they take encouragement therefrom to animate each other in their evil practices."

During the first three months the brethren were so occupied in settling themselves, that they had little leisure to think of the work which they had undertaken. They did indeed occasionally attempt to converse with old Mannemanne the priest, whom they found very bigoted in his opinions concerning the gods of Otaheite; but from no other authority than, as he says, "My grandfather told my father, and my father told me!" When we can discourse intelligibly, say the brethren, we confute him in argument. At length they began to deliberate in what manner they were to proceed.

"*Nov. 9th.* Some of the brethren, on hearing of various instances of the great barbarity of the natives in murdering their children, having in a private meeting consulted on some means of preventing so horrid a practice, did this evening, at a general assembly of the society, propose the following question: 'Will it be proper for us, as missionaries to the heathen, to attempt the abolition of the horrid custom of murdering infants? and if so, what means should be adopted for the accomplishment of such an end?' The question appearing of great importance, and the evening being too far advanced for a discussion of it, it was moved, 'That a meeting be held the ensuing morning, at five o'clock, at which time we should be free from the interruption of the natives, as well as be under no necessity of concealing Otaheitean names, which might occur in the debate.' Agreed.

"*Nov. 10th.* At the appointed time the society met; and, after prayer, a president was chosen, who requested the brethren, who were the occasion of the present meeting, to lay before the society the subject for consideration. The question proposed last evening was repeated, ('Will it be proper, &c.') To the first part of the query, 'Will it be proper for us, &c.' it was answered by some, 'They could see no impropriety in it, provided it could be done without endangering ourselves, and the cause we are engaged

in; but the latter part of the query, respecting the means for the accomplishment of such an end, probably the querists could answer best. The brethren who called the meeting proposed; 1st. That as the principal persons in the island held us in esteem, we should make use of our interest with them, and request their exertion, for the abolition of a custom which would depopulate their island; and if they should consent to the same, it would be well. 2d. If the chiefs would not agree to our proposals, we would use every means in our power for the suppression of such barbarities in our own district. These propositions met with much opposition from many of the brethren; and after many arguments on both sides, the meeting was adjourned till the following morning, at five o'clock.

"*Nov. 11th.* The brethren met at five o'clock. After prayer, chose a president, and the subject of last morning's meeting was resumed. Many arguments were brought, which shewed their attempt would fail without doubt, as it respected the first proposition; because the chiefs were the promoters of infant murder. And the second proposition was proved to be wholly inconsistent with the characters we sustained, it not being our duty to exercise the least civil authority over the natives, nor even to inflict any corporal punishment on persons who might be taken in the act of stealing from us. It was therefore concluded our duty in this matter to be simply this: To inform the chiefs, when they were assembled, the object of our mission, and point out to them the dreadful consequences of murdering their offspring; and, as a farther inducement, should any of the Aréoie society be prevailed on to save their children, and put them under our care, we would instruct them in our arts, which would make them far superior to their neighbours around them, and more useful members of society. These sentiments being generally acceded to, the meeting closed."

We shall reserve our comments upon the conduct of the missionaries till we have concluded the history of their transactions. Two questions equally curious were next agitated.

"*Nov. 17th.* After evening-prayer, brother Oakes informed the society, it had been much upon his mind, What would be the consequence of an hostile attack upon us from the natives: though he did not apprehend any thing of the kind at present, yet, as he knew there was a difference of sentiment in the society, respecting self-defence, he desired to know how the society would proceed, should such an attack be made? He likewise brought forward an enquiry, If any brother should find himself disposed to marry one of the native women, would it be thought by the society an improper act? It was moved, that a meeting be held to-mor-

ow afternoon, to give these things a particular consideration.

“*Nov. 18th.* Assembled according to last evening's appointment. Opened the meeting with prayer. A president being chosen, brother Oakes was called upon to state his first enquiry; which he did as follows: ‘I should be glad to know how the society intend to proceed, should an attack be made upon us by the natives?’ This question brought on a long debate, in which the brethren being disagreed, it was judged prudent to adjourn the consideration of the subject till the following Monday. Closed with prayer.

“*Nov. 20th.* Brother Main's house being finished, he is gone to it to reside. In the afternoon the society assembled; and, the same order being observed as on Saturday, brother Oakes's enquiry was resumed; namely, What we intended to do in case of an attack? It was answered, our having the muskets on shore, was professedly with no other design than to intimidate the natives, and to intimidate only, without ever firing upon or injuring them; and if an attack was permitted to be made, Query, Would it not be our duty to give up ourselves, and all we possess, to the enemy? This query met with great objections; in consideration of the insults our sisters would probably meet with from such characters as the Otaheiteans are known to be. It was answered, by a brother, Were it not for the feelings he possessed for her women, and the children, he should not hesitate a single moment concerning his duty in the matter. It being therefore deemed necessary, that we should stand upon our defence, in the case of an hostile attack upon us by the natives, it was proposed, That our dwelling be barricaded all round, that if an attack should ever be made, opportunity may be given for a parley; but no one, on any account whatever, to go without the boundary, on pain of being charged with blood-guiltiness, if any native should be shot. This was agreed to, and the meeting closed.

“In the evening the society again met, and order being observed, brother Oakes's second enquiry was brought forward: viz. ‘If any brother should find himself disposed to marry one of the native women, would it be thought by the society an improper act?’ Reference was had to the word of God, by which it was proved to be an unlawful action for any brother to marry a native woman in her present state, an idolatress. It was replied, it ought to be considered, that if a native was not taken in her present condition, there was no alternative, but to remain single, and exposed to all the dreadful temptations with which we were surrounded. To this it was answered, God changes not his mode of government or the accommodation of his creatures, and whatever he calls us to we ought to look to him for strength to endure. It was then requested for the brethren to express their sen-

timents individually, and in order, upon the subject. This was agreed to, and beginning alphabetically, each brother acknowledged, That to marry an heathen woman was directly contrary to the word of God, and resolved, in the Lord's strength, to abide as they were.”

In pursuance of their resolution, the brethren remonstrated with the chiefs upon their practice of infanticide. Peter the Swede, whom they had found upon the island, acted as interpreter, and the chiefs promised to abolish the custom with that perfect coolness which is peculiar to savages and statesmen, when they are uttering a deliberate falsehood. — Their determination respecting marriage led to more consequences. Brother Cock, who had not been present at the discussion, fell into temptation, laid his case before the society, and requested to know if brother Cover might marry him to a young native woman. He was immediately answered in the negative, and informed, that the church had already determined such conduct, in any of her members, to be a departure from the faith. Brother Cock submitted to the decision. At the same time, Peter the Swede asked the society, if the woman he lived with might be baptised and married to him. This also was refused.

In March 1798, the *Nautilus*, of Macao, touched at the island. During her stay, two of the men deserted, and the brethren, being apprehensive that the chiefs would obtain muskets and ammunition for giving them up, as they demanded, determined formally to claim the men, and if they were refused, to forbid the natives from entering upon their district. Four of the missionaries were sent upon this embassy. Before they could execute it, they were robbed and stript by the natives. This terrified the society: they consulted whether or not they should abandon the mission, and eleven, among whom were four of the married brethren, accordingly departed in the *Nautilus*. The seven who remained sent away their arms and ammunition, to prevent them from falling into the hands of the natives, and gave up their public store-room and blacksmith's shop, with all their contents, to Pomere.

They had offered their private property also to Pomere, and it would have spared them much uneasiness had he accepted it, as attempts were repeatedly made to rob them; their alarms, however, for personal safety had subsided.

The district wherein the four brethren had been stript and plundered, was punished, and a petty war broke out in consequence. A native, who had learnt the use of the forge, had taken possession of it for Pomere; and applied the iron which the missionaries had carried over, to making lance heads, more destructive than their own weapons. They themselves were called upon by Pomere to bear arms; but they had determined not to meddle with arms, either for offence or defence. The war was soon terminated, and the journal for a while becomes more interesting.

"Otoo has been of late asking brother Lewis to teach him the Hebrew language, and has been inquisitive to know if the king of England is acquainted with Hebrew. What can have excited such an out-of-the-way desire, in the Otaheitean chief, we cannot tell, unless the strange appearance of the Hebrew characters in some Hebrew book shewn him, caught his fancy; however, as it is probably only a spark of passion, it will soon die away again."

"Otoo and Tatōoa-noce still continue their regal privileges of riding across the shoulders of their attendants; and, however unseemly the custom is, and uncommon, to an European, yet it must be acknowledged they sit as easy, and what is termed graceful, as any expert horseman can on the back of a horse; and although Otoo and Tatōoa-noce are well grown persons, yet their bearers carry them, when travelling, generally a trotting pace. The young king continues friendly to us. Yavva continues to be prepared, as related by Captain Cook, &c. and drank to excess by chiefs and common people. The effects it produces are visible, in some, from the head to the soles of their feet. The eyes of the great yavva drinkers are much blood-shot, sometimes very sore; their skin covered with a great thick scurf, and the soles of their feet chapt or cracked; it also subjects some of them to strong fits. Notwithstanding the filthy manner of its preparing, its nauseous smell, and reputed disagreeable taste, it is as much admired by Otaheitean epicures, as the finest wines produced in Italy or France, are by the most refined sensualist in England."

"*July 2d.* We this morning received information, Edéa has been delivered of a child; and, that according to the inhuman custom of the country, it is destroyed. This is the second infant Edéa has murdered, since our residence on the island. The assigned reason for this abominable custom is, Edéa is of royal blood, the man she cohabits with is of menial birth, should the fruit of their unequal union be permitted to survive, the dignity of the royal family would be

considered as polluted and dishonoured; to prevent which, the savage parent suffers her babe to be strangled as soon as it comes from her womb. The rest of the chiefs of the island, who are of the royal family, follow the example of their head; so that, if any of them (male or female) are connected with persons of inferior birth, all the offspring, issuing from such a connection, are massacred. As every person of inferior class is left to follow his, or her inclination, to save or destroy their children, the number of infants murdered is very great; it being no uncommon thing to destroy the first three a woman has; and if a woman has twins (which is often the case) it is very rare that both are permitted to live. Some of the Otaheiteans are acquainted with the satanic art of destroying the fetus in the womb, on the first discovery of a conception, but this is, in general, attended with bad consequences to those who practise it."

But now that the society was no longer disturbed by external danger, a great internal calamity befel them. Brother Lewis had long been suspected of backsliding: he had been seen kissing the heathen women, and sundry other unseemly actions had been observed; at length, he delivered the following letter to the society:

"Brethren and Sister,

"After a long and great conflict of mind, I now inform you it is my fixed determination to take to wife one of these natives, and abide faithfully towards her until death, thinking it the most eligible step in the present circumstances, all things considered. Dear brethren, although you may be otherwise minded, yet I pray you to remember this, that while in this tabernacle we see but in part, and know but in part; many things might be said on the present subject, but I forbear, submitting the whole to Him who disposeth all events to their final end, and may the Lord order our steps, both yours and mine, to his eternal glory, and our felicity. I hope you will return an answer to this by the bearer.

I remain,

Your's affectionately,  
In the bonds of the gospel,  
THOMAS LEWIS."

August 1st, 1798.

To the Rev. Mr. Jefferson.

"Brothers Eyre, Harris, and Jefferson, considering the above letter too important to give an hasty answer unto, declined sending any. In the evening brother Lewis's letter was read to the society, as also the 21st article of the articles of faith, &c. drawn up on board the Duff, entitled, 'Of marriage;' which article, and brother Lewis's determination,

we each of us deemed very opposite. That such an event would take place, we long have had reason to fear, from brother Lewis's conduct towards the females. About three weeks or a month ago, brother Lewis called brother Harris apart, and privately interrogated him on the propriety of his marrying a native of Otaheite: afterwards he interrogated brother Eyre in the same private manner. Twice or thrice he called brothers Harris and Eyre aside, and questioned them upon the point. At first they seemed favourable to his inclinations upon certain conditions—that he aimed at the glory of God in what he did; and if the person he had chosen had not known man by lying with him, &c. But at the second interview with each of them; (having reflected upon the matter) they objected to the lawfulness of the action, and used arguments to dissuade him therefrom. Brother Eyre having informed brother Jefferson of the substance of his private interviews with brother Lewis, brother Jefferson did, on Saturday, July 7, after evening prayer, desire the society to stop, and mentioning to them the cause of their detention, requested of brother Lewis to say, Whether he was determined to marry an heathen woman or not? He for some time evaded the question, considering (as he said) such a mode of procedure unjustifiable; but in the end he said, he had told brothers Harris and Eyre his mind upon the matter a day or two before; which was—he should drop all thoughts of it for the present. The conversation then turned upon the inconsistency and unlawfulness of the action, for proof of which was produced 1 Cor. vi. 16.: from thence arguing the impropriety of a christian man's marrying an heathen harlot. But brother Lewis would not allow that marriage was there meant, only fornication without wedlock. In reply it was said, however it would apply to whoredom without marriage, it would also apply to marriage with an harlot: and it was at the same time asserted, that from the manner in which the children of the natives are brought up; it is probable that there is not a female on the island, above the age of twelve years, that is not an harlot."

He, however, persisted in his resolution, and having broken the bond of fraternity, Mr. Thomas Lewis was excommunicated by the church of Christ residing on Point Venus, Otaheite.

Brother Cock, the first who had fallen into this temptation, was one of the party who left the island: he had gone to Botany Bay and there relapsed. "Poor John Cock," says one of the brethren with him, "is like the sow that was washed, but now turns to her wallowing in the mire." This was not the case with poor Lewis: he cohabited

with the woman whom they would not permit him to marry, attended worship, and made every effort in his power to be re-admitted to communion with the brethren. This mode of life he continued for more than twelve months, and was then murdered, there is every reason to suppose, by his wife and her relations.

Shortly after this event, brother Harris took an opportunity of quitting the island. This loss was made up by the return of Henry and his family from Botany Bay; but a more afflicting loss befel them: brother Broomhall turned metaphysician, and found out that because the soul did exist, it must necessarily cease to exist!

As they could not confute *Mr. Broomhall*, (for of course he was immediately unbrothered) they excommunicated him. He remained a year longer upon the island, and then left it in the missionary ship, which brought out a reinforcement of eight single brethren. A married brother who escaped from Tongataboo, where three of the society were killed, and where the mission has been of necessity abandoned, has since joined the church of Point Venus, containing now fourteen members, three of whom are married.

Such was the state of the mission in July, 1801, when their journals end. The missionaries have applied to the directors for a reinforcement of at least twenty or thirty brethren, recommending that the major part of the number be married persons. It is not very probable that the directors will attend to this, nor indeed that they should be able to find adventurers. At the outset of the enterprize there were candidates in abundance for the employment. A second cargo was provided with as little difficulty, before any accounts of the proceedings of the first had been received. These were taken by the Bonaparte French privateer, and carried into Spanish America, and nothing remarkable resulted from the voyage, except that the son of an Englishman was christened Ebenezer Gershom. But when a third expedition was to be fitted out it was known that the islands were not flowing with milk and honey. Forty persons were wanted for the work, and only twelve could be found. The directors themselves appear, by their concluding reflections, to have little hope of the success, or rather of the continuance

of the mission. A civil war in Otaheite appears inevitable, and in that case the lives of the missionaries would be in danger. The directors seem to expect that they will be compelled to abandon the island, and in that apprehension express a wish, that as American ships are in the habit of visiting the Pacific, they may have prepared the way for their Transatlantic brethren.

The difficulty of attaining the language is stated by the missionaries themselves as one of their main obstacles. They had been two years on the island when they spoke of it thus :

*“ April 9th. Our growth in the knowledge of the language is still slow, and in many cases uncertain ; which is in a great measure owing to our not being able to catch the sound of the words with that exactness that is necessary. The language abounds with vowels, even more than any navigator who has given specimens of it was aware of. Many words consist of nothing but vowels, and each has a sound ; but the natives utter their words with such rapidity, that it is with the utmost difficulty we can discover the true manner of spelling them ; and when this is accomplished with any tolerable degree of precision, there is as great a labour to arrive at the true sense and meaning of a word, or its various meanings ; for one word is used to express very opposite things in different sentences. And, which adds to the difficulty, they abbreviate their words so much, that those which we are well acquainted with, and which, if fully pronounced, we should readily understand, are by the abbreviation so shortened, that we frequently mistake them for new words, and are thus puzzled and perplexed. However, we have good hopes, that when, by the blessing of God, we have mastered the language, and reduced it to the best order that our skill will accomplish, it will be easy for others to learn.”*

The main cause of failure has been overlooked,—the miserable folly, ignorance, and imbecility, of those who planned and directed the mission. They sent out their missionaries abundantly supplied with fire arms, cloaths, iron, and every implement of European convenience which they could possibly require. These things are more tempting in Otaheite than jewels or gold would be in London, and these treasures they exposed among a people who had the power to plunder as well as the inclination, expecting that they were to be deterred from plundering by being taught the eighth commandment ! The missionaries themselves were poor miserable

methodists, without either common talents or common courage ; so utterly destitute of all plan and all forethought, that after they had been three months upon the island, we find them gravely deliberating whether it would be proper to attempt the abolition of infanticide, and whether they themselves might intermarry with the heathen women.—During the course of four years, they have neither made, nor attempted to make, a single convert, not having in all that time sufficiently acquired the language ; and they honestly confess, that they see no good arising from their residence there. The little good which as Christian ministers they could have done, their sectarian bigotry prevented them from doing. They refused to baptize the woman with whom Peter the Swede cohabited. They refused to marry him to her ; and they afterwards refused to baptize his child, alleging, that the mother was a heathen ! From these applications, it is evident that the Swede respected the forms of his religion, and conceived them to be of essential importance ; it is evident that he had a rooted reverence for the customs of his forefathers, and that he was desirous to teach the child the same prayers and the same creed, which he himself had been taught in childhood. Their refusal could only have proceeded from the uncharitable and unchristian intolerance of their sect, and from that lamentable want of common sense which characterises all their proceedings. A catholic would have gone through fire and water to have sprinkled an infant in the name of Christ Jesus. Let us not be suspected of attributing any mysterious importance to a symbolical ceremony ; what we assert is, that the way to reclaim idolaters is by changing their ceremonies : whatever they believe, so long as they are ignorant, they must believe superstitiously ; while they are ignorant, therefore, too much stress cannot be laid upon the ritual of religion. To expect from them a rational faith, before they are civilized, is as absurd as to suppose they could read Shakspeare before they have been taught English. They must be made, like children, to believe what they are told, merely because they are told it ; but this can only be effected by men of superior and commanding intellect. From this mission no good can possibly result. Let us leave the church at Point Venus to its

speedy dissolution, and pass on to considerations of higher utility.

The enviable state of the Otaheiteans was at one time the theme of general panegyric among our Anti-Christian Philosophists. Happy people, whose food was produced spontaneously, and who had no other object in existence than enjoyment!

The Otaheiteans, and probably all the inhabitants of Polynesia, are a degenerated race: to trace the history of their degradation is impossible, but the fact is certain. Their mythological fables are physical allegory, and imply a degree of observation and knowledge of which at present they are utterly incapable. The cause of their degradation is equally certain. It exists in the very circumstances for which they were envied by the sensual sophists of Europe—their food was produced spontaneously, and they had no other object in existence than enjoyment; therefore do these islanders present to us the awful spectacle of a whole people abandoned to lust, the most intensely selfish, the most brutalizing of all the passions. It is supposed that two-thirds of the children who are born into the world there, are immediately murdered. The *fashionables*, (we may thank the impudence of modern folly for this word of distinction, which implies nothing that either is, has been, or can be, respectable); the *fashionables* of the island are associated together for the purpose of promiscuous intercourse, every female Areoie being bound to procure abortion, or murder every child of whom she may be delivered. These are the customs of the Otaheiteans, of these islanders who have been held up as the exemplars of savage innocence and savage happiness! After these atrocities it would seem trifling to speak of the human sacrifices common in all the islands, and of the *live-cannibalism* of Tongataboo.

In this state of sensuality, the most abandoned and most atrocious, were they discovered by the Europeans. Let the missionaries relate the consequence.

“Jan. 31st. Among the natives around us are many objects of compassion, whose bodies are wasting with disease, and their souls hurrying into eternity in a state of the utmost insensibility. It is surprising what havoc disease has made since we have been on the island. Matavai is almost depopulated, in comparison to what it once was, according to the accounts given by the na-

tives; and not only this district, but the whole island. Stout men are cut down in a few months; women and children share the like fate. They say the disorder that makes such havoc among them came from England; and we have told them repeatedly that it is owing to the wickedness of their women, in prostituting themselves to the sailors of the vessels that come here. They understand what we say, and assent to the truth of it, but their hearts are so set upon covetousness, that the appearance of a vessel effaces all remembrance of the evils they have suffered, and are suffering; and they burn with a desire to obtain something, if it is but a rag; this induces husbands to prostitute their wives, and parents their children.”

Thus have these “merciless murderers of children been tormented with their own abominations.” We have carried among them not the comforts of civilization, not the improvements of science, not the blessings of the gospel; but instead thereof we have communicated to them that tremendous disease which seems to have well nigh done its work in Europe, and is now dispensed more severely to scourge or destroy this “cursed seed,” who perhaps, like the Canaanites, are no longer to be suffered to pollute the earth.

The skill and industry which they possessed when first discovered, has materially declined. “So important,” says Vancouver, “are the various European implements, and other commodities, now become to the happiness and comfort of these Islanders, that I cannot avoid reflecting with Captain Cook on the very deplorable condition to which *these good people* on a certainty must be reduced, should their communication with Europeans be ever at an end. The knowledge they have now acquired of the superiority, and the supply with which they have been furnished of more useful implements, have rendered these and other European commodities, not only essentially necessary to their common comforts, but have made them regardless of their former tools and manufactures, which are now growing fast out of use, and I may add equally out of remembrance. Of this we had convincing proof in the few of their bone or stone tools or utensils that were seen among them: those offered for sale were of rude workmanship and of an inferior kind, solely intended for our market, to be purchased by way of curiosity. I am likewise well convinced that, by a

very small addition to their present stock of European cloth, the culture of their cloth-plant, which now seems much neglected, will be entirely disregarded, and they will rely upon the precarious supply which may be obtained from accidental visitors, for this and many other of the most important requisites of social life."

The only atonement which can be made to this wretched people, for the injury we have done them, and the disease we have communicated, is to communicate also our religion, our morals, and our knowledge; our religion foremost and first, not only as of first importance, but as the necessary and only possible means of imparting morality and science. This is to be done by colonization and by force. England is indeed neither peopled nor cultivated in any due proportion to its extent, but its population is already too great for its system of society. There exists not a single profession, trade, or calling, which is not overstocked with adventurers; colonization is the remedy for the miseries which befall the unsuccessful, and for the crimes which arise in consequence. In these islands there is no pestilential climate to encounter; and it would be insulting the reader to prove the right of conquest,—the right of conquering cannibals and child-murderers! the right of preventing human sacrifices by force!

Shame be to the despicable statesman, who regretted the colonization of America, because the United States renounced their allegiance to Great Britain! his understanding must have been as contracted as his heart. We could say much upon this very interesting and very important subject; but to enter into it fully, and treat it as it should be treated, would far exceed the limits of a review. It would be unjust to these poor simple missionaries, not to acknowledge the value of the information which they have communicated in this volume. The book before us, with all its oddities, contains more in matter, in kernel as well as shell, than many a modern quarto.—They are honest zealous men; and we have only to regret, that their zeal has not been accompanied with more knowledge, or directed with more wisdom.

\* \* \* \* \*

The remainder of this volume relates to a mission in South Africa, which has been far more wisely conducted, and which promises well. In this the main

agent has been Dr. Vanderkemp, a Dutchman of most extraordinary abilities and character. This person studied at Edinburgh, has served in the army with distinction, and has since practised medicine; he is versed, not merely in the usual modern and ancient languages, but also in oriental learning, and in the Gaelic. His own history of his infidelity and conversion is very curious: he was an infidel of Lord Herbert's temper, disbelieving whatever his reason rejected, yet praying to be cured of this disbelief; "waiting upon God, that he would take him by the hand, and lead him in the way everlasting."

You will have observed, says Vanderkemp, that when the Lord Jesus first revealed himself to me, he did not reason with me about truth or error, but attacked me like a warrior, and felled me to the ground by the force of his arm. On this extraordinary narrative we need offer no comment; it will be equally intelligible to the reasoner and to the miraculist. This particular affection in no degree changed or weakened his general powers of mind; it disposed him to become a missionary, and he entered upon the work with such qualifications, both of body and mind, as perhaps never were, and never will be found again in one so disposed. By his exertions, a missionary society was raised in Holland, to co-operate with that in London, and another at the Cape; to which place he was accompanied by one Dutch, and two English associates. The colonists behaved to these missionaries with unexampled liberality: they gave the two who went among the Boschemen eleven oxen, one hundred and eighty sheep, seven cows and a calf, with poultry and other stores, says the journal, too numerous to mention. Vanderkemp twice entered Caffraria, and has brought back a more ample vocabulary of their language, and a better account of the people than can be found in any former traveller. We cannot speak too highly of this indefatigable man. The English government, at the Cape, entertained a due sense of his merits, and of the usefulness of his object. Under their auspices, he has founded a Hottentot settlement near Algoa bay, upon a plan not unlike the Jesuit establishments at Paraguay. The Dutch government has since promised to protect and encourage the missionaries; and by what has been done, there seems little reason to doubt,

that much good will be produced by their exertions. We regret that our limits will not permit us to enter into a minuter account of the mission.

Before the war broke out, the society were exerting themselves to diffuse their principles in France and Italy. The scriptures were to be printed in French and Italian, with Watts's and the assemblies' catechisms, in such numbers, that if the one-half should reach Italy, the Pope may make his next year's bonfires entirely of heretical paper.

We will not conclude this article without noticing a very remarkable circumstance relative to the propagation of christianity. It has been asserted, in the public papers, that in certain of our West India islands, the missionaries have been forbidden to attempt the conversion of the negroes. If such tenets as they inculcate can any where be useful, it must be in those accursed islands, where the sight of a plantation would soon reconcile the most scrupulous humanity to the doctrine of fire and torments for the

wicked. Disbelief produces very different effects in Europe and in America. The esoteric atheism of a European metaphysician is only injurious to himself: but the disbelief or disregard of a God in the sugar islands, converts the planter into the image of the devil. The denunciation of eternal punishment may not awaken him, but it will at least console his victims; it will teach them hope as well as patience, and infuse one drop of comfort into their cup of bitterness. If the circumstance which we have stated be true, it is incumbent upon our bishops to inquire into it. We have one set of laws for the sugar islands, and another for England; one set of feelings, one set of morals for each: it would then be seen if, in our liberality, we are to allow them a different religion also. It would then be seen, whether those worthy, and noble, and royal legislators who, in their humanity, voted away the bodies of the negroes, would also, in their piety, vote away their souls.

LXIII. *A Chronological History of the People called Methodists, of the Connexion of the late Rev. John Wesley; from their Rise in the Year 1729, to their last Conference in 1802.* By WILLIAM MYLES. 12mo. pp. 348.

“ MY reasons for publishing this history are, 1. It appears to me to be absolutely necessary, in order, that if a stranger should enquire what are the principles of the methodists, as to their doctrine, morality, politics, œconomy? how are they governed? what is the nature of their religious government? how is the work supported? what are their designs? what methods do they take to accomplish their designs? what is their success? who are their preachers? what effect Mr. Wesley's death had upon the body at large, and the preachers in particular? he may have a satisfactory answer to all these enquiries from their most authentic records. 2. I wished to shew the methodists what great things the Lord hath done for them; how from very small beginnings they became a very numerous, useful, holy people, owing to the Lord's blessing on his gospel preached among them.

“ The methodists I divide into three generations: The first, those that joined the society from the year 1739 to the year 1765; most of these are gone to their eternal reward; the few that remain are worthy of double honour, and I would wish to stir up their pure minds by way of remembrance, by calling them to consider former times and persons, in order that their gratitude to, and confidence in the Lord may be thereby increased. The second generation are those that joined the society from the year 1765 to 1790; from this body we at present derive

most of our steady, active, useful members. To these I present this history, that they may know without much labour, the rules by which we all act. The third generation are those who have joined the society since Mr. Wesley's death, in the year 1791. A numerous and a promising race of christian men and women. I wished to shew these the origin and progress of methodism.— 3. That they may all see at what time these regulations took place, and those rules were made, which, under God, have been instrumental in preserving so numerous a body united together. 4. To shew, that though our doctrines have been the same from the first, and, as we think, purely scriptural, the same which the *primitive christians* held for the *three first centuries*, and also agreeable to the *liturgy, articles and homilies of the established church*; yet with regard to our discipline and œconomy, we have been in a regular state of improvement from the first conference in 1744, to the last in August 1802.”

This volume is no subject for criticism. ‘Plain truth for plain people’ is the author's motto, and we will make it our text. We will use the book as the future historian of England must use it, and extract therefrom a detail of the Rise and Progress of Methodism.

John Wesley was born in 1703: he graduated at Christ-church Oxford, was

ordained by the bishop of Oxford, and elected fellow of Lincoln college. While at the university, he became deeply serious; this disposition he communicated to his brother Charles: they received the sacrament weekly, and obtained two or three proselytes to this practice, and to the regular course of living which they observed. The title methodist was given to Charles Wesley, in ridicule of this regularity, by a fellow of Merton, alluding to the Roman school of physicians, so called from the regimen which they always enjoined. The removal of John to a curacy, suspended for a while the growth of the society; Charles however again renewed it, and John returning to Oxford in 1729, resumed the whole management; no very arduous task, for besides himself and his brother, it consisted of only two persons. Certain pupils of the Wesleys soon requested permission to attend at their meetings. In 1732, Clayton, a tutor at Brazen Nose, joined them with some of his pupils also, and by his advice they began to observe Wednesday and Friday as fasts, after the custom of the ancient church. In 1735, George Whitfield of Pembroke was added to the number; "at that time they were fourteen or fifteen in number, all collegians, of one heart and mind, and must be considered as the first methodists;" they formed rules for the regulation of their time, their studies, reading the scriptures, and self examination; they visited the sick and the prisoners, and received the Lord's supper every week.

In 1735, Wesley began the custom of extempore preaching in consequence of this accident; he went to All Hallows church in Lombard-street, to hear Dr. Keylin, and the doctor not coming, the church-wardens requested him to preach: he complied though he had no notes: this habit was for several years regarded as a very uncommon and wonderful thing. This year he embarked for Georgia in America, as a missionary, and there became acquainted with the Moravians. With the Indians he could do little; but so many of his own countrymen met weekly at his house in Savannah, that he considered this as the second rise of methodism. Here he and his companions, Ingham and Delamotte, agreed,

"1. To advise the more serious among them to form themselves into a sort of little society, and meet once or twice a week, in order to improve, instruct, and exhort one

another. 2. To select out of these, a smaller number, for a more intimate union with each other, which might be forwarded by him and his friends, conversing singly with each, and altogether at his house. And this accordingly they determined to do every Sunday in the afternoon. Here we see the first rudiments of classes and bands, which have had no small influence in promoting the success of the methodists, beyond any other denomination of christians, not immediately favoured by the civil power.

"In the beginning of August 1737, he joined with the Germans in one of their love-feasts. This I believe was the first time he ever saw a love-feast. He speaks thus of it: 'It was begun and ended with thanksgiving and prayer, and celebrated in so decent and solemn a manner, as a christian of the apostolic age would have allowed to be worthy of Christ.' He afterwards introduced love-feasts into the œconomy of methodism. At first they were for the *bands* only, *i. e.* small companies of true believers. Afterwards the whole society were permitted to partake with them. They are conducted in the following manner:—The meeting begins with singing and prayer, after which the stewards distribute cake and water. A collection is then made for the poor; afterwards liberty is given to all present to relate their religious experience, which is generally made a blessing to all. The meeting continues nearly two hours, and is concluded with prayer."

He returned to England in 1738.—Till now Wesley had always used a form of prayer, but now visiting a condemned criminal at Oxford, he prayed with him extempore to such good effect, that the man rose up and said, now I am ready to die. On May-day, in this year, he and some Moravians formed themselves into a religious society, which met at Fetter-lane; this he called the third period of methodism.

"The rules which were agreed on were:—1. That they would meet together once a week, to confess their faults one to another, and to pray one for another that they might be healed. 2. That the persons so meeting should be divided into several bands, or little companies, none of them consisting of fewer than five, or more than ten persons. 3. That every one in order should speak as freely, plainly, and concisely as he could, the real state of his heart, with his several temptations and deliverances, since the last time of meeting. 4. That all the bands should have a conference at eight every Wednesday evening, begun and ended with singing and prayer. 5. That any who desired to be admitted into this society should be asked, What are your reasons for desiring this? will you be entirely open, using no kind of reserve? have you any objection to any of our orders? (which were then read.) 6.

That when any member was proposed, every one present should speak clearly and freely whatever objection he had to him. 7. That those against whom no reasonable objection appeared, should be, in order for their trial, formed into one or more distinct bands, and some person agreed on to assist them. 8. That after two months trial, if no objection then appeared, they should be admitted into the society. 9. That every fourth Saturday should be observed as a day of general intercession. 10. That on the Sunday seven-night following, should be a general love-feast, from seven till ten in the evening. 11. That no particular member should be allowed to act in any thing, contrary to any order of the society; and that if any persons after being thrice admonished, did not conform thereto, they should not be any longer esteemed as members."

Members were classed in bands according to their different degrees of attainment in divine life, men and women; the single and the married separately. This institution was adopted from the Moravians. The rules of the band societies were drawn up in 1738, with this title, "Orders of a Religious Society met together in Obedience to that Command of God, by St. James, c. 5. 16. Confess your faults one to another, and pray one for another that ye may be healed. The following are the rules :

"Questions to be proposed to those who desire to be admitted into the bands :

"1. Do you enjoy the knowledge of salvation by the remission of sins? and have you the peace of God in your conscience?— 2. Have you the love of God shed abroad in your heart? 3. Have you the Spirit of God bearing witness with your spirit, that you are a child of God? 4. Has no sin, inward or outward, dominion over you? 5. Do you desire to be told of all your faults, and that plainly? 6. Do you desire that each of us should tell you whatever we think, or fear, or hear concerning you? 7. Do you desire, that in doing this, we should come as close as possible; that we should search your heart to the bottom? 8. Do you desire, that each of us should tell you from time to time, whatsoever is in his mind concerning you? 9. Is it your desire and design, to be on this and all other occasions, entirely open, so as to speak every thing that is in your heart, without exception, without disguise, and without reserve?

"Our design is,

"1. To meet once a week at the least. 2. To come punctually at the hour appointed, without some extraordinary reason.— 3. To begin exactly at the hour, with singing or prayer. 4. To speak each of us in order, freely and plainly, the true state of our souls, with the faults we have committed in

thought, word, or deed, and the temptations we have been exercised with since our last meeting. 5. To end each meeting with prayer, suited to the state of each present. 6. To desire some person among us to speak his own experience first; and then to ask the rest in order, as many, and as searching questions as may be, concerning their state, sins, and temptations. Such as—1. Have you been guilty of any known sin since our last meeting? 2. What temptations have you met with? 3. How were you delivered? 4. What have you thought, said, or done, of which you doubt whether it be a sin or not?"

This year he first received assistance from a lay preacher: the ensuing is an important epoch in methodism. On the second of April, Wesley being denied the use of the churches in Bristol, preached for the first time in the open air: the same means were resorted to in London in consequence of the same exclusion, and this may be considered as the beginning of his itinerancy. The first methodist meeting-house was built this year at Bristol. Wesley had settled it on eleven feoffees, but Whitfield observed to him, that as these men had the power of appointing the preachers, they could even turn him out, if what he said or did should not be pleasing to them. He immediately called them all together, cancelled the writings, and took the whole management respecting the building into his own hands; "believing," as he said, "that the earth was the Lord's, and the fulness thereof, and in his name he set out nothing doubting." We see, says the author, that from the beginning he thought the only possible way for the work of God to continue as it had begun, was by his having the appointment of the preachers in all the chapels under his care.

In this same year 1739, the methodist school at Kingswood was begun, and a meeting-house opened in London, and now the mother society was formed. The rise is thus related by Mr. Wesley:

"In the latter end of the year 1739, eight or ten persons came to me in London, who appeared to be deeply convinced of sin, and earnestly groaning for redemption. They desired, as did two or three more the next day, that I would spend some time with them in prayer, and advise them how to flee from the wrath to come, which they saw continually hanging over their heads. That they might have more time for this great work, I appointed a day when they might all come together, which from thenceforward they did every week, viz. on Thursday in the

evening. To these, and as many more as desired to join with them, (for their number increased daily) I gave that advice which I judged most useful for them, and we always concluded the meeting with prayer, suited to their several necessities." This was the rise of the methodist society, first in London, then in other places. Such a society is no other than "a company of persons, having the form and seeking the power of godliness, united in order to pray together, to receive the word of exhortation, and to watch over one another in love, that they may help each other to work out their salvation." It appears from this account that he did not consider this as a division from the established church, but simply as a religious society.—It was not till May 1, 1743, that he and his brother Charles drew up rules for the united societies. This period must be considered as the *fourth* in methodism."

Schisms now began: the Moravians and methodists differed concerning the nature of faith, and how to attain it; the Moravians taught that there were no degrees of faith, and that the way to attain it was to be still. Wesley asserted that there were degrees, and that it was to be gained by constantly attending on all the ordinances of God. This was the first separation; the next was of more importance. Whitfield and Wesley differed concerning unconditional election, irresistible grace, and final perseverance. The second separation took place, and the methodists were divided into Calvinists and Arminians, the latter being now known by the name of Mr. Wesley's connection.

"In 1742, the societies having greatly increased, were divided into *classes*, each class consisting of twelve persons or more, who were committed to the care of one person styled the leader. Mr. Wesley thus records the occasion of this:

"Feb. 15, 1742, he observes, "many were met together at Bristol to consult concerning a proper method of paying the public debt contracted by building, and it was agreed: 1. That every member of the society that was able should contribute one penny a week. 2. That the whole society should be divided into little companies or classes, about twelve in each class. 3. That one person in each should receive the contribution of the rest, and bring it in to the stewards weekly. Thus began, says he, that excellent institution, merely upon a temporal account, from which we reaped so many spiritual blessings, that we soon fixed the same rule in all our societies.

"April 9, 1742, the first watch-night was held in London. The service at these times begins at half past eight o'clock, and continues till midnight. The custom was begun

at Kingswood by the colliers there, who, before their conversion, used to spend every Saturday night at the ale-house. After they were taught better, they spent that night in prayer. Mr. Wesley hearing of it, ordered it first to be once a month, at the full of the moon, then once a quarter, and recommended it to all his societies.

"His account of it is, "I was informed, that several persons in *Kingswood* frequently met together at the school, and (when they could spare the time) spent the greater part of the night in prayer, and praise, and thanksgiving. Some advised me to put an end to this: but upon weighing the thing thoroughly, and comparing it with the practice of the ancient christians, I could see no cause to forbid it. Rather, I believed, it might be made of more general use. So I sent them word, "I designed to watch with them, on the Friday nearest the full of the moon, that we might have light thither and back again." I gave public notice of this the Sunday before, and withal, that I intended to preach, desiring they, and they only, would meet me there, who could do it without prejudice to their business or families. On Friday abundance of people came. I began preaching between eight and nine, and we continued till a little beyond the noon of night, singing, praying, and praising God."

"In this year commenced also in London the visitation of the classes, once a quarter, by the preachers, which gives them an opportunity of conversing four times every year with the people, concerning the state of their souls; as also of ascertaining who continue to be real members, by giving to each person a ticket, with a text of scripture on it, as a mark of their approbation. This is now universally practised, and the ticket is the same in every place. On the band tickets the letter B. is marked. The increase of the societies, together with the probable supposition that improper persons would endeavour to come among them, led to this prudential measure."

Visitors of the sick were now appointed. The visitor is to see every sick person within his district thrice a week, to enquire into the state of their souls, and advise them as occasion may require; to enquire into their disorders, and procure advice for them; to relieve them if they are in want; to do any thing for them which he or she can do; to bring in his account weekly to the steward. The rules given to the visitors were only these:—Be plain and open in dealing with souls; be mild, tender, patient; be cleanly in all you do for the sick; be not nice.

The first conference was held at London in 1744; Wesley invited the persons who attended, and presided among

them, nor could any conference be held unless he were present, or had appointed a deputy. The advantages of this yearly meeting are stated to be, that it brings the preachers into a closer union, quickens their zeal, and terminates their disputes; and, by changing them from one circuit to another, it proves a blessing to the people, giving them the benefit of the gifts and abilities of the preachers in general, while it gratifies an innocent curiosity. Of the minutes of this conference, this part is important.

“Q. Do we separate from the church?  
A. We conceive not: we hold communion therewith, for conscience sake, by constantly attending both the word preached, and the sacraments administered therein.

“Q. What then do they mean who say, ‘you separate from the church?’—A. We cannot certainly tell; perhaps they have no determinate meaning, unless by the church they mean themselves; *i. e.* that part of the clergy who accuse us of preaching false doctrine. And it is sure we do herein separate from *them*, by maintaining that which they deny.

“Q. But do you not weaken the church?  
A. Do not they who ask this, by the church mean *themselves*?—A. We do not purposely weaken any man's hands, but accidentally we may thus far:—they who come to know the truth by us, will esteem such as deny it, less than they did before. But the church in the proper sense, the congregation of English believers, we do not weaken at all.

“Q. Do you not entail a schism on the church? *i. e.* is it not probable that your hearers after your death, will be scattered into all sects and parties? or, that they will form themselves into a distinct sect?—A. 1. We are persuaded that the body of our hearers will even after our death remain in the church, unless they be thrust out. 2. We believe, notwithstanding, either that they will be thrust out, or that they will leaven the whole church. 3. We do, and will do, all we can to prevent those consequences which are supposed likely to happen after our death. 4. But we cannot with a good conscience neglect the present opportunity of saving souls while we live, for fear of consequences which may possibly or probably happen after we are dead.”

The select society, or band, was instituted in 1745; the persons admissible were “those who were earnestly athirst for the full image of God, those who continually walked with the Father, and with his Son Jesus Christ.” Nothing spoken in this society was to be repeated out of it. “I could say freely to these when they were met together,” says Wesley, “ye may all prophesy one by

one, (taking that word in its lowest sense) that all may learn, and all may be comforted.” The writer of this history expresses his regret, that so few of the people embrace this privilege, and that every preacher does not warmly espouse such profitable meetings.

In 1747, the rules for the stewards were drawn up. Their business is somewhat more than the name implies. Besides receiving and expending the funds of the society, and sending relief to the poor, they are to inform the minister if any of the rules of the society are not punctually observed, and to tell the assistants, in love, if they think any thing amiss either in their doctrine or life.

During all this period, and for many years afterwards, the preachers received no money except what individuals voluntarily bestowed upon them, and a little from the stewards for their travelling expences; in consequence, some popular preachers possessed abundance, while others were comparatively destitute. In 1752, it was determined that they should receive a yearly stipend of twelve pounds; in 1800 it was increased to sixteen. About this time two eminent preachers got independent congregations for themselves, and forsook the itinerant plan; but it was probable that they would not have ceased to travel, if there had been a provision for their families. This led to an allowance for preachers wives, at first of four shillings weekly.

The ceremony of renewing the covenant was the next device which Wesley invented or adopted. The words of a covenant to serve God, as given by Richard Allen, are recited in the meeting, and the people hold up their right hands in token of assent. This is now generally practised in all the larger societies, on the last night of the old, or the first Sunday of the new year. It is generally, says the writer, a very solemn sermon, and productive of blessed effects.

A great revival of religion, as it is called, took place among the methodists in 1760. Many persons, men as well as women, professed that they were cleansed from all unrighteousness, and made perfect in love, in a single moment, often while hearing the word, but more frequently while at prayer, or while others were praying for them. The latitude thus knavishly given to folly, fraud and frenzy, led to frequent extra-

vagancies, and sometimes occasioned petty schisms; but Wesley called this the glorious work of sanctification, his pentecost, the perfecting of the saints.

Though the permission of lay preachers was a chief characteristic of Wesley's institutions, he thought that no person should administer the ordinances of God without ordination; and as the English bishops had refused to ordain his preachers, he applied to a Greek, Erasmus, the bishop of Arcadia in Crete, who visited London in 1763, upon the principle, that whoever is episcopally ordained, is a minister of the church universal, and as such has a right to officiate in any part of the globe.

For this conduct he was publicly attacked by Mr. Toplady, who in his pamphlet asked him, did you, or did you not, *strongly press* this supposed Greek bishop to consecrate you a bishop at large? In the reply which was published by Wesley's consent, this query was thus answered:—"No. But suppose he had, where would have been the blame? Mr. Wesley was connected with a number of persons who have given every proof which the nature of the thing allows, that they have *an inward call* to preach the gospel; both he and they would be glad if they had *an outward call too*, but no bishop in England would give it them; what wonder then if he was to endeavour to procure it by any other innocent means?" The establishment of the independence of America afforded Wesley a fair opportunity for assuming episcopal power; from the time of the peace, the new civil government was universally acknowledged, but no ecclesiastical authority of any kind was either exercised or claimed by any person whatsoever.—During the war the methodist societies there had been deprived of the ordinances of God, baptism and the Lord's supper, the clergy of the church of England having been generally silenced, or having fled to England; they therefore applied to Wesley after the peace, and he, without scruple, then performed the ceremony of ordination, because if the English bishops had then been willing to do what they had before very properly refused, some confusion might have arisen from the authority of an English hierarchy over an American clergy. The Americans submitted willingly to Wesley's supremacy, but they changed the title of superintendent, by

which his higher ministers were called, into that of bishop. Some displeasure arose that Wesley should act thus episcopally; but the majority of his followers regarded his extraordinary call, and were satisfied. He soon proceeded to ordain for Scotland, and then for England.

To connect together the societies into one general union, the assistants or superintendants, as they are now called, were instituted. This office resembles that of pastor, elder, or bishop in the primitive church, except that the superintendants are itinerants. Their business is,

"1. To see that the other preachers behave well, and want nothing. 2. To visit the classes quarterly in each place, regulating the bands, and delivering new tickets. 3. To keep watch nights and love feasts. 4. To take in, or put out of the bands, or society. 5. To hold quarterly meetings, and therein diligently to enquire both into the spiritual and temporal state of each society. 6. To take care that every society be duly supplied with books, and that the money for them be constantly returned. 7. To send from every quarterly meeting a circumstantial account to London of every remarkable conversion, and of every one who dies in the triumph of faith. 8. To take exact lists of the societies every *Easter*, and bring them to the next conference. 9. To meet the married men, the married women, the single men, and the single women, in the large societies, once a quarter. 10. To see that every society have a private room, and a set of the *library* for the helper. 11. To write an account to Mr. Wesley of all the defects of the helpers, which they themselves cannot cure. 12. To travel with Mr. Wesley, if required, once a year, through the societies in his circuit."

No one was admitted to exhort in any of the societies, without a note of recommendation from the superintendants.—The office of the helper or preacher was also now distinctly marked out.—He is,

"1. To expound every morning and evening. 2. To meet the united society, the bands, the select society, and the penitents every week. 3. To visit the classes once a quarter. 4. To hear and decide all differences. 5. To receive on trial, for the society and bands, and to put the disorderly back on trial. 6. To see the stewards, the leaders, and the school-masters faithfully discharge their several offices. 7. To meet the leaders of the bands and classes weekly, and the stewards, and to overlook their accounts."

Wesley's authority was at one time endangered by the offer of a dubious

alliance. Certain of the clergy were willing to unite with him, provided the exclusive superintendence of the societies in their parish were left to them. Even Charles assented to this demand as reasonable; and declared, that if he were a parish minister, the preachers should not preach in his parish. The business was discussed in the conference of 1764, where twelve clergymen attended. Wesley insisted upon his supremacy, the preachers unanimously agreed with him, and as these clergymen would not unite with him except upon their own terms, the projected union was abandoned. He was right: federalism would have been too loose a tie; his object was to establish a methodist republic, one and indivisible, and to be chief consul of it himself as long as he lived.

Even his own people wished to curtail his power. Wesley ably defended it: he pointed out how it had gradually arisen. The first persons who desired to flee from the wrath to come, came to him to request that he would advise and pray with them; here began his authority to appoint where and when, and how they should meet. They subscribed money for the expences of the society; he asked who would take the trouble of receiving and disbursing it? One said, I will do it, and keep the accounts for you; here commenced his power of appointing and removing stewards, for it was he, and not the people, who made the choice. The first preacher came to him, and desired to help him as a son in the gospel, and to labour when and where he should think proper to appoint; in this instance also, power was freely given him. The conference began by his inviting the ministers to advise with, not to govern him. The providence of God, he said, had cast this power upon him, without any design or choice of his own; and as he had accepted it in obedience to that providence, so in the same obedience did he continue to exert it.

Wesley's care of the preachers, it is said, extended even to the smallest things; the founder of a protestant sect could not indeed *prescribe* a diet for his followers as was done by the monastic worthies, but he could advise for their bodies as well as souls; egg and wine, and all spirituous liquors, he declared, were deadly poison, especially after preaching; at that time lemonade was

to be taken, candied orange peel, or a little soft warm ale. At one of the conferences he issued his advice, though with a premisal that advice is made for the few that will take it; touch no dram, tobacco, or snuff; eat very light, if any supper; breakfast on nettle or orange-peel tea; lie down before ten; rise before five; every day use as much exercise as you can bear; or, murder yourself by inches. Wesley imagined he had a gift for the medical art: George Fox had once the same fancy. It is the only point of similitude between two extraordinary men, in every other respect utterly unlike each other; between a worldly man, and one simple as a child; between a man of inordinate ambition, and one who was pure and lowly of heart; between a pharisaic institutor of forms and ceremonies, and an Israelite indeed, in whom there was no guile. A worse danger than the spread of methodism can scarcely be apprehended for England; a greater blessing for mankind cannot be desired or devised, than that the system of George Fox should become the practical system of the Christian world.

At all times Wesley had professed a sincere love for the church, and declared, that he would not separate from it; but the forms of respect were gradually thrown aside, as he felt himself stronger; already he had exercised episcopal power. At first he had allowed no service during the church hours; in 1786, it was permitted when the minister is a notoriously wicked man; when he preaches arian, or any equally pernicious doctrine; when there are no churches in the town, sufficient to contain half the people; and when there is no church at all within two or three miles. As the pernicious nature of the clergyman's doctrine was to be judged by the itinerant's single opinion, this was equivalent to a general permission. By way of salvo it was advised, that the preachers who officiated during church hours, should read the psalms and lessons, and part of the prayers, "because this will endear the church service to our brethren, who probably would be prejudiced against it, if they heard none but extemporary prayer!"

No alteration or event of importance in the society occurred from this time till 1791, when Wesley died at the age of 89. The number of preachers in Great Britain was at that time 291, and of

members 71,668. So far back as the year 1769, Wesley had issued directions how the connection should proceed, whenever that event should take place; "perhaps," he said, "you might take some such steps as these: On notice of my death, let all the preachers in England and Ireland repair to London within six weeks; let them seek God by solemn fasting and prayer; let them draw up articles of agreement, to be signed by those who chuse to act in concert; let those be dismissed, who do not chuse it, in the most friendly manner possible; let the remainder chuse by votes, a committee of three, five, or seven, each of whom is to be moderator in his turn; let the committee do what I do now."

It had been expected, that the death of Wesley would shake and dislocate the connection, but every thing went on as before. The conclave elected no new pope. Instead of having a perpetual president, the conference were now annually to elect one, and this was all the difference. The political fact is curious. The power of Wesley was actually monarchical or papal while he lived, and yet his death occasioned no more change or difficulty to the society, than would have been produced at Berne by the loss of the national bears. He had been regarded as the head of their body politic, but in fact was only the hat, crown, or tiara.

Under this republican hierarchy, the society has increased even more rapidly than at any former period. Some improvements and alterations have been made in the organization and discipline; the circuits have been formed into districts; each district containing from eight to three circuits, upon the average five.

"The districts have authority, 1. To try and *suspend* preachers who are found immoral, erroneous in doctrine, or deficient in abilities. 2. To decide concerning the building of chapels. 3. To examine the demands from the circuits respecting the support of the preachers, and of their families. 4. To elect a representative to attend and form a committee four days before the meeting of the conference, in order to prepare a draft of the stations for the ensuing year. Three things the district assemblies cannot do:— 1. They cannot *make* any rule. 2. They cannot *expel* a preacher. 3. They cannot *station* the preachers. An appeal to the conference is allowed in all cases."

They have separated somewhat more widely from the church. Wesley, hav-

ing been regularly ordained, used in his annual visits to administer the Lord's supper. The societies petitioned that they might still enjoy this privilege; on the other hand, many who, like Wesley, were for keeping up appearances with the church which they undermined, insisted that the privilege should not be granted. The conference being divided in opinion, decided it by lot for that year, and the lot was against the administration; it has since been permitted upon certain conditions, and is now administered in above two hundred of the societies. Gowns, cassocks, and bands, which Wesley wore, have been prohibited upon the plea of avoiding offence; the title of reverend forbidden to be used by them toward each other; and the distinction between ordained and unordained preachers dropt. These have been the chief alterations since the founder's death. The state of the connection in 1800 was as follows: 940 chapels in the united kingdoms; 417 preachers, and 109,961 members; so that in ten years, the addition to their force consists of 38,393. It must be remembered, that these are only the Arminian methodists, only one of the combined armies against the church of England. Let the church look to it! This is the History of the Rise and Progress of Methodism. Let the church look to it, or the sequel will be the History of her Decline and Fall.

The organization of this connection, as they denominate themselves, has been skilfully constructed: it is a system of compleat subordination; the members to the helpers; the helpers to the superintendants; the superintendants to the conference. The whole commonwealth is divided into districts; districts into circuits; circuits into societies; and societies into classes and bands. So watchful an eye is kept upon the subjects of this hierarchy, that no one can remove from one society to another, without a certificate from his superintendant, of which notice must be given to every society. Any member who shall yoke himself or herself to an unbeliever, is expelled; for as the Mohammedans express their scorn and hatred of the Christians by this contemptuous appellation, in like manner do these schismatics insult the members of the established church of their country. The preachers and superintendants act as booksellers for the conference, being charged to recommend frequently and earnestly the

books which they have published, as those which ought to be read in preference to any other. To read only the Bible, is declared to be rank enthusiasm; if you read only the Bible, say they, by parity of reason you ought to hear only the Bible, and if so, preaching becomes needless. During the life of the founder, no preacher was permitted to print or reprint any thing, till Wesley had corrected it. This inquisitorial office is now exercised by a book committee.—Whatever is thus published, with their authority, becomes the property of the conference, the author having, for his own emolument, a tenth of the impression; and it is worthy of remark, as it indicates the number of their impressions, that this is expressed by saying, he shall have a hundred copies out of every thousand. A preacher, who may exercise his Englishman's privilege of printing without this popish licence, is not permitted to sell his book at the chapels, nor to advertise it from the pulpits.—These are not the only advertisements which are issued from the pulpits. *God-fearing* servants, who want places, and *serious* house-keepers who want servants, advertise their wants in like manner by the preacher. The covers of their official magazines are filled with such notices. The plan of itinerancy was admirably devised to cement and consolidate the whole of the system. As no preacher is permitted to remain more than two years in a place, he has not time so to establish himself as to become independent of the conference; and as the members of this conference, or conclave, or convention, are all itinerants, the pleasures and advantages of power outbalance the inconveniences of this unsettled life. In another point of view, this plan is useful, as it renders the governors intimately acquainted with those whom they are to manage.

The funds of the connection are derived from the books, and from the yearly subscriptions. The profits of the books, for the year preceding the conference of 1802, was 1087l. 13s. and this was the smallest annual sum that they had produced since the death of Wesley. The whole receipts of that year amounted to 9079l. 4s. 2d. It was the original rule of the societies, that every member, unless he were too poor, should contribute one penny per week, and one shilling for the quarterly renewal of his class or band ticket. This probably is

ANN. REV. VOL. II.

to supply the funds of each particular society. The main revenue of the state, if that phrase may be applied to a parliament of priests, arises from the yearly subscriptions. All is said to fall short of the necessary expences. This deficiency, however, does not, and will not impede the growth of the connection, nor the increase of the preachers. The preachers are not actuated by the prospect of immediate and direct emolument; their self-interest is less gross than that of Henry Huntington, *S. S. sinner saved*, the quondam coal-heaver, who prays for new breeches; and when one of his congregation, in consequence, sends him a pair, prints and publishes the story, with the blasphemous observation, that it is no wonder they should fit, for his Master knows his measure, having miraculously clothed him for seven years.

Will it then be asked, by what hopes of advantage, can so great a company of preachers have been raised, and by what motives are so many induced to engage in so laborious a vocation? Undoubtedly they are, for the most part, sincere when they begin the work, to which indeed, at present, many of them are regularly trained in the Kingswood school, which is now appropriated for the children of the preachers. To this early zeal, it is not uncharitable to add, the love of popular applause, as an assistant, predominant and permanent motive, for by no other possible pursuit could they so certainly and so fully gratify this passion, how craving soever. Their celebrity, indeed, is confined within the limits of the connection, and is but a lifehold property; but the society is their sphere, their world; and what this fame may want in extent and duration, is amply made up by its intensity. Dear man! sweet man! fine man! blessed man! these are the aspirations that ascend from old women and young women to the orator's ears, while his male auditors groan, in undersong, and twirl their thumbs. At length his portrait appears in the Methodist Magazine, the official gazette which is to make honourable mention of his merits; thus is he installed among the worthies; thus does he take possession of his shrine in the pantheon; this is the consummation of his glory; this is his apotheosis, the canonization of the living saint. Nor is fame only his reward; a gift of prayer leads to more substantial benefits.—

P

Happy are they who can obtain the preacher for their guest, that they may enjoy his gift in private, and that he may bless the feast which they provide for him; to this may be added, without illiberality or scandal, the opportunities afforded him of marrying to advantage. When it is considered, that the men who are thus honoured, thus flattered, thus caressed and courted, would have been tradesmen of the lowest order, bakers, barbers and taylor, perhaps servants or labourers, if they had remained in that rank for which, by birth, education, knowledge and intellect, they are fitted, it will be seen, that the worldly inducements to become a methodist preacher are neither few nor trifling; and the ultimate object held in view by this ecclesiastical society must never be forgotten. — They profess an entire conformity in doctrinals with the church, and subscribe to her discipline. Whensoever, therefore, they shall have become the majority, whensoever they shall have succeeded in emptying the churches and cathedrals, they are ready to fill them; to take possession of the seats, stalls, and thrones; to translate society into parish; helper into priest; superintendant into bishop; circuit into diocese; conference into convocation; from which revolution God preserve the church of England! from which triumph of ignorance, craft and fanaticism, from which renewal of intolerance and persecution, God preserve the people of England!

Nor are the means which they pursue less mischievous than the end at which they aim. True it is, that they preach against vice and discourage it; the profession of morality is common to all sects and all religions, nor can religion be professed without it. The methodists may, perhaps, be as sober as the mahometans; so far they have produced some contingent good among the ruder ranks of society; for it is the wise order of things that some good should be educed from every thing; but with what evil is this accompanied? Let us examine their practice, its dissocializing character, its inevitable tendency to darken the understanding, and defile the imagination. Be serious, says the edict of the conference; avoid all lightness as you would avoid hell-fire; and trifling as you would cursing and swearing; fix the end of each conversation before you begin; watch and pray during the time; rarely spend above an hour at a time in

conversing with any one; if you stay above an hour at any place, take out a book and read; the children at Kingswood school must never play, and a master must be always present with them. In this precious seminary, the most mongrel medley of studies is pursued, that ever could be planned by ignorant fanaticism, and stupid bigotry. Methodism and mysticism are mingled with the classics, materials as heterogeneous as the ingredients of Ezekiel's cake; with Cæsar and Sallust, they are to study Bengel and Bunyan; Law's Christian Perfection; the Life of Mr. De Renty; and the Life of Mr. Haliburton. Homer, and Virgil, and Shakespeare, and Spenser, are to be read, and their effects worked off by plentiful doses of Thomas à Kempis, and John Wesley. "Whoever carefully goes through this course, say they, will be a better scholar than nine in ten of the graduates at Oxford or Cambridge." On Sunday they eat cold meat; a diet which, it will be remembered, certain methodist legislators once attempted to enforce upon the people of England by law; on Wednesdays and Fridays they are allowed no animal food, and on Fridays they fast, *if they chuse it*, till three in the afternoon, a practice which hath been found greatly conducive to health! Oh! if superstition is again to triumph and to reign, let us rather be harlot-tempted than hag-ridden; let her not come in dirty linen and dingy black, with sallow face and greasy locks, but in purple and in scarlet, decked in gold and precious stones and pearls! if we are to be made drunk with the cup of her abominations, instead of being drenched with the dregs of small beer from an ale-house mug, let us quaff wine from the golden goblet; if another twilight and night of human reason is to come upon us, let us build up our monasteries again, let us re-establish the benedictines and revive the jesuits, that there may be at least lights shining in the darkness.

Wear no needless ornaments, says the conference, such as rings, earrings, necklaces, laces or ruffles. The preachers are not to give band tickets to any who dress in the fashion, not even to married women, who may plead that they dress thus to please their husbands; sometimes the father of a family is their dupe, woe then to the children! the son shall be turned out of doors as unregenerate; and while the fattened calf is

killed for the preacher, they shall make the daughter of the house kneel, and insult her by praying for that unconverted and hardened sinner. More frequently the woman takes their bait; no sooner then is her husband gone from home, than the dear helper is apprised, that he may come and solace her in private with comfortable prayer. Pestilent insects! thus it is that they canker the fair flower of domestic peace; whatever they touch they fly-bomb, and leave it to ferment and fester.

An unbeliever, it must be remembered, signifies, in the methodist nomenclature, every person who is not a methodist. We shall copy a part of the minutes of the third conference, showing how they are to be dealt with, in order to conversion.

“Q. Can an unbeliever (whatever he be in other respects) challenge any thing of God's justice?—A. Absolutely nothing but hell; and this is a point which we cannot too much insist on.

“Q. Do we empty men of their own righteousness, as we did at first? do we sufficiently labour, when they begin to be convinced of sin, to take away all they lean upon? should we not then endeavour, with all our might, to overturn their false foundations?—A. This was at first one of our principal points, and it ought to be so still; for till all other foundations are overturned, they cannot build upon Christ.

“Q. Did we not then purposely throw them into convictions? into strong sorrow and fear? nay, did we not strive to make them inconsolable? refusing to be comforted.—A. We did, and so we should do still, for the stronger the conviction, the speedier is the deliverance; and none so soon receive the peace of God, as those who steadily refuse all other comfort.

“Q. Let us consider a particular case:—Was you, *Jonathon Reeves*, before you received the peace of God, convinced, that notwithstanding all you did, or could do, you was in a state of damnation?—*J. R.* I was convinced of it, as fully as that I am now alive.

“Q. Are you sure that conviction was from God?—*J. R.* I can have no doubt but it was.

“Q. What do you mean by a state of damnation?—*J. R.* A state, wherein if a man dies, he perisheth for ever.”

It would be needless to detail their mode of practice upon this plan; every person who has once entered their meeting-houses, must know how their sermons are seasoned with brimstone, and glowing with hell fire. So fright-

ful are the effects of such a conduct, that Spenser has assigned it to his Despair as the last and powerfulest temptation that even that fiend could devise.

—————“When the miscreant  
“Perceived him to waver, weak and fraile,  
“(Whiles trembling horror did his conscience daunt,  
“And hellish anguish did his soul assaile,)  
“To drive him to despair, and quite to  
“quaile,  
“He shew'd him, painted in a table plaine,  
“The damned ghosts that do in torments  
“waile,  
“And thousand seeds that doe them end-  
“less paine  
“With fire and brimstone, which for ever  
“shall remaine.”

What therefore was to be expected from such a system, has actually resulted. The increase of madness, in England, has been proportioned to the increase of methodism. This is not lightly hazarded, nor ignorantly affirmed. Positively and knowingly we assert, that the increase of madness, melancholy madness, religious madness, the worst form of the worst calamity which flesh is heir to, has been proportioned to, and occasioned by the growth of methodism. In Moorfields itinerant preaching began, and in Moorfields is its consummation; there the first seed was sown; and there the fruit may be seen,—Bedlam is the granary.

Such are the effects of their denunciations of damnation, and of that tremendous blasphemy, their yearly covenant with Almighty God! Thus it is, that they foster and force the seeds of insanity wherever they exist: minds predisposed to madness, being prone to methodism, as the dropsical sufferer craves for the draught which aggravates his disease. Upon those of a happier temperament, who escape its physical effects, it acts as a moral poison. Even in the first freshness, in the heat and vigour of their sanctification, they become liars and systematic hypocrites; they call themselves the vilest of sinners, and believe themselves the elect of God; they profess the utmost humility and self abasement, the deepest conviction of their own unworthiness and wretchedness; and they groan and lift up their eyes in contemptuous compassion for their kinsman and their neighbour, the master of the family, and the parish priest, their brother, and perhaps their

very parents, as for the rejected, the vessels of dishonour, the children of wrath, who are to lie howling, while they themselves shall be ministering angels. They humble themselves to each other that they may be exalted, baiting with self-accusation for flattery, each pampering the other's spiritual pride. For a while this miserable self-delusion continues in full force; every lucid interval is the devil's work; and the devil hath the credit of every thought akin to common sense. But when these intervals grow longer, and recur more frequent, when these thoughts or temptations, as they are called, come upon them thick and thronging, still they continue the same exterior, the same face of formality, the same lip-righteousness; the smoke is kept up, though the fire hath cooled; they have enlisted, and are ashamed to desert; they are fettered by habit, by vanity, by interest.

Their separation of the sexes is even more mischievous than all the impure precautions of popery. Touch no woman, says the conference; be as loving as you will, but the custom of the country is nothing to us. Every preacher is charged to see that the men and women sit apart in their chapels; they are also to meet men and women, the married and the single apart. In their bands, sex is separated from sex, husbands from batchelors, and maids from matrons. In these societies, each is to confess to all; *to confess*, in the strict and popish sense of the term, "to speak freely and plainly the faults they have committed in thought, word, or deed, and the temptations they have been exercised with since their last meeting." They are to be asked "as many and as searching questions as can be, concerning their sins and temptations. Have you been guilty of any known sin since our last meeting? What temptations have you met with? How were you delivered? What have you thought, said, or done, of which you doubt whether it be a sin or not?"

Englishmen, who have happily been delivered from the bondage of the Romish church, are well aware of the evils which inevitably result from auricular confession. Our fathers witnessed those evils, and bore testimony against them; they bore their testimony against them in danger and in suffering, in prison, in torments, in the flames; but the confession of the catholics is modest and innocent,

when compared with that which these schismatics have introduced. Of what nature it must chiefly be, is evident from this separation of man from woman, of maid from matron, in the bands, and when they are visited by the helper, the priest, the father confessor. We must touch lightly on this abominable subject. Is it possible, that they who devised this confession, could be ignorant of its consequences? Every incipient feeling, every lighter thought that would have past over the maiden's mind and been forgotten, is to be remarked and remembered, that it may be renewed, and rivetted and *burnt-in* to the heart by the pain and shame of confession! of confession, not to one whom, from his age and character, she has ever from her infancy been taught to regard with fatherly, or more than fatherly reverence, and who, by the holiest oaths, and the severest penalties, is bound to inviolable secrecy, but to companions of her own sex and age, who will make it their tea-table talk; and each of whom is, by a similar confession, to renew and scar her shame! Either from natural and sacred modesty, the thought will be concealed, and made more intense by the imagined sinfulness of that concealment; or it will be confessed, and that action will strengthen the idea, and the idea will recur more frequently, because it is thus strengthened; and thus confession will be again and again required, till a sinful pleasure be at length extracted from confession itself, the atonement will partake of the nature of the sin, and all modesty and all shame be utterly destroyed.

We have now detailed the History of Methodism, explained its organization, and exposed its tendency. Whoever reasons and understands the nature of the human mind, will perceive that it is a system which must necessarily darken the understanding, deaden the moral feeling, and defile the imagination; its ultimate object is to destroy the church establishment. No, say they, we would not destroy it, we are no enemies to the establishment! Neither was the Pretender an enemy to the throne of Great Britain, he had no design to destroy it, all that he meant was to eject the reigning prince, and seat himself in his stead.

*The church of England is in danger*; and her clergy will be ousted from their benefices, unless some effectual remedy be speedily applied. The Arminian me-

thodists of Great Britain, have increased above 38,000 in number, within ten years, according to their own population returns; and the Calvinistic branch is equally active, and probably equally numerous. Many of them have already entered the church, so many as to form a loud and powerful faction; and, it is said, that they have funds among them to strengthen their party, by purchasing presentations. Meantime the conduct of the church has been such, as leads to her own destruction; if she persish, it will be by suicide. Infidelity and atheism have been her bug-bears; she has been acting like an idiot, who cracks a flea in triumph, while he suffers a viper to crawl into his bosom. Infidels and atheists will always be the minority; their opinions will die with them untransmitted, and their children fall into the ordinary course of society. Nature will not suffer her instincts to be perverted; blindness of heart is no more hereditary than blindness of eye; these defects are forbidden to be perpetuated by the same unerring wisdom which renders mules and monsters incapable of propagation. Some miserable individual may occasionally raise his voice, but they never form a sect; and like stage players, every new blasphemer effaces the notoriety of his predecessor. They have no common object; their very speculations differ; and, if in any one point they are united, it is in preferring, to all others, that establishment under which they are secure of toleration. Infidelity and atheism are excellent man-targets to fire at from the pulpit; they are enemies of straw, whom their antagonists may place in what attitude they please, and beat them at pleasure; but our clergy are called upon to a more serious conflict. There are, in Great Britain, 110,000 *united methodists*, there are as many more *united calvi-*

*nists*; they differ concerning unconditional election and irresistible grace, but they agree in hostility to the establishment, and will not dispute upon the partition treaty till they have won the battle.

*The church of England is in danger!* Is she then to resort to coercive measures for defence? God forbid! better means are in her own power, better and more effectual than these, which are neither justifiable by policy, nor reason, nor religion. We are attached to the establishment; and the advice which we offer will prove the sincerity of our attachment, because it is salutary and unwelcome. The thirty-nine articles must either be enforced or abolished; it is an insult to the understanding, and the feelings of the people, that their articles should be calvinistic, and their clergy arminian. It is degrading and hurtful to the clergy, that they should subscribe one set of opinions, and preach another. It is upon this weak point that the schismatics bring their artillery to bear; it is this which excludes from the establishment, those who would be its best and most ardent defenders, from the very strength of feeling which occasions their exclusion. Away with the African and Genevan interpolations of Christianity; let us have the religion of Christ Jesus, and not of Calvin; let that which the scriptures have left indefinite, remain undefined! Open the doors of the church, that they who feel and love the gospel may enter in, that zeal may be opposed by zeal, ignorance by knowledge, enthusiasm by virtue. It is idle to object, that this would effectually change the establishment; the establishment must undergo a change, "if it do not reform itself from within, it will be reformed from without with a vengeance." There is yet time for it to make its choice between reformation and ruin.

ART. LXIV. *Vindiciæ Ecclesiæ Anglicanæ: in which some of the false Reasonings, incorrect Statements, and palpable Misrepresentations, in a Publication, entitled, "The True Churchman, ascertained by John Overton, A. B." are pointed out. By the Rev. CHARLES DAUBENY. 8vo. pp. 471.*

THE controversy which in this work is continued, has now, for some time, been before the public, who, with us, will probably conceive that all has been long since advanced that the subject deserves or requires. "Much more in-

deed," as Mr. Daubeny himself remarks concerning *one* part of it, "has been written than appears necessary to its perfect illustration. The real merits of it lie in a narrow compass, and, by a writer in the habit of annexing clear and

precise ideas to the words he uses, may be comprehended in a few sentences." P. 233. For ourselves, we confess, that we have long been fully persuaded, that however the articles of the church may appear to lean towards that moderate Calvinism which is professed by some in the present day, it is contrary both to historic fact and the clearest evidence, to attribute, to the compilers of them those sentiments which J. Calvin and his disciples taught. The slightest comparison between these articles, the liturgy, the homilies, the private works of our first reformers, Cranmer, Ridley, Latimer, and Hooper, and the institutes of Calvin, is sufficient to demonstrate the truth of this opinion: of this Mr. Overton himself seems to be convinced, as our readers will learn from the following passage, which at the same time will afford a specimen of the superiority which Mr. Daubeny has over his opponent:

"We are at length arrived at the conclusion of this chapter, professing to ascertain the true sense of our articles, and the genuine doctrines of our reformers; which Mr. O. winds up by telling his readers, that nothing is further from his purpose, 'than to infer, from what has been advanced in this section, that the precise theological system of J. Calvin in all its parts, and to its full extent, was intended to be established in the thirty-nine articles.' P. 93. The general object of Mr. O.'s publication, if I understand it, is to prove the articles of our church to be Calvinistic. This must be understood to mean, that they were constructed in conformity with the tenets of J. Calvin. In page 85 of this section, Mr. O. told his readers, 'that the large portion of the great body of the clergy of our church, who favoured Calvinistic sentiments, included the very men who thus formed and imposed these articles.' A few pages after (p. 91) Mr. O. writes thus: 'On all hands, therefore, does it thus unquestionably appear, how generally those (Calvinistic) sentiments were entertained by the founders of our church, which are now represented 'as a curious conceit,' 'a system of nonsense, &c.' The sentiments which in my writings were thus disgracefully characterized, related to the Calvinistic doctrine of absolute and unconditional decrees; which the learned Jortin described; as 'a religious system consisting of human creatures without liberty, doctrines without sense, faith without reason, and a God without mercy;' and which Dr. Balguy somewhere calls 'a system of nonsense,' because it endeavours, in contradiction to the most decided language, to reconcile the absolute decrees of the Deity with the ac-

countableness of a rational being. Such, then, according to Mr. O.'s own statement, were the 'sentiments entertained by the founders of our church;' for to such sentiments alone did the observations of Drs. Jortin and Balguy apply; and the persons, according to Mr. O., who entertained these sentiments relative to absolute and unconditional decrees, were the 'very men who framed and composed our articles.'

"From which premises Mr. O.'s readers may be led to conclude, on his authority, that the articles of our church were meant to be decidedly Calvinistic. But in the page now before us we are told by Mr. O. that 'the precise theological system of J. Calvin was not meant to be established in our articles.' This is such backward and forward writing, as renders the meaning of the writer to me incomprehensible. After having laboured through a whole chapter for the express purpose of proving that our reformers were decided Calvinists, and the articles framed by them of course Calvinistic; Mr. O. turns short on his readers, and tells them, by way of conclusion to this same chapter, that 'the precise system of J. Calvin was not intended to be established in the articles.' It would, therefore, I believe, be satisfactory to Mr. O.'s readers, and would certainly cut short the argument in this case, if Mr. O. would tell them, in plain unequivocal language, what system of doctrine was meant to be established in our articles; without perplexing them with describing that doctrine under a title in itself unscriptural, and to which he himself does not annex any precise and determinate idea. Instead of saying then, as Mr. O. does, that, 'our established forms do not teach directly several doctrines contained in Calvin's institutions,' p. 93; from which ambiguous mode of writing his readers may conclude, that our established forms teach those doctrines indirectly, and thus come prepared to swallow Calvinism in disguise; it would have been to better purpose to have said plainly, what doctrines our established forms directly do teach. His readers then might have known, under what doctrines of our church the tenets of Calvinism were supposed to be comprehended; and, if intelligent readers, have been qualified to judge of the strength of the ground, on which such a supposition stood."

Mr. Daubeny is engaged in the volume before us, not in vindicating the articles of the church from the charge of Calvinism, but his own work, entitled, "A Guide to the Church," from the rude attacks of Mr. Overton. To follow him through the long course of his argument, would needlessly occupy our pages, and be a wearisome and unprofitable task to ourselves and our readers. He has, in general, gained his purpose,

and disproved the positions of Mr. O., both as they respect the confessions of the established church, and the doctrine advanced in "the Guide."

In perusing this work, such enquiries as the following repeatedly suggested themselves to our minds:—If the sense of these articles, framed for the express purpose of preserving uniformity of opinion, be so obscure as this controversy represents it: if they, who are teachers in Israel, are thus divided in their opinion upon the doctrines to which they have respectively subscribed their assent as the doctrines declared by the church to be those of scripture, what good purpose do these articles answer? If after subscribing them, every one is at liberty to decide for himself respecting

the sense they bear, will not diversity of sentiment be likely to prevail as much as it could do, were the scriptures themselves proposed as the only formulary to which assent should be required? Are those articles of faith worth retaining, which demand such elaborate works of explanation, and now stand in need of some authoritative declaration to determine the sense in which they ought to be understood? Many of our readers also may have felt the same or similar difficulties upon this subject. If they wish for a satisfactory solution of them, we cannot recommend any other means more effectual than a diligent perusal of the Confessional, and the letters published upon the subject of subscription by the late Dr. Jebb.

ART. LXV. *A Charge delivered to the Clergy of the Diocese of Lincoln, at the Triennial Visitation of that Diocese in May and June 1803. By GEORGE PRETYMAN, D.D. F.R.S. Lord Bishop of Lincoln.* 4to. pp. 26.

THE subject of this charge is similar to that of the preceding work. His Lordship first attempts to prove that Calvinism is not agreeable to scripture, and then that the church of England is not Calvinistic. We shall select what the right reverend author observes concerning the homilies:

"But the most extraordinary circumstance of a negative kind remains to be noticed with respect to the homilies; to which so confident an appeal has lately been made by certain writers, that I request your particular attention to the fact I am going to state. Not one of the peculiar doctrines of Calvinism is mentioned in either of the two books of homilies. The word predestination does not occur from the beginning to the end of the homilies. The word election occurs only once, and then it is not used in the Calvinistic sense. The word reprobation does not occur at all. Nothing is said of Absolute Decrees, Partial Redemption, Perseverance, or Irresistible Grace. You all know that the former of these books was published in the reign of Edward the Sixth, and the latter in the beginning of queen Elizabeth's reign, and that both are pronounced by our thirty-fifth article to "contain a godly and wholesome doctrine, and necessary for these times;" that is, for the times in which they were published. If our great reformers, the authors of these homilies, Cranmer, Ridley, Latimer, and Jewell, had themselves, as is sometimes pretended, held Calvinistic opinions, is it to be believed that they would have composed a set of sermons, to be used by the parochial clergy in their respective churches, for the avowed

purpose of establishing their congregations in a sound faith and a right practice, without even mentioning in them any one of these points? And let it be remembered, that the subjects of many of the homilies are immediately connected with the Calvinistic system, such as Original Sin, the Salvation of Mankind, Faith, Good Works, declining from God, the Nativity, the Passion, the Resurrection, the Descent of the Holy Ghost, the Grace of God, and Repentance.

"But though the homilies contain neither any discussion in support of the Calvinistic doctrines, nor any direct refutation of them, there is a great number of incidental passages which plainly shew that the authors were not Calvinists. The little notice taken of these points proves, that when the homilies were written and published, Calvinistic opinions had made very little progress in England. For, if they had been generally prevalent, or even if they had been embraced by any considerable number of persons, the framers of the homilies would have thought it 'necessary for the times' to have entered more fully into these subjects, and to have offered a confutation of what they manifestly considered as erroneous doctrines: they would have exposed the new errors of Calvinism in the same manner as they have exposed the old errors of popery. The fact is, that the introduction of Calvinism, or rather, its prevalence in any considerable degree, was subsequent to the beginning of queen Elizabeth's reign, when all our public formularies, our articles, our liturgy, and our homilies, were settled as they now are, with the exception of a few alterations and additions to the liturgy, not in the least affecting its general spirit and

character. Our reformers followed no human authority—they had recourse to the scriptures themselves as their sole guide. And the consequence has been what might have been expected, that our articles and liturgy do not exactly correspond with the sentiments of any of the eminent reformers upon the

continent, or with the creeds of any of the protestant churches which are there established. Our church is not Lutheran—it is not Calvinistic—it is not Arminian—It is Scriptural. It is built upon the apostles and prophets, Jesus Christ himself being the chief corner stone."

**ART. LXVI.** *A Dissertation on the Seventeenth Article of the Church of England: wherein the Sentiments of the Compilers, and other contemporary Reformers, on the subject of the Divine Decrees, are fully deduced from their own Writings. To which is subjoined, a short Tract, ascertaining the Reign and Time in which the Royal Declaration before the Thirty-Nine Articles was first published. By the Rev. T. WINCHESTER, D. D. late Rector of Appleton. A New Edition, with Emendations from the Author's corrected Copy, and the Addition of a Biographical Preface. 8vo. pp. 106.*

THIS little tract is reprinted as part of a larger miscellaneous work, entitled, "The Churchman's Remembrancer: being a collection of scarce and valuable treatises in defence of the truly primitive doctrines and discipline of the established church." The editors profess themselves "happy to introduce to the public Dr. Winchester's admirable treatise on the seventeenth article: a work now known to very few, and not procurable for money; the design of which is to prove, that our reformers were not Calvinists, by the same mode of argument as that by which Dr. Kipling has, very recently, demonstrated that our liturgy and articles are not Calvinistic: and such is its execution, that, excepting those "predestined never to be convinced," it will doubtless be considered by all its readers "as decisive" upon the point in question, "and as setting it at rest for ever." P. v.

In prosecuting his enquiry, Dr. Winchester very wisely confined himself to the sense of our reformers in the reign of Edward VI.

"The design of the ensuing dissertation is, to prove that the seventeenth article of the church of England, which treats of predestination, was not drawn up by the compilers of our articles, conformable to the doctrine of Calvin on this subject. In prosecuting this enquiry, it is intended to confine it to the sense of our reformers in the reign of Edward VI. To proceed further, into that of Elizabeth, would only be to discover that many of our divines, during their exile under Queen Mary, were strongly tinctured with Calvin's doctrines; which occasioned at length great disputes at Cambridge in the year 1595.

They who maintain that the article is calvinistical, have generally chosen to fix upon this \* latter period; but the evidence drawn from those times, whatever it may amount to, cannot be equal to that which arises from the apparent sentiments and design of the compilers themselves, and their contemporaries."

He first states at large Calvin's opinion on the subject of the xviiith article: then, from the design and history of the article, and the sentiments of the principal compiler of it, (Cranmer) he shews, that it gives no countenance to the doctrines of the Genevan reformer. To confirm this, he next produces, from the *Reformatio Legum*, the chapter de *Prædestinatione*. The testimonies of Bishops Hooper and Latimer, against the rigid doctrine of the Calvinists, are then produced, and are strong in favour of the anti-calvinistic interpretation; lastly, the difference in opinion, on this subject, between those who were imprisoned by Queen Mary, is considered.

A passage from Latimer is very remarkable: "Christ shed as much blood for Judas as he did for Peter; Peter believed it, and therefore he was saved; Judas would not believe it, and therefore he was condemned, the fault being in him only, and in nobody else." This is certainly not calvinism; and Mr. Overton, in attempting to get rid of the difficulty it occasions, has resorted to the strange and useless measure, of proving the sentiment not just.

The declaration prefixed to the articles is, in the short tract subjoined, proved to have been published in the reign of Charles the First.

\* Dr. Waterland, in the Supplement to the Case of Arian Subscription, has considered, in a masterly way, the disputes on this subject, which happened in the reigns of Elizabeth, James I. and Charles I.

ART. LXVII. *A Reply to the Anguis in Herba of the Rev. James Hook, M. A. & F. S. A. containing a Refutation of his Defence of Pluralities, Non-residence, and the Employment of Substitutes by the Beneficed Clergy. By A MEMBER OF THE ESTABLISHED CHURCH. 8vo. pp. 87.*

THIS is a strenuous and well written defence, of a very important work noticed in our last volume, and entitled "the Necessity of the Abolition of Pluralities, Non-residence, &c." against which the Rev. James Hook, *credens se aliquem*, had entered the lists, and taken up the gauntlet in favour of his pluralist and non-resident brethren. We suspect that the author of that work is here again before us; if not, he is one who, by many strong marks of likeness, discovers a near affinity. It is not necessary to enter into a detail of this transaction, it contains little that is not to be found in the larger work to which we have just alluded.

The following passage deserves the attention of Mr. Hook, who has argued in support of pluralities, from the small income arising from the greater part of livings:

"It is singular, that this gentleman takes no notice of the number of superior benefices, which form a competent maintenance for a resident incumbent; and one might suppose, that in his opinion there were no single livings sufficient for that purpose. I am convinced however, from my own observation, and the information of others, that the number of benefices in England, above 300l. a year, cannot be less than 2000, and these best livings are held in plurality equally with the inferior! Is a plurality of these to be defended on the plea of poverty? Or rather, is not the insufficiency of some churches made use of as a pretext to hide and support the plurality of others that are sufficient? If the plan of universal residence cannot be reduced to practice, as near an approximation to it as possible should be adopted; and a law should be passed to prevent benefices above 300l. or 400l. per annum, to be held in plurality by any clergyman."

It is indeed high time that some reformation should be adopted, if the esta-

blishment is to possess the esteem of the great body of the people; who not being liable to be misled by interest, feel the force of such truths as these:

"Every one admitted into the christian ministry is equally bound, by the express authority of scripture, to employ his time and exert his talents in the faithful and conscientious discharge of its duties, and to make full proof of his ministry. The clergy being under an indispensable obligation to perform it in their own persons, it becomes, by necessary consequence, impossible that they can neglect it, or discharge it by the agency of a delegate. Every character, title, and designation, attributed in the gospel to its ministers, demonstrate this truth. An ambassador is not at liberty to delegate the commission which he has received from his sovereign to a substitute of his own appointment. A watchman or sentinel is not allowed to neglect or desert his post, or place another in his stead at his own pleasure. A shepherd is not permitted to forsake the flock entrusted to him, and commit them to the care of a hireling. A steward is not suffered to absent himself from the family of his lord, and assign the care and management of his household to a deputy. And therefore those, who are commissioned to go and preach the gospel, are not at liberty to refuse to go and discharge their important mission, or to send others in their room; much less, if they neglect to serve at the altar, ought they to live by the altar. Every clergyman must give an account of his personal diligence and fidelity in the work of his Lord, and receive his reward according to his own work, and not according to the labour of his substitute."

"On these equitable principles were the ministers of the gospel first established, and by these just principles did they regulate their conduct for ages; nor is a single instance to be found in the history of the church, for near a thousand years, of any minister, in any order and rank of the priesthood, performing his duty by the help of a substitute, much less of any minister receiving the rewards earned by the services of his deputy."

ART. LXVIII. *A Word of Advice to all Church Reformation-mongers: containing Strictures on two recent Publications. 8vo. pp. 32.*

THE two recent publications are—"the Necessity of the Abolition of Pluralities, &c." and "a Plea for Religion and the Sacred Writings," both noticed in our former volume. This Word of Advice is, not inaptly, styled by the author

a squib; and as we have no fondness for gun-powder, we shall not venture to touch it. Our readers, we can assure them, will suffer no loss; and they will keep themselves out of danger, if they follow our example.

**LXIX.** *An Appeal to the Right Reverend the Archbishops and Bishops of the Church of England.* 8vo. pp. 16.

A POMPOUS and angry declamation against those upon whom anger and rebuke are wasted, the Editors of the *Anti-Jacobin Review*, who, it appears, "have recommended their co-adjutors and friends to a place on the august and venerable bench" of bishops. Not producing the numerous instances they have afforded of corrupt criticism, lax morality, and unsound theology, nor expatiating upon the abuse they have poured upon the administration of their country, and upon many of the ministers of

religion, the author grounds his charge against them, upon a favourable review, which they have published of a work, in which it is proposed, that subscription to the articles of the church of England shall be abolished; and in one paragraph of which, the whole body of the English clergy is involved in deep and indiscriminate censure! We cannot think that there is any reason to apprehend, that the recommendation of such persons can have any influence upon the minds of our spiritual rulers.

**LXX.** *A general Epistle of Brotherly Admonition and Counsel, to the People called Quakers, in Great Britain, Ireland and America, issued at the Time of the Yearly Meeting in London, Anno 1803; on behalf of sundry Brethren concerned for the religious Improvement of that Society.* By THEOPHILUS FREEMAN. 8vo. pp. 24.

IN a full belief of that divine call and assistance which formerly attended many of his predecessors, the author wishes to excite the society of friends to the recollection of past examples, and to engage their attention to the genuine concerns of the christian religion, p. 4. Generally speaking, Mr. Freeman considers the forefathers of the present quakers, as believers in the simple unity of God, and the divine mission of the Great Prophet of Nazareth. In this respect, he recommends an imitation of their example, but he regards them as mistaken upon the subject of tythes; and wishes every opposition, in itself, not consistent with the laws of the land, to

be laid aside. He objects to the doctrine of eternal torments; to the predominant feeble ministry of females; and recommends a greater degree of attention to the classical and religious education of their young men. He also censures many parts of the present discipline, as hastening the decay, rather than administering to the support of a society, which he seems to consider as in a state of declension.

This little tract will be read with pleasure, by those who feel any interest in observing the progress of religious enquiry, and the revolutions in religious opinion.

## CHAPTER III.

## HISTORY, POLITICS,

AND

## S T A T I S T I C S.

THE publications of the last year that come under the department of civil history and politics, though equal in numbers, are, upon the whole, inferior in importance to those recorded in our former volume. The anti-revolutionary war which was terminated by the peace of Amiens, has found a historian in Mr. Steevens, whose ponderous volumes are principally, however, taken up with the exploits of the British, the documents of which were at hand, than with those of our continental confederates, which would have required the previous collation and study of French and German authorities. The last years of this eventful contest, commencing from the interrupted negotiations at Rastadt, have also been related by Mr. Ritchie, but without communicating to us much novel information.

Dr. Bisset has executed an ample, accurate, and instructive account of the reign of George the Third, highly flattering to a Sovereign of whose personal opinions it is perhaps too much the mirror. Mr. Coote has continued his History of England to the peace of Amiens, in the concise form and liberal spirit of his former volumes. The late Professor Millar's History of the English Government is a work of no common value, though rather to be numbered among the theories of philosophy than the records of experience.

The History of Ireland, especially since the accession of the house of Stuart, has been detailed by Mr. Plowden with voluminous generosity. He exhibits the English government as a penitent in a confessional, and, by the allowed dedication of his work to the Prince of Wales, may be considered as the harbinger and pledge of a more just and honourable sway. Mr. Hay has communicated in a manner no less candid than interesting, the ineffacable horrors and disgraceful excesses of the promoters and quellers of the Wexford insurrection.

Mr. Adolphus has compiled a meritorious history of France: we are indebted to the Chevalier Tinseau for an English version of the late statistical survey of the French empire and her dependent provinces; and Miss Williams has cast an additional interest round the character of Louis XVI, by the publication of his confidential letters.

Towards relating the local fortunes of the West Indies, Mr. Dallas has contributed his History of the Maroon War, and Mr. Chalmers his Narrative of Transactions in San Domingo.

Mr. Card has presented the English public with a convenient and condensed Abridgement of the Annals of the Russian Empire; and Mr. Turner has brought down his History of the Anglo-Saxons to the forcible intrusion of the Norman dynasty.

The political tracts of the last year are almost wholly occupied with one great object; the recommencement of hostilities between Britain and France. Party distinctions have for the most part been laid aside, and the threat of an exterminating invasion has aroused the ancient patriotism of the British nation. The system of colonial policy has been investigated by Mr. Brougham with much ability: and the Essay on Population by Mr. Malthus, has been expanded from a small octavo to a large quarto, with a corresponding increase of publicity and general approbation.

ART. I. *The History of the Anglo-Saxons, from the Death of Alfred the Great to the Norman Conquest.* By SH. TURNER, F. A. S. Vol. III. 8vo. pp. 420.

THIS third volume of the Anglo-Saxon history is better executed than the second, is far better executed than the first volume: Mr. Turner here displays a research more travelled, and an estimate more judicious. The sagas edited in Denmark, and the manuscripts of the Cotton Library at length begin to be called in to his assistance: and considerable additions are made to the information so eloquently condensed by Milton; and so clearly unfolded by Rapin. Several manuscripts, however, which the Cotton Library contains, and which might have been expected to throw light on the events discussed, are not quoted. Such as the manuscript *Caligula, A. IX.*, in which illustrations may be found of the fabulous history of Arthur, and of his pretended invasion of Denmark. The Anglo-Saxon heroic poem, or chronicle in verse, of the tenth century, *Vitellius, A. XV.*, contains matter applicable to the purposes of this historian. There is a compendium of the history of the Anglo-Saxon kings, in *Domitianus, A. VIII.*, and also valuable particulars of the institutes of Knute, or Canute. Of this king again there is especial notice in the manuscript *Caligula, A. X.* and of his tribute, or tax, called *Danelage*, in the Harleian manuscripts, No. 746. There are also manuscripts concerning the gests of the Normans, whence perhaps something could have been borrowed to illustrate their origin, which is somewhat within our author's scope. Is not the Latin original also extant, whence Lydgate versified his life of St. Edmund? Yet we have not observed under that reign mention of either biography. When Mr. Turner has properly examined these, and some other domestic and foreign sources of instruction, he will, no doubt, revise his whole work, and accompany it with a profuse appendix of scarce and inedited

documents: it will become, we doubt not, a perennial monument in the temple of British literature. A greater detail, both of narrative and quotation, both of text and note, might with advantage have been indulged, and there are several of our country historians, who might be assessed for tributary materials. There is a fragment of an ancient poem concerning Saint George, which was edited at Copenhagen by Barthold Christian Sandvig in 1783, and which is transcribed from a Vatican manuscript containing the gospels according to Otfrid's version. From this ballad, or hymn, it appears that the Saint George, so highly venerated by the Gothic and Anglo-Saxon tribes, was an early christian missionary, and probably a Lombard by birth, for his legend has been found connected with a history of Lombardy. He was opposed by a heathen named Tatian, and cast into a well; but he rose again and wrought many miracles. It is not unlikely that this Saint George visited England, and left behind him that popularity of character, which we have since transferred to the army-contractor of Alexandria, the Cappadocian George. In this ballad he is called *mare crabo*, *merry count George*, which agrees with the chivalrous character ascribed to this Saint. We should have been glad to see the date of a mission ascertained, which has left such profound traces of efficacy in our vernacular literature. He can hardly have flourished before Beda (all whose works demanded the perusal of a historian of the Anglo-Saxons), as Beda would not have failed to notice him in the ecclesiastical history. Mr. Gibbon recommended a magnificent edition of the early writers on English affairs, and wished it to be entrusted to Mr. Pinkerton: Might it not be undertaken by a voluntary committee of the learned in

our antiquities, and the requisite expence defrayed by subscription? Mr. Turner could give to it, and derive from it, valuable assistance.

On no period of the Anglo-Saxon history has Mr. Turner thrown so much new light as on the reigns of Ethelred, of Edmund Ironside, and of Canute. We shall extract a part of the narration of this period.

“An important struggle ensued between Edmund and Canute for the possession of London. It was long besieged in vain, sometimes by a part of Canute's forces, sometimes by all. London was at this time defended on the south, by a wall which extended along the river. The ships of Canute, from Greenwich, proceeded to London. The Danes built a strong military work on the south bank of the river, and drew up their ships on the west of the bridge, so as to cut off all access to the city. Edmund vigorously defended it awhile in person, and when his presence was required elsewhere, the brave citizens made it impregnable.

“During the siege, Edmund fought two battles in the country: one at Pen in Dorsetshire; the other, the most celebrated, at Seearstan, about Midsummer.

“Edmund selected the bravest soldiers for his first line of attack, and placed the rest as auxiliary bodies; then noticing many of them individually, he appealed to their patriotism and their courage, with that fire of eloquence which rouses man to mighty deeds. He conjured them to remember their country, their beloved families, and paternal habitations: for all these they were to fight; for all these they would conquer. To rescue or to surrender these dear objects of their attachments would be the alternative of that day's struggle. His representations warmed. A country overrun, the massacres of ferocious victory, and plunder every where triumphant, were anticipations which excited the Anglo-Saxons to every martial daring. In the height of their enthusiasm he bade the trumpets to sound, and the charge of battle to begin. Eagerly his brave countrymen rushed against their invaders, and were nobly led by their heroic king. He quitted his royal station to mingle in the first ranks of the fight; and yet while his sword strewed the plain with slaughter, his vigorous mind watched eagerly every movement of the field. He struggled to blend the duty of commander and the gallant bearing of a soldier. Edric the Infamous, and two other generals, with the men of Wilts and Somerset, aided Canute. On Monday, the first day of the conflict, both armies fought with unprevailing courage, and mutual fatigue compelled them to separate.

“In the morning the awful struggle was renewed. In the midst of the conflict Edmund forced his way to Canute, and struck

at him vehemently with his sword. The shield of the Dane saved him from the blow, but it was given with such strength that it divided the shield, and cut the neck of the horse below it. A crowd of Danes then rushed upon Edmund, and after he had slain many he was obliged to retire. Canute was but slightly wounded.

“While the king was thus engaged, Edric the Infamous struck off the head of one Osmear, whose countenance resembled the king's, and raising it on high, exclaimed to the Anglo-Saxons that they fought to no purpose. ‘Fly, ye men of Dorset and Devon! Fly, and save yourselves. Here is your Edmund's head.’

“The astonished English gazed in terror. The king was not then visible, for he was piercing the Danish centre. Edric was believed, and panic began to spread its withering poison through every rank. At this juncture Edmund appeared receding before the pressure of the Danes, who had rescued Canute. He saw the malice, and sent his spear as his avenger. Edric shunned the point, and it pierced two men near him.

“But his presence was now unavailing. In vain he threw off his helmet, and gaining an eminence exposed his disarmed head to undeceive his warriors. The fatal spirit had gone forth, and before its alarms could be counteracted, the army was in flight. All the bravery and skill of Edmund could only sustain the combat till night interposed.

“The difficulty of the battle disinclined Canute from renewing it. He left the contested field at midnight, and marched afterwards to London to his shipping. The morn revealed his retreat to Edmund. The perfidious Edric, discerning the abilities of the king, made use of his relationship and early connection (he had married Edmund's sister, and had been his foster father) to obtain a reconciliation. In an ill-omened hour Edmund consented to receive him on his oath of fidelity.

“Edmund followed Canute to London, and raised the siege of the city. A conflict soon followed between the rivals at Brentford. Both parties claim the victory. As Canute immediately afterwards beleaguered London again, the laurel seems to have been obtained by him. Baffled by the defence, he avenged himself on Mercia, whose towns, as usual, were committed to the flames, and he withdrew up the Medway. Edmund again urged the patriotic battle at Otford in Kent, and drove him to Shepey. A vigorous pursuit might have destroyed all Canute's hopes; but the perfidious counsels of Edric preserved the defeated invader.

“When Edmund withdrew to Wessex, Canute passed into Essex, and thence advancing, plundered Mercia without mercy. Edmund, earnest for a decisive effort, again assembled all the strength of England, and pursued the Dane, who was retiring to his ships with his plunder. At Assandun, in

the north part of Essex, the armies met. Edmund arranged his countrymen into three divisions, and riding round every rank, he roused them by his impressive exhortations to remember their own valour and their former victories. He intreated them to protect the kingdom from Danish avarice, and to punish, by a new defeat, the enemies they had already conquered. Canute brought his troops gradually into the field. Edmund made a general and impetuous attack. His vigour and skill again brought victory to his arms. The star of Canute was clouded, when Edric, his secret ally, deserting Edmund in the very hour of success, fled from the field with the men of Radnor, and all the battalions he commanded. The charge of Canute on the exposed and inferior Anglo-Saxons was then decisive. The valour of Edmund was forgotten. Flight and destruction overspread the plain. A few, jealous of their glory, and anxious to give a rallying point to the rest, fought desperately amid surrounding enemies, and were all cut off but one man. In this dismal conflict almost all the valued nobility of England perished. Ulsketyl, the noble duke, who had alone taught Svein the force of English valour, was among the victims of Edric's treachery.

"The betrayed Edmund disdained the death of despair, and attempted new efforts to rescue his afflicted country. He retired to Gloucester; and such was his activity and eloquence, that a fresh army was around him before Canute overtook him.

"It was then that the greatness of Edmund's soul appeared. He could not endure that the blood of his best subjects should be so lavished for his personal profit, and he challenged Canute to decide their quarrel of ambition by a single combat. He intimated the glory which the conqueror would gain, whose dignity would be the purchase of his own peril and merit.

"Canute accepted the proposal. The isle of Olney was the place of meeting, around which the two armies assembled. The kings received each other's spears upon their shields. Their swords were brandished, and the combat became close. Long the weapons sounded upon their helms and armour. Their dexterity was equal; their spirits emulous. At last the strength of Canute began to fail before the impetuosity of Edmund. He felt his powers fast ebbing, and in an interval of the combat, he exclaimed to the Anglo-Saxon, "Bravest of youths, why should our ambition covet each other's life! Let us be brothers, and share the kingdom for which we contend." Edmund, with generous prudence, agreed to the new idea; the duel ceased, and England was divided between them. Canute was to reign in the north, and Edmund in the south. The rival princes exchanged arms and garments; the money for the fleet was agreed upon, and the armies separated.

"The brave Edmund did not long sur-

vive the pacification. He perished the same year. The circumstances attending his assassination are variously given. Malmsbury mentions that two of his chamberlains were seduced by Edric to wound him at a most private moment with an iron hook, but he states this to be only rumour. The king's violent death, and its author, are less reservedly avowed by others. The *Knytlinga Saga* and *Saxo* carry up the crime as high as Canute. They expressly state that Edric was corrupted by Canute to assassinate Edmund."

We take the more pleasure in promulgating this interesting fragment, as it forms one of the best fables for a national epic poem, which our heroic ages present. The frank, the daring, the generous virtues of Edmund Ironside; the nationality and importance of his cause, fit him for a favourite hero. The triumph of Canute, by treachery and assassination, is a melancholy but not an useless lesson. In proportion as an age is barbarous, and as the moral taste is imperfectly evolved, the probability of success by foul means is increased. No bitterer satire can be written on a people than that its men of guilt were its men of sway. Public opinion can withdraw its countenance from the mightiest; and if resolutely bent on the success of virtue, principle, duty, justice, humanity and generosity, can baffle the force of armies, and the more dangerous seductions of opulent bribery. The true secret of the surprising influence of the Danish party in England, must be sought in the prevalence of heathenism. The Anglo-Saxon kings associated their cause with that of a church, which the overbearing insolence of a Dunstan had deservedly rendered odious. The Danish intruders were favoured by the unconverted portion of the nobles and of the people. The barbarous divinities of the *Edda* fought for the adherents of Canute; and the saints of christianity for the loyal followers of Edmund Ironside.

Mr. Turner may find warmer panegyrists of his exertions, but not sincerer valuers of his labours than ourselves. They have added much, they may add yet more to our knowledge of a period of British history, which displayed the heroic virtues and vices, and founded that taste for maritime enterprise so conspicuous in every subsequent age, and so conducive to our present prosperity. We recommend that, in a future edition, a distinct chapter, or book, be allotted

to the history of Anglo-Saxon literature. Every writer in that dialect should be enumerated, the biographical notices concerning him collected, the works, whether printed or manuscript, appreciated, and their lurking places indi-

cated. To the religion, the legislation, the manners and sports even, distinct disquisitions should be appropriated. It becomes us to light up many a taper before the shrines of our forefathers.

ART. II. *A Vindication of the Celts from ancient Authorities: with Observations on Mr. Pinkerton's Hypothesis concerning the Origin of the European Nations, in his Modern Geography, and Dissertation on the Scythians or Goths.* 8vo. pp. 180.

THIS author begins by stating, that he considers it as a duty to combat the system of Mr. Pinkerton, because its principles reject the authority of the holy scriptures. This is announcing beforehand that we are not to expect truth; but the perversion of testimony to the support of preconceived opinions. What have Mr. Pinkerton's antiquarian notions to do with the authority of scripture; or his religious opinions with the probability of his antiquarian system? This author, who writes in the plural number, as if he spoke the sentiments of a bench of bishops, says:

"We shall confine ourselves to a few grand points, which form the fundamental parts of his system.

"1. His chronology; 2. The boundaries and extent of ancient Scythia, and the identity between the Scythians and Goths; 3. Whether the Celts were confined to the furthest west of Gaul 500 years A. C.; 4. The early progress of the Goths in Europe; particularly in Thrace, Greece, Italy, and Gaul; 5. Their settlements in Germany, or an examination of the proofs that the ancient Germans were Scythæ, and that the Belgæ of Gaul were Germans; 6. The progress of the Goths, or Picts, in Scandinavia."

On the first topic the author thus continues:

"He begins his chronology with the fables of Egyptian history, and lays it down as a certainty, that Menes, king of Egypt, reigned about 4000 years before Christ, or nearly coeval with our æra of the creation.

"He then establishes a vast Scythian empire in Asia, extending from Egypt to the Ganges, and from the Caspian to the Persian gulf and Indian sea, 3660 years before Christ, or only 344 years after the creation. Of this empire, not the smallest mention is made by Herodotus, or any of the early writers; but it is barely hinted at in two passages of Justin (one of which is obscure and vitiated), in his abridgement of the History of Troglus Pompeius, who lived in the time of Augustus.

"In one of these passages, Justin, after speaking of Ninus, king of the Assyrians, says, 'that he first made war against the neighbouring people, who were incapable of

resistance, and subdued them as far as the confines of Libya. But in more ancient times lived Vexoris, king of Egypt, and Tanaus, king of Scythia; the first of whom made irruptions as far as Pontus, and the other into Egypt; but they waged distant wars, and not near their own frontiers, were content with victory, and abstained from empire. Ninus confirmed the magnitude of his power by permanent possession. Having conquered the neighbouring people, he passed to others with this accession of force; each conquest became the instrument of a subsequent conquest, and he thus subjugated the whole east. The last war was with Zoroaster, king of the Bactriani, who is first said to have invented magic arts, to have discovered the origin of the world, and the motions of the stars. Zoroaster being killed, Ninus also died, leaving his infant son Ninas, and his wife Semiramis, &c.

"In the second book, Justin, after describing the origin and conquests of the Scythæ, adds, 'After continuing fifteen years for the purpose of pacifying Asia, they returned at the solicitation of their wives, who declared, that unless they returned, they would obtain progeny from their neighbours, and would not suffer the Scythian name to be extinct. To these people, therefore, Asia was tributary 1500 years. Ninus, king of Assyria, put an end to the tribute.' Without the least hesitation in regard to the authenticity of this last passage, which is proved to be corrupted, Mr. P. computes the origin of the Scythian empire 1500 years before Ninus, believes the history of Ninus to be authentic, and fixes the æra of his reign about 2160 years before Christ, whereas the history of Ninus is generally reported to be fabulous, or is placed at a much later period.

"Mr. Pinkerton attempts to support this slight testimony by the authority of Eusebius, Epiphanius, and the Chronicon Paschale, who all say nothing on the existence of this great and early Scythian empire. Two of these writers, according to Mr. Pinkerton himself, only divide religious errors into four periods, Barbarism before the flood; after the flood Scythism, Hellenism, and Judaism; Epiphanius attributes the building of the tower of Babel, among others, to the Scythians, and Eusebius puts the Scythians as the immediate descendants of Noah, down to Serug, his fourth descendant, a period of 400 years.

“ Thus Mr. Pinkerton is compelled to acknowledge the event of the deluge in support of his system, though he had before denied it: and after all, his system rests on the vague authority of Justin, who lived at least 3800 years after the event, according to Mr. P.’s own chronology, even supposing that there was no proof of the passage being corrupted.”

Feeble as this argumentation may appear, it is a very sufficient refutation of Mr. Pinkerton’s wild and baseless hypothesis, of a primæval Scythic empire. The oldest historians are the best authorities for the oldest events; and they know nothing of this Scythic empire. These oldest historians are the Jewish writers, and Herodotus; by a diligent and critical comparison of whom, all that can be known of very ancient history must be inferred. Certain theologians have rendered it probable, that the Pentateuch was reduced to its present form in the family of Hilkiah, and was probably completed by Jeremiah at the time of his return to Jerusalem, under Cyrus, with the new name or title of Sheshbazzar. The accounts of the creation, of the deluge, and of the building of the tower of Babel, appear to be Babylonian documents, first obtained during the captivity. But the history of Abraham seems to be an original account, cotemporary with that patriarch, which had been preserved by his descendants in the land of Goshen, and brought from Egypt by Moses. Many documents cotemporary with Moses appear to be transcribed with entire fidelity; especially those inserted in the book of Numbers. In the Exodus, there are symptoms of epic embellishment; and there are directions for the priesthood, which cannot have originated in the wilderness; but imply a long established worship, and a curious progress in the arts of manufacture. In the Leviticus again, there is a great deal of legislation, which must have been subsequent to the conquest of Canaan. These circumstances do not invalidate, they corroborate, the historical importance of the Jewish scriptures; and encourage the antiquary to lean on them with confidence, as satisfactory testimonies of fact. The earliest sketch of the distribution of the primæval nations is that contained in the tenth chapter of Genesis. It is geography in the form of genealogy; as Bochart, Schloetzer, and Michaelis have evinced: as if we were to say: London is the son of

Middlesex, the son of England; or, as Ferishta does say: Dekkan is the son of Hind, the son of Asia; meaning that Dekkan is a subdivision of Hindostan, which is a subdivision of Asia. Now this tenth chapter of Genesis contains no traces of the Scythic empire in question; although it enumerates all the nations or tribes eventually comprehended under the sway of Cyrus, and Darius Hystaspis. The first state of all nations is anarchic. Each family submits to its own patriarch. It requires conquest to consolidate scattered villages under a common commander. Now Herodotus pointedly states Dejoces to have first combined the Medes; as the writer in Genesis states Nimrod to have first combined Babylon and the contiguous villages in Shinar. These petty exploits could not be still to perform, if there had already been an empire in that district. Among savages in the hunter-state every family has its separate language: the consociation of tribes for plunder or defence renders many words common to a whole district: at length a common sovereign and metropolis popularizes a common dialect. These nations are expressly stated to have differed widely in language from each other, and therefore to be separate. Of course they had never yet submitted to a common sway. Languages are confluent, not diffuent: the doctrine of an original language is opposed by the observations of all who have travelled among the savage nations, and is contradicted by the universal analogy of experience. Indeed, Mr. Pinkerton’s Scythian empire must be banished, with Baillie’s astronomical Siberians, among the reveries of irrational philosophy.

The second section investigates the meaning of the term Scythian. The word is very likely contracted from East-Goth: but it was certainly used by the ancients in the same indefinite manner as the Chinese use the word Tartar, or as we use the word *Indian*. We talk of Indians in Canada, of Indians in Peru, of West Indians in Jamaica. Thus Scythia is applied by the ancients to the whole *terra incognita* behind the Alps, the Carpathian mountains, the Euxine, Caucasus, and the Caspian. Scythians, according to Herodotus, are defeated by the king of Egypt in Palestine; Scythians are chased by Darius from the banks of the Dnieper: but who shall vouch for their being allied in language?

Within the Scythia of the antients may be traced each of the radical dialects of northern Europe. (1) Gaelic; for a tribe of Galatai, the Galatians of Saint Paul, came thence and settled in Asia minor: (2) Welsh, for the Kimmerioi, or Cimbri, once gave their name to a peninsula of the Euxine: (3) Gothic; for the Massagetæ, Mæso-goths, Visigoths, or West Goths, dwelt on the Araxes in the time of Cyrus, and made war against him: (4) Slavonic; for the language of the Medes was Slavonic, as Forster proves to Michaelis, and the \* Sauremadi, North Medes, or Sarmatic tribes, are placed by antient authors in Scythia. Scythian is plainly a vague name, which often includes Getæ, or Goths, oftener perhaps than any other of the four principal nations, or stem-tribes of the north.

The third section attempts to prove that the Celts were not driven to the farthest limits of Gaul 500 years before Christ. What does this author mean by Celts? According to Pelloutier, and the old antiquaries, all the northern nations of Europe were Celts: as well those who spoke the Gaelic, as those who spoke the Welsh, and those who spoke the Gothic tongues. Percy, in his Northern Antiquities, separated Pelloutier's Celts into Celts and Goths; including the Gaelic and Welsh tribes under the former denomination. Schloetzer, with more precision, separated Percy's Celts into Gales and Kymri, and strictly follows up the advice of Leibnitz, to class savage nations by their languages, which alter more slowly than their dwelling-places. Of France and England we know nothing satisfactory before Julius Cæsar; but it is evident that, in his time, the Gaelic tribes (who are the only proper Celts) were compressed into the westmost corners of Europe; and as the Belgæ (who are probably a Kymric, or Welsh, tribe) already dwelt contiguously to them, and were hitching westward, to make room for the Goths; it is not unlikely that this distribution had endured three or four hundred years, which is all that Mr. Pinkerton's hypothesis requires. As Mr. Pinkerton maintains that the Belgæ were Goths, he naturally somewhat antedates the westward progress of the Goths; for the Belgæ who dwelt westward of the Germans must have

preceded them in the progress from mount Ararat to capes Finistere and the Land's End.

This author says (p. 40) "there were only *four* races of people in Europe, known to the antients; these were (1) the Celts; (2) the Iberi; (3) the Sarmatæ; and (4) the Scythians or Goths."

Here is a mis-arrangement: the Sarmatæ, or Northern Medes, being a Slavonian race, dwelt eastward of the Goths, and consequently forsook Asia at a later period; they should occur last.

Here is also a defect of enumeration. The Celts should be subdivided into Gaelic and Cimbric. The Iberi are stated to have settled in the north of Spain. If, therefore, they are not comprehended in either the Gaelic or Cimbric tribes, they must be the progenitors of the people of Aquitain, who use the Biscayan or Basque language. This language is wholly distinct from the Erse or Gaelic, and from the Welsh or Cimbric. The Iberi might then form a *fifth* distinct race, well known to the antients, and specifically described by Cæsar. It is probable that they entered Spain from Africa, are no other than the Bastuli, and are the remnants of a Carthaginian, a Tyrian, a *Hebrew* tribe: they are denominated accordingly.

The fourth section discusses the identity of the Thracians, Illyrians, Greeks, and Italians, with the Scytho-Goths. No part of Mr. Pinkerton's hypothesis is more wild and untenable than the descent of the Greeks from a Gothick stock. Except the word *pur* fire, which Plato notices as barbaric, there is scarcely a Gothic word in the whole Greek language. The main body of Greek and Latin progenitors evidently migrated eastward from the original centre of population; for, in the Shanskreet language, the numerals and many other words agree with those of the Greeks and Latins. The Latin is Greek combined with a Gaelic basis; so that the primæval savages of Italy, who occupied the interior prior to the intrusion of the Greek colonists, must have been Galatai. That Goths, while in their pastoral state, wandered through Thrace, cannot be doubted; that Ovid learnt there a Gothic dialect, and wrote the first Dutch verses, is probable: but no wandering tribes should be denominated

\* *Saure* is a Slavonian word for *north*: in Lithuania, *Shaure*.

from their transient place of residence. The waves of population have been successively flowing westward through the middle zone of Europe; and the same nations which are first heard of in the Euxine are finally met with along the Channel. Throughout this section of the inquiry, our author has evidently the advantage of Mr. Pinkerton.

In the fifth section, on the contrary, which examines whether the Germans are Scytho-Goths, Mr. Pinkerton has the advantage over our author. This subject is continued in the sixth section, which includes an inquiry whether the Belgæ were Goths: this topic is not exhausted; but Mr. Pinkerton's opinion is sensibly enfeebled. The same investigation is pursued in the seventh section.

Whether the Picts, Piks, or Peucini, who first peopled Scotland, were a Gothic nation, is one of the most curious questions started by Mr. Pinkerton. We apprehend that he has established their Gothic origin, in contradiction to the received notion. The passage from Beda proves, that the Gaelic population of the Highlands came from Ireland after the christian æra. The Caledonians of Agricola were therefore Goths. And as the present provincial dialect of these Piks and Caledonians, in fact, extends southward at least to the Humber; it is highly probable that this is the first Gothic population which entered Britain. Our present language cannot be a corruption of the Anglo-Saxon, or Danish: the whole system of construction and inflection is different. Of the extant continental dialects, the Low-dutch most resembles our own. This, if the Belgæ were Goths, they no doubt imported; but it is on the whole more probable that the Belgæ, as Schloetzer maintains, were Kymri; because they were subject to the druidical or bardish discipline; because their language was with difficulty learnt by the Goth or German Ariovistus, or Ehrenvest; and because their name Belgish has been modified into the word Welsh. The Caledonians therefore seem to be the proper ancestors of the British nation, to have founded the main body of interior population, and to have furnished the basis of the language established by our worship and our literature.

The subsequent sections relate to topics less connected: it will be the easier to detach an independent passage: our

author seems most at home where Welsh antiquities are in question.

"We shall divide our animadversions on this point into two heads; the first, relative to the two distinct races of Celts, wholly differing from each other in language and customs; and the second, relative to the Belgic population, which he calls German.

"1st, The Celts.

"This principle, that the Celts were divided into two distinct races, was first advanced in the dissertation, to account for the striking traces of the Celtic people, which Mr. P. could not avoid discovering in various parts of Europe, even long after he had pent up the old Celts in the furthest west of Gaul, in the same manner as he afterwards made a distinction between the Celtic and German Gauls, to extricate himself from another dilemma.

"He conjectures that these people were separated into two divisions, the southern, or western Celts, or Celts proper, whom he places in Gaul; and the Cimbri, Cymri, or Northern Celts, 'the apparent offspring of the Celts proper, who, spreading into another region, had assumed a new appellation.' (Diss. p. 49.)

"He supports this conjecture by supposing, first, that the latter Celtic migrations were made from the west into Germany, and the north; and secondly, that the Gwyddelian language, or that of the first race of Celts, of which traces are still preserved in local names in England and Wales, was almost wholly different from the modern Cymraeg, or Welsh, and can alone be explained in the Irish, or Gwyddelian.

"The only proof of the first supposition he grounds on the authorities of Posidonius, Strabo, and Plutarch, who, he says, state that the Cimbri, or Cimmerii, came from the German ocean to the Euxine; and then he concludes that they originated from the north-west, from the constant burthen of his song, that the Celts were confined to the furthest north-west. (Diss. p. 48.)

"The two first of these authorities amount to a mere conjecture of Posidonius, which Strabo does not confirm, but only calls it not an inept supposition; and as to Plutarch, he acknowledges the extreme uncertainty concerning the origin of the Cimbri, and among several conjectures, states that they were supposed to have come from the Northern ocean. But his authority, if it proves any thing, proves the great number and power of the Celtæ at that period.

"The argument, in regard to the great dissimilarity of the Celtic dialects, namely, the Southern Celtic, or Gwyddelian, and the Cymraeg, or Welsh, is founded on the respectable, but in this instance, fallacious authority of Llwyd, the Welsh antiquary, who supports it by no historical documents.

"According to his opinion, the Irish, or Gwyddelians, were the original inhabitants

of England (Lloegyr), and Wales (Cymru), until they were expelled by the second race of Celts (or Cymry), and driven into Ireland. In favour of this assertion, he says, that many local names, even in Wales, and South Britain, are Gwddelian, and not to be interpreted by the Cymraeg, or Welsh.

"Many persons, wholly unacquainted with the Celtic dialects, have adopted this opinion, broached by a native of Wales, in its full latitude; and some, in support of a system, have even urged that there are but few terms, common in the two languages.

"However disagreeable it may be to derogate from the credit of a respectable antiquary, it is a duty we owe to truth, to prove that the system of Llwyd is essentially wrong. 1st, He instances the names Wysg, Llwh, Conwy, Ban, Trum, Llechlwyd, as only to be explained in the Irish language; an unfortunate selection! But each of these words is common in the Welsh, nay, more common, and of more various acceptations than in the Irish.

"With respect to Wysg, its abstract, or general import, is preserved in Welsh, whereas it appears in the Irish only as the term for water; but in Welsh, it is used as a noun, implying a tendency downwards, or to a level, as a stream or current: as,

"Od oes prydydd wydd di wysg,  
O Gymro hen digamrwysg,  
Attebed vi

John of Kent.

"If there is a poet, possessed of knowledge without bias,  
An old Welshman free from perverseness,  
Let him answer me.

"Llwh is equally common in Welsh as in Irish. It is one of those generic words preserved in most languages, and proves nothing; it is the English lake, the French lac, the Italian lago, and the Latin lacus. In Welsh, it strictly means an inlet, which, compounded with another word, becomes Llych; Llyn, also, in Welsh, is a term for a collection of water, or lake. These two words joined together, make the Welsh name for the Baltic sea, Llychlyn, that is, the Inlet lake.

"The compound Conwy is changed by Llwyd into Cynwy. In either case the component parts of the word are more common in the Welsh than in the Irish. It is formed of Con, what bolts straight forward, or runs to a point; and Gwy, in composition Wy. The first of these is not in the Irish; but Gwy, a stream, is common in both languages. To make Irish of Con, Llwyd turns it to Cyn, because Cean, as

written in that tongue, implies a head: and so it does in Welsh: besides, it has various other acceptations, unknown in Irish, and it is the root of a great multitude of words. The primary acceptations of Cyn, in Welsh, are, substantively, the first, or foremost part; adjectively, first, chief, or foremost; prepositively, before; adverbially, ere, sooner than; also a prefix of general use in compositions.

"The next word is Ban. It is singular that Llwyd should have forgot that it was Welsh; for it was one of the most common words, and of general acceptation. It implies a prominence, a height, what is conspicuous, and is the name of several mountains; ban hydd, the antler of a stag; ban pennill, the head, or division of a stanza; ban cowydd, the distich of a poem. It is also an adjective, conspicuous, high, lofty, as, illas ban, a loud voice. It is the root of a numerous family of words.

"The word Trum, a back, or ridge, is common in the Welsh and the Irish. Trum y mynydd, ridge of the mountain; trum y ty, roof of the house; trum grwn, the elevated part of a ridge of ploughed land; rhych a thrum, furrow and ridge. It is also the root of many derivatives.

"The last example is Llechlwyd, a compound word, literally implying a grey flag; a term equally familiar in Welsh, with grey flag in English.

"Such are the words brought forward by Llwyd as not Welsh. But this singular perversion is the less surprising, as Llwyd, though a man of considerable learning, was of a warm and visionary temper, and a great builder of systems.

"In regard to the second point, that there is little similarity between the Irish and Welsh, we have reason to assert, that out of 25,000 words in the Irish dictionary, 8,000 are decidedly common words in Welsh. Most of the general prefixes and terminations of the different classes of words, which the Irish have, are also used in Welsh, besides various affinities of idioms and construction."

This book tends more to affect Mr. Pinkerton's reputation for fairness of citation than for sagacity of inference, and to make him pass for a dashing, but not for an injudicious, antiquary. It throws little new light on any of the topics agitated; it withholds much old light, groping in mist and stumbling at difficulties, which were long ago removed by Schloetzer, whose Northern History appeared in 1771.

ART. III. *Sketch of the early History of the Cymry, or Ancient Britons, from the Year 700, before Christ, to A.D. 500. By the Rev. P. ROBERTS, A.M.* 8vo. pp. 176.

TO Mr. O. Jones, by whose patriotic liberality the publication of so many an-

cient records of the Welsh has lately been effected, not only the British but

the European public are indebted:—These documents throw light on that interval of Cimbric or Armorican independence, during which all that is most peculiar in the character of modern Europe seems to have been hatched, as in its nest. The observations of Gibbon (vol. iii. page 275) by no means exhaust the philosophy of a period, too little contemplated both by French and English antiquaries.

The author of the sketch before us has consecrated his talents and learning, which are considerable, to the illustration of this obscure but important corner of the earth; and has endeavoured to separate, from the confused mass of Welsh traditions, a probable account of the filiation of British sovereigns, and of the migration of the early settlers. The first remarkable disquisition of the text respects the Gafis of Taliesin. We shall report Mr. Roberts's opinion:

“However idle the Trojan part of this history, (the history of Brutus and his colony) and however ill-connected with the rest of the very history in which it is found, its advocates were thus far justified, that it was to be found in the Welsh history, from whence Geoffrey of Monmouth composed his; and that such a Welsh history still subsists. As the error of the history appears to have originated partly in ignorance, and partly in a mistake, respecting the person called Brutus by the historian, we may safely set aside this part of the narrative, which has so long been an embarrassing difficulty to those who have endeavoured to investigate the real history of the Britons, and proceed to state their history, as deducible from the documents before us.

“According to these the colony of the Cymry, or Britons, which first took possession of this island, came originally from Asia. In a poem of Taliesin, which is called *the appeasing of Lludd*, the following very singular passage occurs:

“Llwyth lliaws, anuaws ei henwerys,  
Dygorescynan Prydain, prif fan ynys,  
Gwyr gwlad yr Asia, a gwlad Gafis;  
Pobl pwyllad enwir, eu tir ni wys,  
Famen gorwyreis herwydd Maris;  
Amlaes ei peisiau, pwy ei hestelys?  
A phwyllad dyfynyr, ober efnis  
Europa.

A numerous race, fierce they are said to have been,  
Were thy original colonists, Britain, first of isles,

“Natives of a country in Asia, and the country of Gafis;  
Said to have been a skillful people, but the district is unknown  
Which was mother to these children, warlike\* adventurers on the sea,  
Clad in their long dress, who could equal them?  
Their skill is celebrated, they were the dread of Europe.

“In these few lines the poet has given the peculiarities of national character and dress, and the origin of the nation, as far as he was able to trace it. The character of the nation, as warlike† adventurers on the sea, in the spirit of the times, however opinion as to the mode, may since have varied, every Briton will with pleasure find to have been considered by the poet as marking a naval superiority inherited by Britain; and it is that of the present times, that it never was more justly or more gloriously asserted.

“As to the particular part of Asia from which the first colony came to Britain, the poet candidly acknowledges that he is not able to point it out exactly; though he endeavours to do so in some degree by the name Gafis.

“A city, whose name nearly resembles this, was once the capital of a province in a part of the present Usbeck Tartary. Gabis the capital of Gabaza; but this is too far to the East of the route of the Cimmerians to admit of the supposition of its being the place intended by the poet, further than as intimating some place bordering on the Caspian Sea. Perhaps the name is to be found in Panticapes, the modern Kassa; as this word, of Cimmerian origin, should be written Pant-y-Capes, or *the declivity or valley of the Kapes*. This seems the more probable from the similarity it has to the modern name, and will be more so, if it appear, that this was the country from which they came.

“Concurring with Taliesin, the Triads give the following information:

“The first of the three chieftains who established the colony of Britain, was Hu *the mighty*, who came with the original settlers. They came from the Summer Country, which is called Deffrobani, that is where Constantinople is at present. Triad 4.

“They came in search of a settlement to be obtained not by war or contest, but justly and peaceably. Triad 5.

“There can be no doubt but that Asia is meant by the words Summer Country, and that Deffrobani was added to mark the particular district. The exposition of the name is less certain. As an exposition it must have been added to the original Triad, (when the first reference was in danger of being unintelligible,) according to the tradition of the

\* In these early ages adventures of this kind were not deemed dishonourable.

† Strabo says, that the Cimmerians, when expelled from the Chersonese, became adventurers.

age of the writer; which as an exposition is of use, as it gives a distinct circumstance in the history, and one that is of importance."

Both in the middle and early ages, the Roman ideas probably prevailed at the extremities of their empire. The eastern and the western world, separated from each other by the Euphrates, or the coast of Syria, and distinguished by the names of Asia and Europe, constituted the prominent, popular subdivisions of the earth. Whatever was not Europe was Asia, in the notion of the vulgar geographer; hence Phœnicians, with their long dresses, whether they came from Tyre, from Alexandria, from Carthage, or from Cadiz, would equally be described by a Welsh bard, as coming from Asia; that was the *terra incognita*, of which he had learnt the collective name. In the time of Taliesin, Tyre and Carthage were no more. Had the people he describes come from either of these cities, according to the records preserved, it is probable that he would substitute some extant, real and familiar name, to a name which he would suppose fictitious, because extinct; it would not shock him to place a sea-port in Bohemia, or Tyre in Tirol; but he would take the most analogous and resembling known name, instead of the obscure name of his older authority; in short, he would change Carthage into Cadiz, and place this Gafis in Asia. There are but two great cities, by the destruction of which the Phœnicians can have been driven to settle in Britain: Tyre and Carthage. It is more probable, that the latter should have given origin to the colony, of which so many consistent records conspire to prove the migration, than the former; both because the Tyrians are well known to have distributed themselves chiefly among the Mediterranean sea-ports, and because Britain was ill-known at the time of the prosperity of Tyre. But, before the destruction of Carthage, it was already frequented by ships from the Mediterranean; nor was the distance from Cornwall to the Straits, such as to alarm a colony of merchants. This is further corroborated by the geography of the Triads, where we are told that the original settlers came from a summer country, called Deffrobani, which is evidently a corruption of Africani, an assertion that they were Africans; Africans from the Mediterranean, where Constantinople is at present.

The following observations on the language of the Iceni do not appear to us convincing:

"Cunobeline, the next in succession, married Areddawg Foeddawg, daughter of the traitor Afarwy, the too well known Cartismandua of Tacitus. Attached to the Roman interests, he appears to have favoured their views, and to have imitated them. To this connection with the Romans he perhaps owed his knowledge of coining money; and to him the only coin that has a name properly Welsh, owes its appellation; that is the *Cœniog* or Denarius; which, there is no great risque in saying, was originally called *Cunog*, and softened afterwards into *Cœniog*. It is at least the only probable etymology of the name I can find. The word *Tascio*, on the reverse of his coins, seems to be Gaelic, or the dialect of the Logrians, and to signify the *Mint* or *Treasury*, as in the Irish the word *Taisgish* signifies *hoarding*, and *Taisgiodan* a *store house of arms*, &c. *Armarium*. Lhuyd As Cunobeline was king of the Iceni, the inference is certainly that their language was the Gaelic."

Why may it not be suspected, that the word Iceni is of the Gothic origin, signifying *oak-men*; either in the sense *hearts of oak*, or *dwellers among oaks*? The word *Coning*, or king, and the word *Tascio*, purse or scrip, are as explicable in Gothic as in Welsh; nor is the name Cunobelin unlike *Kuhn-bald*, soon bold. There are so few traces on the *Saxon shore*, or eastern coast of any British or Celtic population, that strong proofs must be exacted from the antiquary, who would have us believe that Welsh was ever spoken there.

A very interesting illustration of St. Paul's second Epistle to Timothy occurs: it appears that the Claudia of scripture was a relation of Caractacus.

"When this hero went to battle, says the Triad, 'none would stay at home. They followed him freely, and maintained themselves at their own expence. Unsolicited and unsoliciting they crowded to his standard.' Triad 79. Such was the admiration of the character, on which adversity in the extreme could alone throw greater lustre.

"Disastrous as the fate of Caractacus was to Britain at the time, HE whose providence brings good out of evil, made his family, even in their captivity, a blessing to their country. His family, captives in Rome, there learned the great truths newly revealed to mankind; and Bran his father returning to Britain, after seven years captivity, as an hostage for his son, first published them here, Triad 35. A convert to the gospel, he became a reformer of the manners of his countrymen; his name with the epithet *blessed* annexed, is

therefore joined with those of Prydain, and Dyfnwal Moelmud, as one of the three who healed the disorders of the kingdom; Triad 36. Of the descendants of Caractacus none returned, Triad 61. It is therefore to be presumed, that Claudia Rufina was of it, to whose beauty Martial has paid so handsome a compliment, in the well known epigram of which this is the purport:

‘ If Claudia’s of the woad-stained British race

Whence is that lovely form, that heavenly face?

Why does the Roman, and the Grecian dame

Dispute her birth; and urge a jealous claim? Thus blest, ye Gods, still bless the happy pair,

And make their offspring your peculiar care; Her love his only, mutual be their will, And may her sons her latest wish fulfil.’

“ That this Claudia was a christian is confirmed by St. Paul’s second epistle to Timothy, chap. iv. ver. 21, in the salutation from Pudens, Linus, and Claudia; as Pudens was the husband of Claudia, and Linus most probably their son. The assertion that Bran was a christian is therefore countenanced, not only by this circumstance, but by the unceasing and lively exertions of the primitive christians in the relief, consolation, and instruction of all who were in affliction, as he must have been, where he was a captive and a stranger.”

An attempt, but not a very successful one, is made to illustrate the history of Ambrosius, or Merlin. The reign of

Arthur is on every account highly and generally curious; but until the publication of all the romances concerning him shall be completed, (and there are no doubt several in Welsh) it will be impossible to appreciate the antiquity, and consequently the probability of the different and often discordant traditions.

Some observations also occur on the nineteenth triad, in which it is said; that the three blessed guests of Britain (that means the missionaries who first converted the British) were Dewi, Padam, and Teilo. Here is obvious mention of David, the favourite saint of the Welsh, and of Patrick, the favourite saint of the Irish; but who is Teilo? Is this the St. Olave, of whose ancient popularity so many churches and streets bear witness? St. Tooley, as the English say.

Among the Cimbric antiquaries, a little national vanity gleams forth, which leads them into credulous and injudicious propositions; but with a few deductions for the diverting hallucinations of their provincial patriotism, they are pouring into the reservoirs of antiquarian science, new, important, and numerous discoveries. We rejoice at every accession to the number of labourers; but we wish that to translate exactly, and to publish with integrity, every remaining document, were considered as a business essentially prior to the discussion of their historical contents.

ART. IV. *The History of England, from the Peace of 1783, to the Treaty concluded at Amiens in 1802; being a Continuation of COOTE’s History of England. By the Author of the former Part.* 8vo. pp. 446.

“ COOTE’s History of England, from the Dawn of Record to the Peace of 1783,” has not been received by the public with a welcome proportioned to the length of toil, the neatness of redaction, and the equity of estimate displayed. It has here been continued with patient expedition, and undeviating propriety to the conclusion of the treaty at Amiens in 1802. Only this concluding volume belongs within the limits of our horizon of observation.

In a history of England, during our own times, the leading facts are of course familiar. The plan of detailing them is in some degree pre-established. There must be alternations of debates and of narrative. Parliamentary discussions and practical operations must succeed and influence each other, like the strife of gods and men in the Iliad.

But as parliament is become rather more an organ of public instruction, and rather less a seat of national volition than formerly, it ought in some degree to make room for the political controversies of the press, which now chiefly call forth what there is of independent opinion in the country. We could have wished, therefore, to see distinct chapters consecrated to the literature of the leading questions in discussion; and should recommend the annexation of regular notices of the principal topics of public attention, whether political or not. We value tranquillity the less, and those talents which it evolves; because historians neglect to record and appreciate their exertion. The art of amusing the peace of the civilised, is one of the arts of preserving it. From the insipid feasts of the Ethiopians, Jupiter returns

to meddle in the wars of men; but had he found there Juno girded with the cestus, Greek and Trojan might longer have been at rest.

This volume comprizes a convenient epitome of the whole Pitt administration, which may be divided into two main segments: the portion conducted in opposition to Mr. Burke, which was characterised by a compromising, accommodating cast of politics, and was liked; and the portion conducted in unison with Mr. Burke, which was characterised by an intolerant, malignant cast of politics; and was odious. We shall bestow on it a sort of perpetual commentary.

The coalition with Lord North was probably recommended to Mr. Fox by Burke, in order to destroy a popularity he envied; aware that the more vehement partizans, who preferred Fox to him, would be precisely the repelled portion of their supporters. The popular animosity felt against this coalition was a correct feeling; for it really tended to disband popular principle, to destroy personal confidence, and to render impossible to the people the attainment of any one end by confederacies of their own. Yet the conduct of the coalesced parties was patriotic, and favourable to an increase of the power of the representatives of the people. Mr. Pitt was lifted by the ebb-water of that tide of popular favour which had billowed about Mr. Fox. His first conspicuous act was to disclaim (on the 12th January, 1784) all thoughts of resigning his post, in compliance with the declared wish of the majority of the house of commons. It is, no doubt, the traditional or constitutional prerogative of the crown, to name or elect the ministers of Great-Britain. But, as the patronage of government gives to such ministers a far-felt power over the house of commons, it is highly improbable that any set of placemen should be left in a minority, who are not either incapable or odious. Incapable ministers should be removed for the public safety; odious ministers should be removed, because civility is due to the people even when they err, and because a tacit complacency in the subject is essential to the efficacious execution of public measures. The house of commons have, therefore, usefully set up the doctrine, that a minister censured by them is

bound in honour to resign; and this doctrine it is expedient for the people to prop them in enforcing. If the right of expulsion vested in the house of commons, the expulsion of a refractory minister, when a commoner, would be a fit mode of enforcing this propriety in political behaviour; but the Rockingham administration, in every thing a suicidal party, had set aside this right to please the friends of Mr. Wilkes. The old remedy of withholding the supplies is clearly inapplicable to a country burdened with a considerable national debt, because it is a measure far less alarming to the crown than to the stockholders. Another remedy would be to refuse passing the mutiny-bill; but this is only applicable in a state of peace. So that the house of commons has still to devise some innocent mode of enforcing its highly desirable negative on the ministerial nominations of the crown. Perhaps the civil list could conveniently be separated into its national and personal grants, and the latter voted annually.

Mr. Pitt's second conspicuous measure was his India-bill. Mr. Fox had devised one which contemplated the dissolution of the company, at the expiry of the charter; and which proposed to vest in commissioners, elected by the house of commons, the eventual patronage of India. The benefit which commercial men must have derived from the opening of the trade to India is incalculable. The possession of patronage, by the house of commons, no doubt tended to alter the leaning of the constitution, to counteract the influence of the crown, and to make parliament a seat of independent volition. Mr. Pitt's bill contemplated the prolongation of the company's monopoly; and the addition, through the board of controul, of the patronage of India to the extant influence of the crown. But it tended to make rival powers of the company and of the governmental establishment, and thus to endanger the eventual dependence of India: whereas, under Mr. Fox's bill, an adhesion to the British house of commons, must have been very strong and very lasting. Distant patronage is of little consequence as an engine of favouritism, because it banishes the person it attaches; but it is of great consequence as a motive of allegiance, because it operates at the ex-

tremities of empire : it is therefore, the sort of patronage which the prince may best resign to the state.

The commutation of the duty on tea for a duty on windows, conduced much to the suppression of smuggling, and to the increase of the revenue. It was the plan of Mr. Richardson, late accountant-general at the India-house ; but it was brought forward without any mention of him. It seems expedient, however, and liberal, to name the projectors of considerable innovations at the onset, that a proper recompense may be conferred when they succeed. It is not the necessary province of a minister to project ; but to select the sound and practicable projects of others.

In 1785, the commercial propositions for an unrestricted intercourse with Ireland, were brought before both parliaments. These propositions did honour to Mr Pitt : they seemed natural and obvious consequences of the maxims respecting trade, taught in Adam Smith's *Wealth of Nations* ; but after being accepted in the British parliament, they were withdrawn in the Irish parliament, apparently out of a weak deference for the clamor of a combination of English manufacturers. It is worthy of remembrance, that during the debate on this topic, Lord North expressed his wish for a complete incorporation of the two kingdoms, rather than a partial settlement.

In 1786, a commercial treaty with France was concluded ; it resulted from the same liberal spirit of commercial policy as the Irish propositions. At first it was an equitable treaty ; but it was rendered an unfair bargain for France, by the subsequent and somewhat perfidious diminution of duty on the wines of Portugal, which cheated the French of their expected market for wines in Great-Britain. Unfair bargains between nations are seldom permanent : hostilities are often got up for the sake of breaking them. Unless reciprocal sales approach equality, the motive for confiscation in case of rupture is greater on the one side than on the other : and thus the party at first most benefited by the intercourse, is eventually the greatest sufferer by it on the termination. Let justice be done, and one may defy the gathering cloud.

About the same period, a highly meritorious provision was made for the pro-

gressive extinction of the national debt : features of the plan had been devised by Dr. Price, but were adopted without acknowledgment. The useful colonization of New South Wales was undertaken with insufficient preliminary survey. The Prussians were encouraged to invade Holland, for the purpose of propping the Stadtholder's tottering authority ; but as no constitutional changes were enforced, he became, on the retirement of the Prussian troops, weaker than before ; and incurred the odium without the fruit of foreign interposition. This interference was applauded in parliament, even by friends of liberty, although Great-Britain neither obtained the Cape nor any other recompense for her indemnity : but Mr. Pitt was now in the perihelion of his popularity ; the mildest criticism of an adversary would have been mistaken for envy.

In 1787, Mr. Pitt declared against the repeal of the corporation and test acts. Brought up by an ecclesiastic, without the advantage of a travelled education, and very ignorant of continental literature, it was not surprizing that Mr. Pitt should betray in the face of Europe a narrow bigotry, and want the courage to dictate liberality to a bench of bishops he had nominated. In a legislative point of view the innovation solicited was inconsiderable. Granted with speedy decision, it would have produced little effect. Its importance resulted from the very large proportion of the people, especially of the middle classes who became partizans in the controversy. There is scarcely a market town in the kingdom where the sectaries have not some hall of worship : in all such places an active circulation of pamphlets concerning toleration, was kept up by their ministers and congregations. All the solitudes of petty promotion, which mightily interest the secondary classes, were aroused ; the computation began to be made in every corporation, in every excise-office, how many persons the dissenters would be able to put in ; and thus an extravagant degree of zeal was kindled, both for obtaining and withholding the repeal. As the sectaries do not exceed a tenth of the community, it is honourable to the state of national culture, that they so nearly divided the general wish. In the educated classes their cause had a majority. The

dissenters, however, were too obstreperous; and, having become ashamed of their own urgency, they sought to engraft questions more momentous on their original object. They boldly promulgated, but in a form less philosophical, those principles respecting the establishment of religion, which Adam Smith has defended in the third article of the first chapter of the fifth book of his *Wealth of Nations*. Lord Bacon declares himself an episcopalian, Hume a presbyterian; but Adam Smith an independent, in his idea of church-government. At the symptoms of a league between philosophy and fanaticism, an established clergy may be allowed to tremble: a cry of the church is in danger, corroborated the decision of Mr. Pitt, and rendered the repetition of his refusal less obnoxious than its original publication. The refusal produced, however, a bad effect. The dissenters were irritated by it in a degree proportioned not to the magnitude of their object, but to the zealotry of their pursuit; and this irritation had not subsided, when the French revolution began to occasion the profuse circulation of enquiries into the principles of governments, and of disquisitions on the rights of men. By every publication which tended to attack the theory of the British constitution, and to sap the allegiance of English subjects, the dissenters, by a natural and necessary consequence of the displeasure excited in them, were more powerfully acted upon than their fellow-citizens. Hence they celebrated, with a forwarder zeal than others, the anniversaries of French liberation; and patronized, with distinguishable liberality, the foundation of popular pamphlet-clubs. In short, what was called the jacobinism of Great-Britain, that is, the confederacies of undervaluers of church and king, for nobility has no enemies in this nation, in a great degree sprang out of Mr. Pitt's discountenance of the dissenters. It is true they cooled, as the multitude heated; and the dissenting teachers gradually abandoned the propagation of opinions to the gallicizing philosophers: but among them had originated a complexion of sentiment not easily distinguished from republican. Nor was this effect confined to Great-Britain. The books concerning toleration, to which the controversy about the test-act gave rise, began indeed with exclusive claims

of unmerited preference, but gradually attained a juster temper, and contended for the political equality of all religious sects. The catholics became interested in the controversy, and applied to the parliament of Ireland, for a restoration of their civil rights. The same conscientious cowardice repeated the same unfortunate refusal, and excited in Ireland an analogous, but a more vehement discontent. The horrors of the catholic persecution which ensued, have sullied the national annals, and have endangered the historical comparison of a protestant sovereign with Philip II. and of his minister with the duke of Alva. May their penitence wipe away the remembrance, though it cannot the mischief of their intolerance.

In 1788, a bill called declarative was brought in to strengthen the power of the board of controul, at the expence of the directory in Leadenhall-street. By this time the tendency of Mr. Pitt's bill to separate the company and the board into hostile authorities, would have become very apparent, but for the impeachment of Mr. Hastings, which furnished them with objects of co-operation, and kept alive their common jealousy of the framers of the rejected India bill.

About the close of the same year, the illness of the king rendered a regency-bill necessary. Mr. Pitt claimed, on behalf of the lords and commons, a right to appoint, with arbitrary limitations, the new executive power. How unconstitutional this doctrine was, soon became visible; for the two houses in Ireland appointed an unrestricted regent, and the two houses in England a limited council of regency; so that, if the king's disorder had continued, the two countries would have been virtually separated by law. This doctrine of Mr. Pitt's was consistently welcomed by the republicans of England. Now that the two kingdoms are united, its dangerous tendency, as far as respects separation, has ceased: its republican tendency alone remains.

In 1789, Mr. Pitt applauded, with inactive philanthropy, the benevolent proposal of Mr. Wilberforce to abolish the slave-trade: an adjournment was voted to the year 1796; but the house was dishonourably suffered to forfeit its pledge.

In 1790, an armament took place against the Spaniards, respecting Noot-

ka: arrogant claims were advanced, and softened down on the prospect of French resistance. Another armament took place against the Russians, for reasons as insufficient, and with a retrogradation more humiliating. It was besides a wholly mistaken policy; a capital diplomatic blunder, to thwart the politics of Russia. While the French were busying themselves at home, the projected partition of Turkey would have saved Poland, strengthened Austria, and helped *us* quietly to Egypt.

About the year 1790, the politics of the French, which already divided into factions the reading world of Great-Britain, became topics of discussion in the British parliament, and produced a declared disunion, first of opinion then of conduct, between Mr. Burke and Mr. Fox. Mr. Burke and the Rockingham party went over to Mr. Pitt: Mr. Fox and the Lansdowne party remained in the opposition.

From the moment of Mr. Burke's accession, the government began to lose its temporizing, accommodating, lenient cast of policy; and to breathe only malignity, intolerance, and persecution. The very temper of the nation seemed to change. Riots at Birmingham and elsewhere razed the houses of the enthusiasts of liberty, and broke the gaz-jars and electric batteries of Priestley.—Proclamations were issued against republican pamphlets, as if the discussion of the most expedient form of government was not precisely the most valuable liberty of the press. Prosecutions for libel were successfully instituted. Aliens were deprived of the benefit of law, and subjected to the arbitrary controul of ministers. An anti-jacobin war was undertaken, in concert with most of the sovereigns of Europe, accompanied with the mischievous renunciation of all established principles of warfare.\*

The project of parliamentary reform

suggested by the friends of the people was not honoured even with an inquiry into the allegations of their petition. Barracks were erected. The Habeas Corpus Act was suspended; and the faculties of speech and hearing were paralyzed by inquisitorial spies. The more popular arguers against ministry were arrested, and calumniously indicted for high treason—Tooke, Holcroft, Thelwall, and many others.—The pretended proofs of guilt were contemptuously thrown back at ministers, by a wondering jury. These trials cast an amusing light on the conspiracy of the clubs, which appeared to be mere societies for political information, where a contrived preference was given to pamphlets and speeches of a democratic and republican tendency. In the represented towns these clubs were well adapted to turn the tide of popular favour against ministerial candidates.—They formed convenient centers of application, when petitions were wanted to prop parliamentary motions: their continuance would probably have enabled the numerous classes to obtain the redress of several grievances, as a repeal of the laws prohibiting the combinations of journeymen, and other similar restrictions. The congratulatory addresses to the French seem to have flowed from the vanity of consequence, but they tended to endanger purity of allegiance.

By the preceding severities, the sovereign had been rendered unpopular; by this mortifying defeat his unpopularity became notorious. Ministers affected to delight in the vulgar aversion now loose-tongued on all sides. Earl Fitzwilliam was recalled, for betraying a disposition to redress the grievances of the catholics. The king was insulted (on the 29th of October, 1795) in his way to the house of lords, with the hisses, groans, and peltings of a conspir-

\* Mr. Burke had written, and was not disavowed by ministers in coalition with him, the following passage: "If ever a foreign prince enters into France, he must enter it as into a country of assassins. The mode of civilised war will not be practised; nor are the French, who act on the present system, entitled to expect it. They must look for no modified hostility. All war which is not battle, will be military execution. This will beget acts of retaliation, and every retaliation a new revenge. The hell-hounds of war on all sides will be uncoupled, and unmuzzled." This passage was pleaded in the French Convention, as an excuse for passing the decree to give no quarter to prisoners: a decree which the French officers nobly refused to execute. The writings of Mr. Burke, as was well observed (surely by the excellent Mr. Hall, of Cambridge) contain all beauties but those of the heart. There is an Irish ferocity about them, a selection of crime and horror, as the favourite objects of contemplation, which is repulsive to benevolent natures.

ing multitude. New treason laws were\* proposed by Mr. Pitt and Lord Grenville. Rebellion and horrid havoc broke loose in Ireland, and were with difficulty restrained in Scotland and in England. At length ministers determined to negotiate for peace, and the public mind softened.

A meritorious treaty of commerce had been concluded in 1794, with the American states: but the judgment frequently displayed by Mr. Pitt, in questions of commerce and finance, deserted him in 1796, when his subsidies reduced the Bank of England to stop payment. It was proved that excessive advances to the government had occasioned the temporary embarrassment: a loan to repay these advances, and a speedy coinage of specie, would soon have restored the ancient order of payment, particularly after the publication of accounts which demonstrated the solvency of the bank. A preference was unwisely given to that system of forced circulation, which continues to enrich the proprietors of bank-stock, and to alarm and oppress the inferior classes of commerce; and which, in case of invasion or public terror, threatens to render impracticable in the metropolis the payment of the taxes or of the stockholders.

In 1797, Lord Moira and Mr. Fox strenuously recommended in parliament, to ministers, a milder conduct towards the Irish than was unhappily adopted. —Repressive measures were employed which no provocations could have justified: tortures, burnings, capricious desolations, arbitrary executions, precautionary slaughter. Before the resort to such extremities, ministers ought to have made the emancipation of the catholics a condition of their continuance in office. That is a tardy humanity which only sets in, now they have ceased to be the persecutors employed.

After alluding to atrocities which exact the moral indignation of the calmest historian, it is scarcely excusable to waste criticism on the conduct of the foreign war. Yet it deserves perpetual notice that the fanaticism of the anti-jacobins was the principal cause of its misconduct, and that the interests of the nation were in every thing forgotten for the interests of the sect. Time was when

the Girondist rulers of France had indirectly offered, through the mouth of Condorcet, the cession of Madagascar and its appurtenances to Britain, as the reward of little more than the bare recognition of a forthcoming constitution, which by subdividing France into separate federal states, would have paralyzed her strength for future offensive warfare. The creed of the anti-jacobins forbade the acknowledgment of authorities originating with the people; and the opportunity was lost.

Time was, after the taking of Valenciennes, while the Prussians were yet hesitating to secede from the coalition of sovereigns, when peace might probably have been renewed, without any other annexation than that of Avignon to the original territory of France. But the spirit of anti-jacobinism was as yet so strongly bent on the restoration of royal unrestraint, that with a sanguinary sanguineness, which the Brunswick manifesto will too long record, the opportunity was lost.

During the negotiations of Lille, if a very liberal confidence, bordering on personal despotism, had been bestowed on the noble agent, sufficient to authorise his bold and instantaneous decision there, it is likely that an equitable peace could have been concluded, prior to the victory of the war-faction in the directory of France. But anti-jacobinism had still its prejudices to overcome against a peace with regicides; still some gay hopes to gamble upon, still some inkling to turn up a king. This opportunity again was lost.

The same cavalier indifference, which prevailed about the continuance or cessation of the war, prevailed about its conduct. Dodging invasions, which might provoke and could not maim, were tried at Quiberon and elsewhere, as if merely to profess our royalism, and kill off our guests. Corsica was idly taken under our protection, because it preferred a constitution with half a king to a constitution without one. It was evacuated still more idly. If retained until peace, it might have been allotted to the king of Sardinia, in exchange for his Savoy or Piedmont. This, to men of honour, was always a sufficient motive for the retention. But the even-

\* In what proportion the people were divided for and against the spirit of the government, may be inferred from the petitions presented on this occasion: there were 65 petitions (says our author, p. 289) with 30,000 signatures *for*, and 94 petitions with 130,000 signatures *against* the bills.

tual value of Corsica became immense: it would cheerfully have been paid for—with Pondicherry, that flaw in the oriental jewel—or with Demerary, the sink of so much spiritedly expended commercial capital—or with Martinique, which had learned the profit of subjection to Great-Britain—or with the Cape, so admirably surveyed for the use of other landlords,—or with Malta, the key that unlocks for its possessor the barrier-gate of Europe—by a sovereign, who was a foreigner while Corsica was not French.

On the continent of Europe, England had but one interest—to prevent the *northern* aggrandizement of France, the extension of the French line of *coast*. Any other form of growth might take place, without detriment to us. It was our obvious policy then to secure, at any price, the alliance of Prussia, which could alone defend and incorporate and preserve the north; and by the gift of Hanover, (born and educated a Briton, the owner would no doubt have gloried in the sacrifice, and the country would as willingly have granted profuse millions of indemnity) to purchase a repetition of the campaign of 1787, which delivered Holland from French ascendancy. The alliances of both Prussia and Austria are not permanently compatible: their interests in Germany are hostile, and on those interests their favourite politics turn. It was expedient, therefore, to renounce all connexion with the Imperial cabinet; or even to incur its enmity, for the sake of the consequent amity of Prussia. What was it to us if the French had dictated a peace at the gates of Vienna; and if they had usurped suddenly the whole of Italy and the Morea and Egypt? Such sprawling accessions to their dominion, would have been more costly to garrison, and far more difficult to guard from subsequent rebellion, than the compact contiguous Delta of the Rhine. Yet the fleets of Britain, and the troops of Russia, could be brought to interrupt the southern progress of the French; while only feeble, after-date, ill-directed, aguish expeditions, were run aground in Holland. But Holland was merely a republic overthrown: in Italy there were two kings and the bishop of bishops to save. Of course the interests of the country were to be betrayed for the interests of the creed.

How fine a force of ships and men

was sent to the West-Indies. Those who saw the earlier embarkations of the troops, will long remember the glorious show: the sparkling pomp and scarlet magnificence of their attire—their arms glittering in novel polish—their movements drilled in punctual grace—their march on board, amid Rule-Britannias, performed in anticipated triumph, with the sonorous skill of an assembled orchestra—tall picked soldiers panting for adventurous tasks, collected before the land was exhausted by recruiting, or compelled to seduce awkward labourers from productive industry—men bounding with youth, glowing with health, stately with courage; models for a painter or a sculptor; worthy to be the patriarchs of a new Circassia—and about what were they employed? To preserve some sugar-islands from negro-insurrection for the French. Jealousy against liberty formed the basis of the creed of anti-jacobinism: it seemed, therefore, the wisest employment of the country's strength, to keep under the revolt of slaves, without even the simple reckoning whether the insurgents were the property of the adversary, or our own.

If half the men buried in San Domingo had been landed at New Orleans, new Talbots would there have planted successfully the ensigns of Britain, and have added to the property of the English crown, the whole course of the Missouri.—The royalists of France might there have found, under our sway, a safe asylum, and would have hailed, with willing lip, Louisiana as their country. Embracing, as in a belt, those colonies of which we had already fostered the adolescence and conceded the emancipation, these new districts would in their turn have received our language, our industry, and our laws. They have indeed passed into pure hands; but the redundancy of British population and capital, would more rapidly have scattered and made to germinate there the seeds of prosperity.

In 1797, Mr. Burke died, long the most brilliant ornament, latterly the misfortune of his country. The principles of the *ligue* were those which, from the writings of French jesuits, he transplanted into England, and they at one time seemed in danger of leading to similar proscriptions of the incorrigible among his opponents. Mr. Pitt's genius evidently felt rebuked before him; but resumed, after his departure, a more Eng-

lish-tempered policy. After the extinction of the Girondist party in France, the war gradually ceased to appear a crusade against liberty : after the negotiation at Lille, it ceased to appear aggressive, and was become really national before its close. The accession of Bonaparte was a moment at which an honourable peace might have been obtained. The early interests of his popularity and power, seemed to require a pacific policy, and would have inspired a concessive spirit. The contemptuous refusal to negotiate with him, of which Lord Grenville was the herald, served to inroot a formidable hostility against this country, in a soul before disposed to value the opinion of Britons. This refusal in our ministers, probably arose from a culpable ignorance of the personal character and disposition of that distinguished general. He had been erroneously called by Mr. Pitt, "the child and champion of jacobinism," although in early life he had betrayed a warm anxiety for the escape of Louis; although his first step to power was a repressive massacre of the jacobins, when under the guidance of the sections of Paris, they revolted against the Directory; although his religiosity was proclaimed by the obsequies of Pius VI.; although his selection for the supreme office, from among the other generals of France, arose from the conviction of Sieyes and the jesuitic party, that he would restore the church; and although his elevation was itself accomplished by the dismissal of the representative authorities. In short, Bonaparte was the real chieftain of the church-and-king party of the French, or what Mr. Burke calls "the moral king of France;" and thus he was the natural object of anti-jacobin recognition, though of mistrust to the friends of liberty.

This opportunity having been lost, the best chance for obtaining equitable terms of peace, would have been to intrust official situations to those persons of antient and European reputation for talent, who possessed the confidence of the original adversaries of the war, and who therefore could alone have called forth a more diffusive energy in case of the renewal of hostilities. They only would have negotiated on the highest possible ground; but the persons employed; had they ventured to be nice, must have resigned to their predecessors.

The peace, like the war, suffered from the obstinate intolerance of anti-jacobinism.

In 1799, the very meritorious measure of an union of the parliaments of Great-Britain and Ireland, was accomplished with great practical dexterity by Mr. Pitt. By this grand constitutional innovation, he may be considered as having redeemed his early pledge of parliamentary reform. He has added a hundred members to the British house of commons; he has introduced into our legislation the useful precedent of extinguishing borough-representation by purchase. It will soon be perceived that these changes are realizing, in some degree, the warm expectations, which the friends of parliamentary reform always indulged. The house of commons is become a mightier and a more independent power. To its secret will a greater deference is already shown by the highest branch of the constitution. With the sentiments of the people it sympathizes more than heretofore. Soon no doubt it will break and cast away the rusty chains which superstitious intolerance formerly, and the viler fetters which anti-jacobin intolerance recently imposed on the people of Great-Britain.

This was the last conspicuous act of Mr. Pitt's long administration, which had no very marked character, except while it was overawed by Mr. Burke. It left the country with more positive, with less relative power than at its commencement: with a vast increase of means, and a vast increase of debt. There are no measures, except perhaps the last, of that provident and commanding kind, which bind a statesman to posterity, and forbid the estimate of his utility, before the lapse of centuries. The commercial treaties were such as the age would have made without the agent; they were framed on doctrines already popular; they in nothing anticipated the future principles of statistical philosophy. A spirit of probity, precision, and punctuality, worthy of a banker's clerk, characterized Mr. Pitt's management of the revenue, and his financial intercourse with the monied interest of London. These are scarce qualities among the nobility and gentry, but of the utmost importance in a chancellor of exchequer; indeed it is an office which ought to devolve on the Sir Francis Barings, on the more intelligent merchants of the time, or on the managers

and actuaries of our public companies. Mr. Pitt's respectful attention to all deputations of merchants and tradesmen, does him honor: he always took the pains to make himself master of their grounds of complaint, and usually accommodated his measures, in a great degree, to their representations. This deference for the will of the commercial interest, his somewhat corrupt alliance with the great monopoly companies to the prejudice of unprivileged trade, and the facility with which peerages were scattered among the personal chieftains of the monied aristocracy, have caused that decided popularity upon the Exchange, which still renders the administration of Mr. Pitt an object of sincere regret among the London merchants.

His taxes were numerous. Taxes may be (1) useful: as when they are imposed on those sources of revenue which maintain the idle, and thus compel an increase of productive exertion; such are taxes on the rent or income of houses, lands, fixed and funded property. Taxes may be (2) indifferent: as when they fall on every one in proportion to his ability, and not so sensibly as to inflict privations; such are in a great degree the assessments, yet they somewhat favour the two extreme classes, at the expence of the middle class. Taxes may be (3) noxious: as when they levy on the poor and on the rich an equal sum; such are poll-taxes, and excise-taxes on objects of universal consumption, as beer, tea, soap, candles. Now, it is remarkable, that a very small proportion of Mr. Pitt's taxes belong to the first class, a larger to the second, but the great mass of them to the third of these distributions; so that, as a tax-gatherer, the exertion of his skill is unquestionably blame-worthy. It has not been made out by theorists, whether (4) taxes on circulation, such as on stamps, legacies, conveyances, freight, &c. are useful, indifferent or noxious; we therefore avoid noticing them, as objects of applause or reproach. We suspect, however, that they ought to spare the minor, which are the productive, and to attack the major, which are the unproductive forms of circulation. If so; in this case again, Mr. Pitt has egregiously erred.

As an orator, he ranks in the higher, but not in the highest forms of excellence. If one has a foreign guest, who

wishes to hear the debates in parliament; one picks preferably the evening when Mr. Pitt is expected to speak. There is in his delivery an imposing majesty, in his verbiage an unrelenting fluency, which is sure to satisfy the spectator and hearer: he will return to his own country with an idea that the minister is worthy to represent the nation. Yet if the foreigner happens to be a critic, and to think over and analyze what he has heard, he will probably discover that he was more delighted by the form than by the matter of the harangue. The phrases were turned with the roundness of an author, and accumulated with alluring volubility. Repetition, which is a vice in a writer, is a virtue in a speaker, who can seldom, like Mirabeau, impress at a blow his opinion. The orator, therefore, ought to restate his inferences in altered words, that the sentiment may have time to make its way. Mr. Pitt has eminently this power of amplification; but he accomplishes it rather by a change of phrase than of illustration, rather by multiplying his words than by varying his tropes, rather by dint of memory than of imagination; in the long list of his speeches, there is scarcely a figure one recollects. The argumentative part is never exhaustive, and seldom pointed; but it has always the merit of embracing the leading topics in just proportion, and of pressing those grounds especially, for the comprehension of which the public mind at the time is most prepared.—This is the great secret of popularity and success in public speaking—to argue with the very data of the hearers, to exact no new efforts of thought or reflection from their indolence, and rather to lend expression than idea to them. It is the sure road to the approbation of ordinary minds and common capacities; because it flatters a vanity which instruction would humiliate.—Some persons (the foible is common in the speculative world) are too prospective, too far-sighted in their views and schemes, and consider every question by universal principles and remote contingencies, rather than by its specific pressure and immediate operation. Mr. Pitt, on the contrary, is somewhat too near-sighted, (if the metaphor may be allowed), and is remarkable for the locality and momentaneity, and consequently for the transientness of his grounds of advice. Speeches which

usually seem to win the victory in the newspaper, have already, in the parliamentary register, lost their superiority; and when recorded by the historian have faded into very insufficient defences of his proceedings. Much irrelevant though really active motive was adduced: actual conduct was indeed accounted for; but the idea of perfect conduct should have been evolved and recommended. There is but too much reason to suspect that this narrow mode of arguing is not merely exoteric; but is in fact the faithful and honest transcript of Mr. Pitt's mode of deciding business; for he is commonly found to modify his measures by the criticism of his adversaries, as if their observations were new to him and had not been anticipated.

To have skill in men, to be a judge of merit, is the most important qualification of a prime minister: like the manager of a band of players he should know how to cast every part aright; so as to perform, with the given cotemporary agents, the public business of the nation in the best possible manner.—Either Mr. Pitt wants this skill, or sacrifices, to the pressure of parliamentary solicitation and interest, the pleasure of lifting merit, and the duty of preferring ability. His subordinate appointments have been notoriously injudicious; in short, if his return to office could be borne without impatience, his retirement from it may well be seen without regret.

After conducting his reader to the resignation of Mr. Pitt, our author continues his history to the treaty of peace, of which, in a concluding paragraph, he thus gives his opinion:

“In negotiating a pacification, three objects ought to be kept in view,—*honour, advantage, and security*. That we succeeded in all these desirable points of attainment, none will be so hardy as to affirm. After the frequent boasts of a full determination of acquiring indemnity, the dereliction of the

far greater part of our conquests; and the loss of the effect of a brilliant series of naval triumphs, besides a very oppressive augmentation of the national debt, present a scene remarkably and essentially different from the prospect to which we were taught to look forward. The *honour* of a negotiation does not consist in being dislodged from the commanding posts which the *conductors* of the war affected to occupy and to secure, or in being *successively* driven to the last verge of evasion; nor will such a close of hostility be considered as a material *advantage* by the generality of political speculators; and, in point of *security*, we have less reason to boast of our complete ability of self-defence than we had before the war commenced its mischievous career. Yet the ministers deserve not the severity of censure. They had a difficult task to execute. The unfortunate predicament in which the preceding leaders of the cabinet had involved the nation, rendered peace particularly necessary; and the extraordinary and portentous increase of the power of France, with the high claims of a nation which accused Great-Britain of the guilt of aggression, precluded the hope of favourable or beneficial terms. Viewed with reference to this state of affairs, the treaty of Amiens calls for acquiescence and approbation, rather than disgust, objection, or complaint; and, if it should not be permanent, the fault will be that of the rash statesman whose impolicy promoted by war the extension of Gallic power, not that of the prudent minister whose endeavours were exerted for the restoration of peace. In the mean time, let us not give way to pusillanimity or despondence. Though our security has been diminished, our resources are by no means contemptible. Confining our views to insular defence, we may defy the threatening storm; and, by the terrors of a naval war, we may humble the arrogance of the enemy, and produce a desire of continued peace.”

This convenient volume will, no doubt, find many readers, and will in nothing detract from the reputation of the historian of the union with Ireland. To the Lansdowne politics the author appears most habitually to incline.

ART. V. *History of the Reign of George III. to the Termination of the late War.* By ROBERT BISSET, LL.D. 8vo. 6 vols.

DR. BISSET appears to have seriously, though moderately, imbibed those precisely inverse notions of the duty of allegiance, which Mr. Burke's paradoxical daring thought fit to advance, in order by one excess to counteract what he considered as another.

Mr. Burke holds out the church as entitled to a preference of attachment,

as first, and last, and midst in our minds. He allots the next degree of zeal to majesty, considering it as the key-stone that binds together the well-constructed arch of our constitution. Third in estimation he ranks the house of lords, the chief virtual representative of our aristocracy, the great ground and pillar of security to the landed interest, and that

main link by which it is connected with the law and the crown. As for the house of commons, it is hustled by Mr. Burke among the revolutionary societies, as one of their own family. Thus the institutions which respect our posthumous security, are held up as of most immediate importance; those which chiefly concern our federative and diplomatic intercourse with foreign countries, are ranked next in domestic value; the body which gives force to our courts of justice, stability to our laws, and cohesion to our landed opulence, sinks into a subordinate confederacy; and the great assembly of the united representatives of the people, the source of all legislation, the pledge of voluntary obedience, the nursery of our statesmen, the confidant of our grievances, and the depositary of our hopes, is scarcely made an object of attention.

Mr. Burke suggests an oratorical excuse for what he perceived to be absurd; and plainly intimates that his relative commendation had rather been proportioned to his actual sense of the *danger*, than of the *value*, of the institutions discussed. But here a grave and elaborate historian has adopted these freaks of rhetoric, resorted to for a transient purpose, as permanent rules of appreciation, and canons of historical criticism. Still the bias, though real, is not very prominent.

Bating this perverse and dangerous leaning of opinion, Dr. Bisset's History is highly praiseworthy. It narrates with greater detail and completeness than Macfarlane, Belsham, or Adolphus, the transactions of the present reign. The parliamentary matter is not confined to the political, but embraces the statistical legislation and debates. The influence of literature on public proceeding is not overlooked. The foreign campaigns and continental operations receive their due share of investigation and narrative. The style is natural, yet elegant; the information abundant, yet select; the criticism loyal, yet liberal. In short, it appears to us more likely than any of the rival histories to annex itself to Hume and Smollett, as the regular and generally received continuation of the History of England. One source of popularity in history-writing, is habitually to take part with the constituted authorities, and with the national spirit. Rulers when they have erred, a people when they have erred,

are still grateful to those who become the apologists of their error, and the explainers of their decision: this art of ingratiating is much practised by Dr. Bisset. He is commonly the panegyrist of event, the preconizer of destiny; he rows with the stream; he fans in its own direction the gale of public opinion; and turns away from the cotemporary scene, like Augustus, with a request to the spectators to applaud. He is the reverse of a discontented historian, but is candid even to the factious.

A preliminary dissertation rapidly sketches the state of party and events prior to the war of 1756. The first chapter continues this preparatory matter in greater detail to the accession of George the third. The first volume extends to the dissolution of the parliament in 1767. It deserves notice, that when the affairs of the India company came before this parliament, in November 1766, Lord Chatham denied the right of the company to have territorial possessions, as such were not conveyed by their charters, and were foreign to the nature and object of a trading company; and he maintained that Government, for its great expence in the protection of that company, was entitled to the territorial revenue of Hindostan, for the purpose of indemnification. These observations apparently inspired the scheme of that India bill, which Burke and Fox produced sixteen years afterwards.

In the second volume (at p. 45) there is a diverting misprint. Junius is described as accusing Lord Mansfield of *jacobinism*.

The first political symptoms of a religious heterodoxy, now so much extended, are thus noticed by Dr. Bisset.

"Sir Henry Houghton made a motion to relieve the dissenters from subscriptions and the penal laws, but was warmly opposed by the high-church gentlemen. The dissenters, it was said, by omitting to subscribe, had violated the law of the land; and the transgressors, not satisfied with being excused, desired the law to be changed in order to accommodate a change in their opinions. A total exemption from subscription would open the way to heresy and infidelity. The dissenters were a respectable body, and a certain regard was due to their opinions; but the present bill, instead of proposing the mere relief of non-conformists, was a project for encouraging schism, and ultimately destroying the church of England; many of

the dissenters now maintained doctrines totally different from those of former times, and were inimical to the church of England, to the protestant religion, and to true christianity: to encourage such men, therefore, would be equally contradictory to sound policy, and to the interests of the established faith. The supporters of the bill contended, that subscriptions, while they operate against the pious and conscientious, are no restraints on the impious and wicked. The sectarians were charged with having deviated from the theological opinions of their predecessors; but in all ranks of a community advancing in knowledge and civilization, the more understandings were exercised, the greater would be the diversity in the result of different efforts. That some individual dissenters held principles inimical to christianity, might be true; but the charge against them as a body, was totally false: they had been uniformly the friends of civil and religious liberty, had supported the British constitution, the establishment of the house of Brunswick, and all those principles and measures by which our constitutional rights were upheld: they had moreover supported the christian faith against its most ardent impugnors; and such men certainly deserved to enjoy something more than mere impunity by connivance. By toleration, christianity had flourished; by intolerance, the number of believers had been lessened: let protestants be united, that we may be the better able to make head against infidels. These considerations induced a great majority in the house of commons to vote for the bill; but in the house of lords the bishops exerted themselves so strenuously against an indulgence which they conceived and represented to be dangerous to the church, that the bill was rejected by no less than a hundred and two to twenty-nine."

A far more desirable measure than those which have hitherto been agitated, would be the repeal of the act of uniformity. It would at once admit the catholics of Ireland, and the unitarians of England, to that participation in the establishment to which the diffusion of their opinions and the weight of their

property has long entitled them. A division of the clergy into distinct sects would somewhat lessen the mischievous cohesion of that body corporate, now so subservient, not merely to the mandates of government, but to the personal caprice of the crown. But this cohesion might be further diminished by vesting in the clergy of the diocese the nomination of their own bishop; and by converting the prebendal stalls, which are wholly useless in the hierarchy, into lay preferments, distributable among the decayed authors and artists, to whom national gratitude owes some provision.

There is a short passage in this volume which, with its connected note, we shall also present to our readers, as it obscurely touches a constitutional disease of long standing and felt peril.

"Ever since the debate on the address, great indecision had appeared in the conduct of the minister. He studiously avoided any farther discussion on American politics, and frequently absented himself from the house. From these circumstances it was conjectured, that he did not fully concur in the coercive system; and this hypothesis was by no means inconsistent with either his known disposition or abilities. It was presumed, that a man of such a conciliating temper, and whose first ministerial act had been concession to appease the colonists, could really be no friend to violent and irritating measures; and that a statesman of his undoubted talents could not, from the dictates of his own understanding, devise or recommend such acts. Lord North, it was imagined, could not long be so completely deceived as to fact, and erroneous in argument, as the proposers of the ministerial measures appeared. Besides, it was supposed that his intellect was too enlightened, and his mind too liberal, to possess that contemptible obstinacy of character which is incident to men at the same time weak and vain, who adhere to a plan, not because it is proved to be right, but because they had once favoured its adoption\*.

"\* It has been very often asserted, and by many believed, that lord North originally was, and always continued in his private sentiments, inimical to the American war; although he, as prime minister, in every measure of carrying it on, incurred the chief responsibility. This opinion, as an historian, I have not documents either to confirm or refute with undoubted certainty. To those who would confine themselves to comparison of the plans and conduct of government during that awful period, with the talents often displayed by his lordship, the conjecture may appear probable. But persons who take a candid view of the respectable and estimable moral qualities of the prime minister, will hesitate in justifying his wisdom at the expence of his integrity; they will sooner admit that a man of genius, literature, and political knowledge, reasoned falsely and acted unwisely, than that a man of moral rectitude acted in deliberate and lasting opposition to his conscience, thereby involving his country in misfortune. At the same time, I am fully aware that there is a third hypothesis possible, and by many believed, if not by some known to be true. The opinion in question rather changes the situation than degrades the character of lord North,

"The theory of an interior cabinet was revived; and it was asserted, that lord North, though ostensibly minister, was really compelled to obey the dictates of a secret junto. Having, however, no satisfactory evidence that such a cabal existed, nor that an able and estimable nobleman submitted to such a disgraceful manipulation, I cannot record conjecture as a historical truth, and must narrate the measures proposed or adopted by lord North as his own; because for them he declared himself responsible."

The third volume opens with the parliamentary session of 1777; when the hostile interference of France in behalf of American independence began to be apprehended. A fine piece of narrative is the final appearance of Lord Chatham in the house of peers, on the duke of Richmond's motion upon the state of the nation.

"His lordship had that session frequently attended the house of peers, less from the relaxation of distemper than from the calls of duty, which the increasing calamities of his country made him consider as every day more imperious. In a bodily state fitted only for the stillness and quiet of a bed of sickness, he encountered the active warfare of the senate, hoping his counsels might at length be admitted by those who were experiencing such evils from former rejection and intractability, and that, in his old age, he might contribute to restore part of the prosperity, greatness, and glory, which he had acquired for his country in the vigour of his life, and which left her when he ceased to guide her affairs. His exertion, in the former part of the session, so much beyond his bodily strength, had increased his distemper; but, informed of the business that was to be agitated, and aware of the doctrines which would be brought forward, he thought it incumbent on himself to render it manifest to the world, that though he agreed with the marquis of Rockingham and his adherents in reprobating the system of ministry, he totally differed from them on the question of American independence. He accordingly betook himself to the senate, of

which, for near half a century, he had been the brightest luminary. Having arrived in the house, he refreshed himself in the lord chancellor's room, until he learned that business was about to begin. The infirm statesman was led into the house of peers, attended by his son-in-law, lord Mahon, and resting on the arm of his second son, Mr. William Pitt. He was richly dressed in a superb suit of black velvet, with a full wig, and covered up to the knees in flannel. He was pale and emaciated, but the darting quickness, force, and animation of his eyes, and the expression of his whole countenance, shewed that his mind retained its primeval perspicacity, brilliancy, and strength. The lords stood up, and made a lane for him to pass through to the bench of the earls, and with the gracefulness of deportment for which he was so eminently distinguished, he bowed to them as he proceeded. Having taken his seat, he listened with the most profound attention to the speech of the duke of Richmond. When his grace had finished, lord Chatham rose; he lamented that, at so important a crisis, his bodily infirmities had interfered so often with his regular attendance on his duty in parliament. 'I have this day (said he) made an effort beyond the powers of my constitution, to come down to the house, perhaps the last time I shall enter its walls, to express my indignation against the proposition of yielding the sovereignty of America. My lord, I rejoice that the grave has not closed upon me, that I am still alive to lift up my voice against the dismemberment of this ancient and noble monarchy. Pressed down as I am by the load of infirmity, I am little able to assist my country in this most perilous conjuncture; but, my lords, while I have sense and memory, I never will consent to tarnish the lustre of this nation by an ignominious surrender of its rights and fairest possessions. Shall a people so lately the terror of the world, now fall prostrate before the house of Bourbon? It is impossible. I am not, I confess, well informed of the resources of this kingdom: but I trust it has still sufficient to maintain its just rights, though I know them not; and any state, my lords, is better than despair. Let us at least make

by representing him as merely his majesty's first commissioner of the treasury and chancellor of the exchequer, instead of the prime political counsellor. Persons of very considerable respectability, of very high veneration for the character of lord North, and who with inviolable fidelity adhered to him in every vicissitude of fortune, have given their opinion, that he was not really minister, but the official executor of positive commands. I am aware also, that in this assertion they are said to proceed, not merely on general inferences, but on specific evidence. From the nature of the alleged documents, I know well that if they exist, they cannot at present be made public. If the truth of this account were established, we should, indeed, have to consider his lordship as officially obeying orders, but not as voluntarily proposing counsels: this, perhaps, might excuse him as the servant of a master, but would not be sufficient to acquit him as member of a deliberate assembly. Even in this last view, palliations might be found to apologize to the indulgent, though it would be more difficult to discover facts and arguments which would satisfy the rigidly just."

one effort; and, if we must fall, let us fall like men."

"The Duke of Richmond declared his grief and horror at the dismemberment of the empire to be as great as that of any man in the house or nation, but how was it to be avoided? he himself was totally ignorant of the means of resisting with success the combination of America with France and Spain. He did not know how to preserve the dependence of America. If any person could prevent such an evil, Lord Chatham was the man; but what were the means that great statesmen would propose? Lord Chatham, agitated by this appeal, made an eager effort at its conclusion to rise; but before he could utter a word, pressing his hand to his heart, he fell down in a convulsive fit. The Duke of Cumberland and Lord Temple, who were nearest to him, caught him in their arms. The house was immediately in commotion, strangers were ordered to depart, and the house was adjourned. Lord Chatham being carried into an adjoining apartment, medical assistance soon arrived. Recovering in some degree, he was conveyed in a litter to his villa at Hayes in Kent, and there he lingered till the 11th of May, when he breathed his last, in the 70th year of his age."

The coalition between North and Fox is discussed and blamed by Dr. Bisset, very consistently with his disposition to preserve the influence of the crown from being overpowered. But the people ought never to forget that all coalitions, not suggested by the sovereign, are necessarily bottomed on the principle of a parliamentary dictation of ministers being preferable to their selection by the personal will of the king. This is a somewhat republican, though not at all a democratic, principle: it does not threaten any change in the form of the constitution; but it tends clearly to transfer a portion of real and efficient power from the crown to the house of commons, from an hereditary to an elective branch of the constitution. The prejudice of friends of liberty ought to be in favour of coalitions: the choice of ministers too ought to rest in the house of commons; for the delegates of the people have more assuredly, in their collective capacity, the wisdom requisite to appoint ministers skilfully, than any one man is likely to have, whom neither native or acquired ability has rendered conspicuous as a judge of merit; and they have more assuredly a common interest with the nation, than any particular reigning dynasty, whose continental and domestic interest may

both differ occasionally from those of the country.

The fifth volume opens with an account of the revolution of France. It is yet too soon to appeal to experience, for a decision concerning the utility of this formidable change. Many great and permanent benefits were conferred by the legislation of the constituting assembly. A military despotism has terminated, for the present, the hope of a rational and enduring liberty. But it is by no means improbable that the sway of the new Cromwell will be superseded by institutions more popular, and that the national assemblies of France will be found to have conferred the same benefits which the long parliament of England bestowed on this country: benefits far superior to the more valued innovations of any subsequent revolution. The French suffered not from their legalized representation, but from that Parisian faction which superseded representative authority, and introduced the direct sway of a democratic oligarchy; by appealing from the delegates of the people to the people in their individual capacity, in the form of ignorant assemblages or factious clubs. Not to republicanism, but to ochlocracy, they owe their greatest evils.

In this volume the forty-sixth chapter narrates the discussion of the abolition of the slave-trade. Here Dr. Bisset leans to the cold and puny policy adopted by the country. What is now to be expected from it, but that a legislature, which, instead of considering the happiness of its subjects as the binding principle of its policy, has preferred to consult the harsh wishes of an aristocracy of tropical land-owners, will be repaid with an ingratitude not more disgusting than its conduct, and will find its authority disputed by the very men to whom it lent the aid of its power, beyond the limits of its sense of justice.

The writings of Paine, the riots of Birmingham, come under examination. These tumultuous excesses, Dr. Bisset complains, were ascribed by Dr. Priestley to the badness of the cause: *as if the intrinsic merits of any system could be lessened by the folly or madness of its defenders.* There is an incorrectness in stating (p. 403) that Robespierre and his supporters abjured the Supreme Being: the reverse is the case. Other flaws occur in the narrative, which to

the history of English affairs are equally unimportant.

In proportion as the narrative approaches our own times, it becomes liable to the suspicion of a partiality not resulting merely from a cast of opinion, which it is always the right of an historian to acknowledge. In the campaign of 1794, which the Duke of York waged, there are symptoms of this kind.

At the beginning of the sixth and last volume it is said, that the Jacobins triumphed over the Girondists. We have always understood that the Girondists triumphed by the means of the Jacobins; and that the Cordeliers triumphed over the Jacobins, and brought the Girondists to the block. The Cordeliers were the regicide portion of the Jacobins.

In detailing the progress of rebellion in Ireland, it is said that the professed objects were reform in Parliament and Catholic emancipation; but that the real objects (p. 203) was separation, and independence.

“To promote the changes which they desired, certain persons formed a society to which they gave the name of United Irishmen. This institution, projected and organized by Wolfe Tone, proposed to connect the whole Irish nation together, with the professed purpose of a general melioration of their condition, by a reform of parliament, and an equalization of catholic with protestant privileges, without any exceptions civil or political. The plan of union was formed on unity of object, connection of instruments, and a co-operation of means, that combined secrecy of proceeding with efficacy of counsel and conduct. No meeting was to consist of more than twelve persons; five of these meetings were represented by five members in

a committee, vested with the management of all their affairs: from each of these committees, which were styled, “baronial,” a deputy attended in a superior committee, that presided over all those of the barony or district. One or two deputies from each of these superior committees, composed one of the whole county, and two or three from every county committee composed a provincial committee. The provincial committees chose in their turn five persons to superintend the whole business of the union: they were elected by ballot, and only known to the secretaries of the provincial committees, who are officially the scrutineers. Thus, though their power was great, their agency was invisible, and they were obeyed without being seen or known. Whether the designs of these associates were originally to effect a complete separation of Ireland from Britain has not been ascertained as a fact; but there is no doubt that, in the progress of their concert, they had formed such a project; and that parliamentary change, and catholic emancipation, were only pretexts with the heads and principal agents of this confederacy, in order to unite the greater numbers in the execution of their designs.”

Surely these objects grew out of the difficulty, and but for the obstinate hostility of Great Britain to just ends, would never have been entertained. The recall of Earl Fitzwilliam is hurried over: we should have been glad to know on what grounds the Burkites, who profess hostility to an interior or double cabinet, and who willingly talk of ministerial responsibility, can justify their continuing in office after that recall. By Mr. Burke's letter to Sir Hercules Langrishe, they were pledged to promote a redress of the Catholic grievance: but their anxiety about it only revived, when they had ceased to be employed in withholding it.

ART VI. *History of the Insurrection of the County of Wexford in 1798, including an Account of Transactions preceding that Event: with an Appendix.* By EDWARD HAY, Esq. M. R. I. A. 8vo. pp. 404.

It may be doubted whether religious toleration will ever be practically realized in a community, of which the majority is agreed in religious opinion. All ecclesiastical history is a record of some one sect tyrannizing over some other sect: but if a community were subdivided into so many different sects, that the coalition of the rest would always be more powerful than any one, even the most popular; then, and only then, toleration would be always the common interest of them all. Perhaps, therefore, men of authority, who desire to patronize a pure and uninterrupted

religious liberty, and to perpetuate the political equality of religious sects, ought always to secede from the religion of the majority; and thus reduce within the expedient degree of weakness, the dangerous ascendancy of the most popular sect. Some grounds of objection or variation will always present themselves to an inquisitive mind; and these should be exalted into importance against the domineering persuasion.

The catholics of Ireland form, in our apprehension, too numerous a party for the interests of tolerance; if the nation was to become autonomous, and to ap-

point its political magistracy at home. But whatever we may suspect of the catholics, we know of the protestants; and have witnessed a religious persecution, which it is neither correct nor useful to disguise under the dress of political party.

Of the accomplished author of this work it will be best to speak in his own words. He thus accounts in the introduction for his interference in Irish affairs.

“Very serious disturbances took place in a part of the county of Wexford, in the month of June 1793; but they were soon suppressed by the exertions of the country gentlemen, who formed ‘an association for the preservation of the peace.’ I constantly attended their meetings, and I believe it will be allowed, that my conduct and endeavours proved as effectual as that of any other to restore public tranquillity.

“In January 1795, while lord Fitz-William was viceroy, I procured a great number of signatures, to a petition to parliament, from the catholics of the county of Wexford, and in the same month I was one of those that presented an address from them to his excellency. When his lordship’s recall was announced from the government of Ireland, a meeting of the freeholders and other inhabitants of the county of Wexford was convened on the 23d of March of the same year, when a petition to his majesty was unanimously agreed to, and I was appointed one of the delegates to present it to the king. I had been as far as Dublin to take ship for England, when it was thought advisable to have the petition subscribed by as many persons as possible, and while my brother delegates proceeded to London, I returned to the county of Wexford, and considering that I was the chosen delegate of protestants as well as of catholics, I took the precaution of consulting the principal protestant gentlemen of the county first, to prevent the possibility of misrepresentation, or of denominating my pursuit the business of party; and I was so successful as to procure in the space of one week, 22,251 signatures to the petition; with which I then proceeded to London, and had the honour to present it, along with my brother delegates, to his majesty, at a public levee at St. James’s, on the 22d of April 1795; and we met a most gracious reception.

“Different motives of private concern induced me to resolve to quit Ireland, in the year 1797, and to go to reside in America, and this I purposed to do as soon as the regulation of my affairs would permit me. I was mostly in the county of Wexford in the latter end of 1797, and beginning of 1798; but my attendance in Dublin was sometimes necessary upon law business, which I at length flattered myself I had finally got rid of by com-

promise. In the latter end of April, therefore, I took leave of my friends, as my proposed short stay in Ireland would not allow me the opportunity of seeing them again; as I had determined to go immediately to England, and from thence to America. In this project I was most unhappily disappointed, as a part of the compromise, which was, that my furniture should be taken at a valuation, was not complied with; and I was therefore reluctantly obliged to remain in the country, until I could, as I thought, dispose of them by auction, which I advertised would take place on Monday the 28th of May. I am thus particular, to counteract the malevolent insinuations of my enemies, and as it was this disappointment that occasioned my detention in the county of Wexford until the commencement of the disturbances; by which I lost all my furniture, and all else that could be taken from me, except what I had on my back, and about my person. Had I any possible intimation of the calamities that ensued, I most undoubtedly would have preferred settling my property even at a loss, and securing the value, to waiting to be detained against my will in that unfortunate country; and I would thus have escaped enduring those sufferings and persecutions that afterward fell to my lot.

“My conduct during the insurrection, as far as it is necessary to be known, properly belongs to the history of the times; and so I shall proceed to a relation of my persecution and sufferings.

“Lord Kingsborough and his officers conceived themselves under such obligations to me, that at their entreaty I lived in the same house with them, from the surrender of the town until the 29th of June, when they departed for Waterford. My former intention of going to America, was by no means lessened but augmented, by the scenes of which I had so recently been witness to in my native country. I accordingly persisted in my resolution, and was determined to get out of the country as speedily as possible. The committee that had been appointed by lieutenant general Lake, to act as a kind of council to general Hunter, then in command in Wexford, and to grant passes, now began to practise their malicious arts against me, which they avoided before, being apprehensive, if not well aware, that their schemes would be counteracted and defeated, if attempted to be put in execution, while the officers, who were acquainted with my conduct, remained in Wexford. I received a note from the chairman of this committee, (and it was delivered to me by one of the body, whom I then considered as my friend) desiring I would write to him, stating what I would wish to be done, and that my request would be taken into immediate consideration. This induced me to write to them, intimating the desire, I had so often expressed, of going

to America, adding, that I wished to set off the next day, in order to sail in a ship then in the harbour of Dublin; and this determination I would, in all probability, have since put in execution, but that I considered it might have given free sanction to the calumnies so industriously raised against me. This consideration has detained me in Ireland, as here I was the better enabled to vindicate my honour, and this, indeed, my persecutors have completely effected, quite in contradiction to their inclinations and wishes. The immediate consideration of the committee was, in consequence of premeditation, to send back the gentleman, who brought me the note and took my answer, to arrest me. This he did at my lodgings, where I was publicly known to be since the insurrection, and two yeomen were there placed as a guard over me. This whole conduct, from several circumstances of which I have since come to the knowledge, was certainly preconcerted. Had I been sent to gaol, it would have been productive of a trial by court-martial, and this was a benefit which they did not wish to allow me, as they were well aware of the sentiments of the officers, whom I would have summoned back to Wexford; besides, some individuals among them were most ungratefully induced to forward the vile proceedings against me, as they were apprehensive I might call on them as witnesses, when their loyalty may have been called in question, were they to do justice to my conduct; and it may also have been manifested, that whatever honour some of them now possess, is owing to their taking my advice in preference to their own; as, if they escaped piking on the one side, they may have been hanged on the other, and with much more justice than several who have forfeited their lives on the occasion. To transport me without further enquiry, was therefore considered more advisable. Several, who had been tried and sentenced to transportation, were taken on the 3d of July from the gaol, and put on board a sloop which had been twice condemned during the insurrection, and which had sunk within a foot of her deck, and was only pumped out that morning. Afterward a guard was sent to my lodgings, and I was marched down to the custom-house-quay, in the most conspicuous manner, and put on board this horrid hulk, without any trial or further investigation!!!

"In consequence of the opinion of a most eminent physician in Dublin, that it would be more humane to order me to be shot, than to leave me in such a situation, being made known to general Lake, through general (now sir John) Craddock, he sent down orders to enquire more particularly into the state of my case; and general Hunter accordingly sent doctor Jacob to visit me. The result was, that after five weeks confinement, in such a mansion of wretchedness, I was removed to the gaol; but my health

had become so impaired, that I much fear it may never be perfectly re-established.

"At last my long-wished-for trial came forward, on Thursday the 27th of July, and although I was advised that I might have availed myself of the defectiveness of the indictment in point of form, and although I might also have protected myself by the amnesty act, if necessary, yet I disdained to adopt such subtleties, and declared myself ready to meet the whole of the charges against me. Two only, out of the four witnesses, named to me, were brought forward; but their cross-examination completely did away any thing injurious that could be inferred from their direct testimony. One of these was William Carty, the informer, who afterward pleaded guilty to an indictment for murder, was condemned to death, which sentence, in consideration of his services, was commuted for transportation to Botany-bay; and although half what he had sworn was false, and invented to criminate me, yet in the event it turned out so much to my honour, that my counsel thought it not necessary to impeach his credit, which I was well prepared to do, he being the principal evidence for the crown. Although it be obvious to infer, that furnishing me with a list of the witnesses, was a palpable consent to produce no others against me but those named therein, yet, on the disappointment of the failure in the evidence of the two first, other witnesses, not named in the list, with which I was furnished, were produced; and the most material of them was sworn of the jury then trying me; and to him I certainly would have objected, had I not been thrown off my guard by the trick practised for that purpose. I was therefore totally unprepared to rebut or explain any evidence he might offer, as, on receiving the list, I had sent off witnesses whose testimony would have particularly borne upon any thing he could allege. I must however excuse counsellor O'Driscoll, the leading counsel for the crown, from having any concern in this vile transaction, as he most honourably declared, that he was astonished I had not been furnished with this man's name, as the purport of his evidence was set forth in his brief, which he held up and pointed to; however, he said duty obliged him to insist upon his being examined, for that although it was the privilege of prisoners accused of high treason in England, that no other witnesses but those named in the lists furnished, should be produced against them, yet the law did not entitle them to such an indulgence in Ireland. Notwithstanding all these disadvantages, I was honourably acquitted. Baron Smith declared in his charge, that I had undergone the most virulent persecution, that my loyalty was unimpeachable, and that if the jury attempted to find me guilty, as some juries had acted contrary to law and justice at those assizes in Wexford, I might take advantage of the amnesty bill, by mov-

ing arrest of judgment, and that I should be instantly discharged, so that they might as well give me at once the acquittal I deserved."

Such usage may be expected to embitter: yet the statements which ensue have an impression of candour, temper, accuracy, and veracity, which cannot fail to obtain implicit confidence. The whole narrative is circumstantial, interesting, and horrible in the highest degree: it agitates and impassions like a novel. We could wish, for the honour of our country, and for the reputation of its government, that it were possible to draw a veil over events and transactions, which are disgraceful to human nature by the number of pitiless individuals they imply, and to social order by the display of an undisciplined uncivilized rabble of savages, which it has so long neglected, or vainly tried, to tame. How deep a wound will such particulars inflict on the paternal heart of a sovereign, who has to regret an opportunity of preventing these outrages. By a too scrupulous delay of the solicited redress, he furnished his enemies with a pretext for embittering discontent into rebellion. Had every danger been realized, which the most frantic fancy could hold out as the possible consequence of catholic emancipation, still the evil would not have approached in magnitude that which has already resulted from the refusal. It would be worthy of the independence and humanity of the church of England, to signify by a deputation of its bishops to Majesty, that it prefers the risk of heresy to the reproach of persecution. On the conduct of the roman catholic clergy, Mr. Hay thus speaks:

"While I am on the subject of the rev. Michael Murphy's death, I must beg leave to express the opinion I have adopted, in conjunction with the most sensible and rational men that I have conversed with on the subject, respecting the priests who were active in the insurrection.—When clergymen so far forget their duty as to take up arms, so contrary to the spirit of the gospel, they become most dangerous men; and the sooner such are cut off by any fatal catastrophe, the better. The duty of a clergyman is to preach peace and charity towards all mankind: when his conduct deviates from this, he acts inconsistent with the profession he has entered into. Why throw off the meek garb of peace for the horrid habiliments of war?—Under no possible circumstances ought a clergyman to be instrumental to the death of

any person, except in the most urgent necessity of self-defence:—whenever else he takes up arms, he becomes a traitor to the gospel of Christ; and although treason may, on particular occasions, be considered useful, yet a traitor to any cause never can be regarded; even by those for whom he exerts himself. Besides, the interference of clergymen encouraging any kind of strife, but particularly warfare, must be considered highly culpable, and deserving of a fatal end. Not one of the priests who took up arms in the county of Wexford, escaped a violent and sudden death, clearly indicating a providential fate; and although they were not all, at the time, under suspension or ecclesiastical censure, yet under one so nearly allied to it, as to prevent any of them from having arrived to the situation of a parish priest. It is but common justice that those alone should bear the disgrace of reprobation who actually deserved it, and that the great body of the catholic clergy should be rescued from censure, as they were free from blame. The misconduct of a few individuals should not involve the good character of the many, and it must be recollected that, even among the twelve apostles, there was a traitor. The conduct of the roman catholic clergy of the county of Wexford, however unjustly reviled, was, during the insurrection there, guided by the true dictates and principles of christianity, really exemplary and meritorious. They comforted the afflicted with all the zeal and warmth of christian charity, and in the most trying and critical period, practised every deed that must be considered benevolent, by every liberal and enlightened man, whatever brawlers of loyalty may assert to the contrary; endeavouring, with indiscriminating abuse, to brand their conduct in general with the stain of infamy. They, by every possible means, sought to afford every assistance and protection in their power, to those who stood in need of it; but their influence was greatly diminished by not following the example of the militant priests, who strove to attain an elevation and superiority over their brethren in this way, which they could not otherwise accomplish. If I may be allowed the expression, the conduct of the fighting priests was truly amphibious. For while they cast off the character of priests, and took up that of soldiers, they still wished to maintain an ascendancy, even in their new stations, by reassuming the priest whenever it answered the purpose of superiority, the passion for which was greatly augmented by indulgence in drinking; and notwithstanding all this, they were conspicuous for courage and humanity."

When will all the votaries of christianity cease to confound the son of Mary with the child of Ismael, and to employ, instead of the mild persuasive eloquence of their master, the sword of Mahomet?

The co-establishment of all sects is an easy process; and would silently, naturally, and without injuring any individual, result from a mere repeal of the act of uniformity. It is time that,

laying aside the spirit of dissension, all sects should aspire to melt into one catholic church, and begin a warmer competition of benevolence and a higher industry of usefulness.

ART. VII. *An Historical Review of the State of Ireland, from the Invasion of that Country under Henry II. to its Union with Great Britain.* By FRANCIS PLOWDEN, Esq. 2 vols. 4to. pp. abt. 2350.

THE antiquities of Ireland have oftener been commented by credulous than by judicious antiquaries: yet the testimonials adduced from chronicle and from language, favour the hypothesis of a Phœnician or Carthaginian colonization, having supplied the main body of the early population. It is said that the red hair, so common in Scotland, results from a mixture of the Iberian and Gothic races; and that its scarcity among the native Irish is a proof of the superior purity of their descent. Whether the first settlers came directly from the Mediterranean, or mediately from Spain and Portugal, cannot absolutely be ascertained; but as tradition and geography favour the latter opinion, it may rationally be acquiesced in.

The state of Ireland, prior to the mission of Saint Patrick, no doubt resembled that of Cornwall and Britany.—Like these provinces, it nearly escaped the barbarizing intrusion of Roman armies, and preserved something of that antient civilization, which from these provinces overspread the north, and founded the spirit of modern Europe. The first traces of heraldry occur in the chronicles of the Irish.

“The grand epoch of political eminence,” says Mr. Plowden, “in the early history of the Irish, is the reign of their great and favourite monarch Ollam-Fodlah, who reigned, according to Keating, about 950 years before the Christian æra. Under him was instituted the great Fes at Teamor or Tarah, which was in fact a triennial convention of the states, or a parliament, the members of which consisted of the Druids and other learned men, who represented the people in that assembly. Thus the monarch and the provincial and other kings, who had the executive power in their hands on one side, and the philosophers and priests, together with the deputies of the people, on the other, formed the whole of this antient legislature. When this great council was convened, previous to their entering upon business, they sat down to sumptuous entertainments for six days successively. Very minute accounts are given by the Irish annalists of the magnificence and order of these entertainments;

from whence we may collect the earliest traces of heraldry that occur in history, and deduce that partiality for family distinctions, which to this day forms a striking part of the Irish national characteristic. In order to preserve order and regularity in the great number and variety of the members who met together on these occasions, when the banquet was ready to be served up, the shield-bearers of the princes and other members of the convention delivered in their shields and targets, which were readily distinguished by the coats of arms emblazoned upon them: these were arranged by the grand marshal and principal herald, and hung upon the walls on the right side of the tables, and upon entering the apartments each member took his seat under his respective shield or target without the slightest disturbance. The first six days were spent not in disorderly revelling and excess, but particularly devoted to the examination and settlement of the historical antiquities and annals of the kingdom: they were publicly rehearsed and privately inspected by a select committee of the most learned members. When they had passed the approbation of the assembly, they were transcribed into the authentic chronicle of the nation, which was called the register or psalter of Tarah. This singular caution to prevent the introduction of any falsity or misrepresentation into their national history, would have furnished posterity with the most authentic and interesting relations of this ancient and extraordinary kingdom, had not the Danes in their frequent ravages and invasions of Ireland, during the 9th and 10th centuries, burnt all the books and monuments of antiquity that fell in their way. We have still more to lament the shameful and fatal policy of our ancestors, who, from the first invasion of Henry Plantagenet down to the reign of James the First, took all possible means of art and force to destroy whatever writings had by chance or care been preserved from the destructive hands of the Danes. They imagined, that the perusal of such works kept alive the spirit of the natives, and kindled them to rebellion, by reminding them of the power, independency, and prowess of their ancestors. The public mind upon this subject has long been changed: two centuries have gone by, since Sir John Davis said, that ‘had this people been granted the benefit of the English laws, it would go infinitely farther towards securing their obedience, than the destruction of all the

books and laws ever published in this kingdom.' We have happily lived to see a legislative union of the two countries, which will, it is trusted, by the natural workings of the British constitution, go further in three years towards the destruction of national prejudice and disaffection, than a mere communication of laws did in three centuries."

The evidence on which these marvellous narratives repose, ought carefully to be collected and published, after the manner of the *Myvyrian Archaiology* of Wales. It is not unlikely that historical criticism may be able to separate much valuable unreceived truth, when it has bolted to the bran the Milesian tales, the druidical rimes, the monkish legends, the metrical romances, and the prose chronicles of the Irish. On these subjects Mr. Plowden plainly exercises little severity of research, and seems rather to aim at flattering the national vanity of the western islanders, by eagerness of credulity, than at enlarging the bounds of their historic horizon.

But in proportion as this narrative approaches the period at which the connection with England began, it rises in critical value and judicious selection. It is in fact the international history of Great-Britain and Ireland until their union. Henry II. was invited to Ireland by Dermot, a king of Leinster, who, having seduced and detained the wife of a king of Breffny, was on the point of being punished by a confederacy of the native princes. Earl Richard Strongbow was sent to the assistance of Dermot: a bull was obtained from Pope Adrian, granting the island to Henry; and some colonial settlements were made, chiefly in Leinster and Munster, by the Bristowians, who accompanied Strongbow. The commercial habits of many of these settlers favoured their advantageous establishment; and as a cotemporary progress was made by the military allies of Dermot, the English interest acquired, step by step, a considerable extent of jurisdiction, comprising at length the counties of Dublin, Kildare, Meath, and Uriel, and became very obnoxious to the ancient inhabitants, who were denominated by the intruders, Irish *without the pale*.

The Irish *within the pale*, from their primitive connection with England, and the intermixture with English, fell under a government similar to that of the

British nation. The country was divided into districts, and committed to the care of sheriffs. Courts of justice were established, analogous to those at Westminster. And finally, a parliament was convened occasionally by the governor. Sir John Davies thinks these Irish parliaments did not precede the reign of Edward II. Leland is for dating their commencement under Henry II. The oldest parliament-rolls which are extant bear date the 40th year of Edward III. when the statutes of Kilkenny were enacted. These statutes most unnaturally prohibit alliance by marriage between the English and Irish, as well as putting out children to be nursed in Irish families. This is worse than political, worse than religious intolerance: it is a conspiracy against the charities of the heart, and a prohibition of the affections of nature; but it was not likely to oppress many individuals, because those Pyramus-and-Thisbe attachments, between enemies, are not of frequent occurrence. A more diffusive grievance was the extortion of *coygne and livery* from the people; that is, of *man's meat, horse-meat, and money*, from all housekeepers indiscriminately, for the use of the troops. This form of oppression has lately been repeated under the name of *free quarters*. These various injustices are stated by Mr. Plowden to have endured, without intermission, under the reigns of sixteen monarchs, from Henry II. to Henry VIII.

The accession of Henry VII. however, as it restored peace and tranquillity to England, so it enabled the sovereign to plan and execute more effectual measures for the administration of his Irish dominions. It ought, therefore, not to have escaped a more attentive notice at the conclusion of the first part of this history. Two objects appear to have been immediately in the view of the crown: to extend a regular policy over the country, and to render the Irish government subordinate to that of Britain.

To promote the former of these purposes, under the direction of Sir Edward Poynings, the lord-deputy, it was provided by an act of the Irish parliament, that all the statutes lately made in England of a public nature, should be held valid in Ireland. This adoption of English laws by the Irish parliament was not unprecedented, as another instance of it occurs in the reign of

Edward IV. From this regulation, which conferred an important benefit, while it tended to prepare an union, it may fairly be presumed that the Irish parliament was then understood to possess an independent legislative authority.

To secure the dependence of the Irish parliament on the British crown, Henry endeavoured to acquire a negative before debate, a veto against their proceedings. For this purpose, he procured from that assembly a regulation, that no parliament should be held in Ireland, until the lord-deputy and his council should certify to the king and his council in England, the causes for which the meeting was to be called, and the bills which were therein to be enacted; and that, unless the king's leave was previously obtained, the transactions of any future parliament should be void in law.

These regulations were frustrated in the reign of Henry VIII. by the power of the Earl of Kildare, who, uniting the office of lord-deputy with great personal power in the country, conducted himself in a manner contrary to the laws, and independently of the wishes of the English. Cardinal Wolsey ordered him to England: he was there committed to the tower. His son, lord Thomas Fitzgerald, who acted in his father's absence as lord-deputy, immediately raised the standard of rebellion. Treacherous and cruel measures were resorted to for its suppression: the Irish nation was irrecoverably disgusted, and when the reformation of religion took place in England, the religious and political passions of the Irish nation were predisposed by animosity to become inflamed against its reception.

Under the catholic sway of Mary, some approximation was made to the policy of Henry VII. It was required not only that the acts in contemplation at the meeting of an Irish parliament, but that those proposed after its assembling, should be certified to the king and council in England; and that they might not be put to vote, unless sanctioned by this preliminary approval. The friends of Irish independence eluded this regulation, by deliberating whether a proposal for a given bill should be certified to the king and council, which answered the purpose of exciting public attention, and of proclaiming their individual sentiments and arguments.

The protestant reign of Elizabeth produced no less than three rebellions in Ireland, which may be attributed chiefly to the state of religious opinions.

By the union of the English and Scottish crowns in the person of James I., by the cordial acquiescence of the whole nation in the title of their new sovereign, and by the entire subjection of the Irish chieftains completed by Lord Mountjoy, just before the decease of Elizabeth was evulgated, James found himself more favourably circumstanced than his predecessors for communicating to Ireland the benefits of English jurisprudence, and the advantages of civilization and regular government. It is surprizing that this prince should not have thought of allowing a catholic establishment in Ireland: that was the natural religion of the people, as calvinism was of the Scotch and bucerism of the English.

James effected much in Ireland. He approximated their tribunals to the English plan, and extended his laws beyond the pale. The authority of the Brehons had still continued in force; and with it the feudal practice of mulcting districts for a murder, instead of punishing the culprit. The whole country was now divided into thirty-two counties, each under the superintendence of a sheriff, and subjected to the jurisdiction of itinerant courts, which proved a wonderful defence to the numerous classes against tyrannical exactions. Another important reformation was the settlement of landed property. From the frequency of rebellions and disorders many forfeitures had occurred. For putting an end to controversies that had arisen with respect to crown grants, certain commissioners were appointed to examine defective titles, and the possessors were invited to surrender their estates into the hands of the governor, in order to obtain a new and more legal grant. This process was indeed contrived to fill the coffers of government, and to facilitate the seizure of unoccupied domain; but it was accompanied with the abolition of *tanistry*, and other tenures unfavourable to the investment of capital upon estates, so that it really benefited Ireland. A vast track of northern territory was thus usurped, and sold to the city of London, who colonized it with industrious inhabitants. The confiscation of property, in cases of treason, is always a mischievous policy: rapacity

forges accusation, and the innocent are made to suffer together with the guilty ; it should pass on as in case of a natural demise.

An excellent dissertation is that which respects the administration of the Earl of Strafford, and the conduct of the Irish catholics towards Charles I. The following anecdote of Cromwell has escaped many English historians :

“ The account of this Lord Broghill's devoting himself to the service of Cromwell, taken from his panegyrist rather than biographer (*Mem. of the Boyle family*, 1737, p. 42.) is submitted to the reader, as a specimen of the affection and loyalty of the Irish Protestants of that day, to the cause of the unfortunate Charles I. ‘ I have heard a certain great man, who knew the world perfectly well, assert, that a secret was never kept by three persons. His lordship had intrusted his secret to more than three ; and the Committee of State, who spared for no money to get proper intelligence, being soon made acquainted with his who's design, determined to proceed against him with the utmost severity. Cromwell was at that time general of the parliament forces, and a member of the committee. It is allowed by his enemies, that this wonderful man knew every person of great abilities in the three kingdoms : he was consequently no stranger to Lord Broghill's merit ; and reflecting that this young nobleman might be of great use to him in reducing Ireland, he earnestly entreated the committee, that he might have leave to talk with him, and endeavour to gain him, before they proceeded to extremities. Having with great difficulty obtained this permission, he immediately dispatched a gentleman to the Lord Broghill, who let him know that the general, his master, intended to wait upon him, if he knew at what hour he would be at leisure. The Lord Broghill was infinitely surprised at this message, having never had the least acquaintance, or exchanged a single word with Cromwell. He therefore told the gentleman, that he presumed he was mistaken ; and that he was not the person to whom the general had sent him. The gentleman readily replied, that he was sent to the Lord Broghill ; and therefore if he was that lord, that he was sent to him. His lordship finding there was no mistake in the delivery of the message, confessed that he was the Lord Broghill : he desired the gentleman to present his humble duty to the general, and to let him know, that he would not give him the trouble to come to him, but that he himself would wait upon his excellency, if he knew at what hour it would be most proper for him to do so ; and that in the mean time he would stay at home, to receive his further commands. The gentleman replied, that he would return directly and acquaint his general with what his lordship said. The Lord

Broghill, in the mean time, was under a good deal of concern, at what should be the meaning of this message. He never once suspected that his design was discovered ; but while he was musing in his chamber upon what had passed, and expecting the return of the gentleman, he saw Cromwell himself, to his great surprise, enter the room. When some mutual civilities had passed between them, and they were left alone, Cromwell told him in few words, that the committee of state were apprized of his design of going over, and applying to Charles Stuart for a commission to raise forces in Ireland ; and that they were determined to make an example of him, if he himself had not diverted them from that resolution. The Lord Broghill interrupted him here, and assured him, that the intelligence the committee had received was false : that he was neither in a capacity, nor had any inclination to raise disturbances in Ireland ; and concluded with entreating his excellency to have a kinder opinion of him—Cromwell, instead of making any reply, drew some papers out of his pocket, which were the copies of several letters the Lord Broghill had sent to those persons in whom he most confided, and put them into his hands. The Lord Broghill, upon the perusal of these papers, finding it was to no purpose to dissemble any longer, asked his excellency's pardon for what he had said, returned him his humble thanks for his protection against the committee, and intreated his directions how he ought to behave in so delicate a conjuncture. Cromwell told him, that though till this time he had been a stranger to his person, he was not so to his merit and character ; that he had heard how gallantly his lordship had already behaved in the Irish wars ; and therefore, since he was named lord lieutenant of Ireland, and the reducing that kingdom was now become his province, he had obtained leave of the committee to offer his lordship the command of a general officer, if he would serve in that war ; that he should have no oaths or engagements imposed upon him, nor be obliged to draw his sword against any but the Irish rebels. The Lord Broghill was infinitely surprised at so generous and unexpected an offer. He saw himself at liberty by all the rules of honour, to serve against the Irish, whose rebellion and barbarities were equally detested by the royal party and the parliament. He desired, however, the general to give him some time to consider of what had been proposed to him. Cromwell briskly told him, that he must come to some resolution that very instant ; that he himself was returning to the committee, who were still sitting, and, if his lordship rejected their offer, had determined to send him immediately to the Tower. The Lord Broghill finding that his liberty and life were in the utmost danger, and charmed with the frankness and generosity of Cromwell's behaviour, gave him his word and honor, that he would faithfully serve

against the Irish rebels. Upon which Cromwell once more assured him, that the conditions he had made with him should be punctually observed; and then ordered him to repair immediately to Bristol, to which place forces should be sent him, with a sufficient number of ships to transport them into Ireland. He added, that he himself would soon follow him; and was as good as his word in every particular."

The displacements of Irish proprietors, in order to make room for officers of Cromwell's army, too glaringly resemble those seizures of royalist and ecclesiastical property lately made in France, not to be viewed with a similar emotion. In poor countries, or poor times, when the revenues of a state are insufficient to recompense the efforts of armies, such measures have always been resorted to. There is, however, one other plan of provision, by which successful force may be bribed into tranquil alliance with the laws of property; namely, to grant according to his rank, a tenth, or twentieth, or hundredth part of the rental of a given parish, district, or hundred, to the individual officer who is to be recompensed. It is more equitable to assess all the proprietors, than to plunder some. In civil wars every one has a right to choose his side: after the battle, the winner must be provided for; but the less of vindictive retrospect to the unfortunate opinions, the better. Why should a passion for hereditary institutions, which originates in a love of order, or a passion for republican institutions, which originates in a love of liberty, be visited as crimes upon the principled enthusiast? Almost all counter-revolutions have originated in the persevering animosity of banished and plundered starvelings.

Neither from royalists nor republicans had the Irish protection, or justice. By the navigation-act passed under Charles II. their commercial privileges were restricted, under the absurd notion, that if one part of the empire thrives, that happens at the expence of every other. Under James II. the Irish made great efforts to defend their hereditary king against the intrusion of the house of Orange. This again occasioned confiscations without end. Surely the court of admiralty decided on opposite and juster principles than parliament; if the crews of privateers were not considered as pirates, which acted under letters of marque issued by James, while he lingered in Ireland.

In the year 1719, a private law-suit in Ireland, between Sherlock and Annesley, gave rise to a controversy whether there lay an appeal from the Irish tribunals to the house of lords in Great-Britain. This was followed by an act of parliament the sixth of George I. asserting in direct terms the right of the English parliament to make statutes to bind the people and kingdom of Ireland. Laws, however, avail little, unless ratified by the approbation of the wise, and sanctioned by the consent of the people. In 1768, the Irish rejected a money-bill altered in England; and obtained the abridgement of their parliamentary sittings, which formerly lasted the king's life, to the period of eight years. Short parliaments are not desirable; for in less than six years a demagogue can hardly attach the public to himself, or to his plan of measures. But it is very desirable to obtain frequent infusions of popular inclination, that the bent of the nation may be observed and attended to: so that if one-third of the members were dismissed every two years, instead of having cotemporary elections of the whole, the public business would be conducted more naturally, and a perpetual appeal to the people would be going on concerning the management of the public affairs.

During the war with the North American colonies, volunteers were embodied throughout Ireland. By degrees the questions of liberty and independence became topics of military curiosity. A free trade was obtained in 1778; and in 1782, the Rockingham administration removed those offensive regulations, which rendered the Irish government subordinate to the British.

From the beginning of the reign of George III. the narrative of Mr. Plowden becomes exceedingly detailed, and exceedingly interesting. It will, we doubt not, be read with lasting, if not general approbation. There are few countries, which in every period of its history, and under all the variations of its opinions, have so uniformly met with ungenerous treatment as Ireland. Far from wondering at its insurrections, one wonders at its patience: far from reproving its barbarism, one admires the degree of culture which it has known how to retain in spite of the trampling hoofs of anarchy, and the tearing harrows of military despotism. The usage of Corsica by Genoa is the most analogous instance: the same system of feudal

farming; the same useless commercial monopoly; the same interference with native legislation; characterized there the metropolitan managers; but Ireland had to depend on a protestant sovereignty, and in addition to civil had to suffer from religious intolerance and persecution. And of all the periods of interior suffering, that probably will be considered as the severest, which intervened between the recall of earl Fitzwilliam, and the dissolution of the anti-jacobin ministry. We trust that the approaching atonement will be as conspicuous as the past injuries; and that the union so happily accomplished will be the signal for diffusing civil, and extending religious liberty, for multiplying the furrows of the plough, of the shuttle, and of the keel; for invigorating commercial circulation, and for beckoning all the forms of merit into conspicuity and recompence.

As it is certainly incumbent on the Duke of Portland's party to account for their not having resigned on Earl Fitzwilliam's recall; if they wish to escape the charge of letting to the crown their instrumentality, for the execution of detestably harsh measures, which they all the while disapproved, we shall extract some allusions to this circumstance.

"Mr. Grattan, previous to the motion he was about to make, observed, that it had been asserted, that in the conduct of the ministers of the crown towards that country, no blame could attach to the minister of Great Britain, or to any of his colleagues. He did not pretend to ascertain the real causes of the recall of the late chief governor, but was informed, that two causes were alleged; as to the removal of certain great officers, he observed, that such removal was matter of stipulation on one side, and engagement on the other. He spoke of nothing of what he was confidentially informed, but asserted what he knew was generally known, and repeatedly communicated; he said, that the leading member of the coalition declared, 'he accepted office principally with a view to reform the abuses in the government of Ireland; that the system of that government was execrable, so execrable as to threaten not only Ireland with the greatest misfortune, but ultimately the empire; that his Grace would have gone in person if he had not found a second self in Lord Fitzwilliam, his nearest and dearest friend, whom he persuaded to accept the Irish government, and to whom he committed the important office of reforming the manifold abuses in that government.' That he had obtained, with regard to that country, extraordinary power;

the information of that extraordinary power, he communicated to his Irish friend; he consulted members of the Irish opposition touching his arrangements of men and measures, and ardently espoused, as an essential arrangement, those principal removals, which were supposed to have occasioned the recall of the deputy; an explanation and limitation of his powers did indeed afterwards take place, but no such limitation or explanation as to defeat either the stipulated measures or the stipulated removals, one only excepted, which never took place. Another question now arose, whether that quarter of the cabinet could without blame recall the viceroy for carrying into execution those specific engagements; whether they could without blame recall their minister of reform, for removing, according to stipulation, some of the supposed ministers of abuse; and to continue the ministers of abuse in the place of the minister of reformation. He therefore concluded, that if the Irish removals were a ground for the viceroy's recall, blame did attach at least to one quarter of the British cabinet.

"The second alleged cause was, the catholic bill. Upon this the principles and declarations of that quarter were decided; the catholic emancipation was not only the concession of that quarter of the cabinet, but its precise engagement. His friends repeatedly declared they never would support any government, that should resist that bill, and it was agreed by that quarter with concurrence; and he was informed from persons in whom he could not but confide, of another; that the instruction was, if the catholics insisted to carry forward their bill, that the government should give it a handsome support. Before he concluded his speech, he thus summed up the acts of earl Fitzwilliam's administration: it had paid attention to the poverty of the people, by plans for relieving the poor from hearth-money, and paid attention to their morals, by a plan increasing the duty on spirits; had paid attention to their health, by proposing to take off the duties on beer and ale; that a plan for education had been intended; that a more equal trade between the two countries had not escaped their attention; that an odious and expensive institution that obtained under colour of protecting the city by a bad police, was abandoned by that government, and a bill prepared for correcting the same; that a responsibility bill had been introduced, and a bill to account for the public money by new checks, and in a constitutional manner, had been introduced by the persons connected with that government; that it was in contemplation to submit for consideration some further regulation for the better accounting for the public money, and for the better collection of the revenue; that those occupations were accompanied by great exertions for the empire; so that administration established the compatibility of the services, do-

mestic and imperial, and made a good system of domestic government the foundation of unanimity in support of the empire; that in consequence of such a conduct, a war not very fortunate, had ceased to be unpopular, and levies of an extraordinary proportion were not a ground of complaint. In the midst of all this, the British cabinet dissolved the government, and professed to dissolve it for the preservation of the empire. They converted a nation of support into a nation of remonstrance, and unanimity in favour of government to unanimity against her."

This history is continued with instructive minuteness through the whole of the late rebellion, of which however the civil rather than the military history is given, and to the final accomplishment of the union; an event, says Mr. Plowden, affording the sure means of conciliating the affections, consolidating the energies, and promoting the prosperities of every part of the British empire.

This work is in its execution meritorious; in its tendency useful; in its ap-

pearance seasonable. Its chief fault is the want of proportion: the early history from Henry the second to Anne being excessively abbreviated; and the late transactions excessively expanded. If the work professedly contained only the history of Ireland, from the accession of the house of Hanover to the present time, it might have been compressed into two quartos, and would have been passed for a completer work. We recommend to the author to revise and expand the earlier portion of his labours: and if the immediate diffusion of his book is, as we sincerely believe, important to the consolidation of that union of spirit, without which the constitutional junction will little avail, between the two nations; rather to let his octavo edition begin with the accession of the Stuarts.

A copious appendix of state-papers and other documents is annexed: these again might partly be omitted in a cheap edition for popular circulation.

ART. VIII. *Historical View of the English Government, from the Settlement of the Saxons in Britain to the Revolution of 1688.* By JOHN MILLAR, Esq. 4 vol. 8vo. pp. 496.

OF the two first volumes of this work a quarto edition was published in 1787. It was received with that select approbation which surpasses popularity, in the estimate of a writer of judgment and intellect. The distinguished author is now no more: his surviving friends, with a becoming solicitude for the public instruction, have republished the *Historical View of the English Government*, which extended to the accession of the house of Stuart; and have annexed the finished *Continuation*, which extends to the Revolution, and which occupies the third volume: and also some unfinished chapters and fragments, which were to have included a critical estimate of the present times. These chapters and fragments fill the fourth volume of this edition. The whole work, and this is high praise, is worthy of the author of an *Enquiry into the Origin of Ranks*.

Several continental writers have acquired diffusive reputation by treating on the philosophy of history: among the French, Voltaire, by his *Essay on the Manners and Spirit of Nations since Charlemagne*: among the Germans, Herder, by his *Philosophy of History*, and Adelung, by his *History of Culture*. It cannot be too often repeated, that

permanent revolutions are the result of general causes; and that the effects of individual ability vanish with the individual, whenever he is not the organ of a sect, the instrument of a party, the chieftain of a confederacy, or the representative of a multitude. A great man is the tongue or the hand of a great party. Laws and institutions are the result of predisposing causes, not of personal caprice; else they never endure: so that, in the general course of things, that which is natural mostly comes to pass: the crimes of fanaticism, the martyrdoms of enthusiasm, are useless alike: the quiet persevering "so be it" of the numerous classes, eventually conquers all the resistance of embodied faction, or of established power.

Among the philosophers of history, professor Millar merits a high, perhaps the highest, rank. The sagacity with which he detects and indicates, even in remote periods, those predisposing circumstances, which produced the general flow of event, is wholly unrivalled. His generalizations, or theoretical inferences, are numerous and very ingenious. His knowledge of human nature may seem confined to man in the abstract, and his indifference to individual merit so

philosophic as to be mortifying; yet his reflections evince deep penetration, and his discussions a discriminating subtlety. It was the intention of the author to have divided his commentary on the period subsequent to the accession of the house of Stuart into two parts: the first comprehending the history of those contests between prerogative and privilege, which by the Revolution in 1688 were terminated in a manner so consonant with the spirit of the nation, and so satisfactory to the happiness of the people: the second containing the rise and progress of the influence of the crown, an influence which, though in some measure checked by the general diffusion of knowledge, and the advancement of the arts, was to become the more dangerous to the constitution, as its slow and insensible advances are less apt to excite attention. This second part only is imperfect; a loss the more to be lamented by every friend to literature and liberty; as it would no doubt have contained practicable suggestions for the remedy of a grievance which is, in our own times, the critical distemper, the baleful complaint, the gnawing cancer of the country.

To the work is prefixed, an eloquent dedication to Mr. Fox: it may be considered as the parting advice of disinterested wisdom, and will encourage the pupils of the philosopher to rely on that statesman for the indication of the appropriate remedy for the disorders of the constitution of the country.

From those portions of the work, which have already attained, in the public estimation, a classical rank, it would be needless to select specimens: we pass on, therefore, to some characteristic reflections on the execution of Charles the First.

"The trial and execution of Charles was doubtless intended for the purpose of introducing a republican form of government; and according as we hold such a revolution to have been expedient, or the contrary, we shall be led to condemn, or approve of that measure.

"Concerning the general question, whether a government of this nature was, at that period, accommodated to the circumstances of the English nation, it may be difficult to form a decisive opinion. Many politicians have asserted, that a republican constitution is peculiarly adapted to a small state, and cannot be maintained in a large community. This doctrine seems to have arisen from a view of the ancient republics,

in which the whole people composed the legislative assembly; and is evidently inapplicable to those modern systems of democracy, in which the legislative power is committed to national representatives. Nothing is more common than for philosophers to be imposed upon by the different acceptance of words. The nations of antiquity having no notion of a representative government, countries of large extent were subjected universally to an arbitrary and slovenly despotism; and it was only in a few small states that it was thought practicable for the mass of the people to retain, in their own hands, the supreme powers of public administration. The expedient, employed first in modern times, of substituting representatives, in place of the whole people, to exercise the supreme powers in the state, has removed the difficulty of communicating a popular constitution to countries of a great extent; as it may prevent the legislative assembly from being too numerous, either for maintaining good order in its deliberations, or for superintending the conduct of the chief executive officers.

"If, by a republic, is meant a government in which there is no king, or hereditary chief magistrate, it should seem, that this political system is peculiarly adapted to the two extremes, of a very small and a very great nation. In a very small state, no other form of government can subsist. Suppose a territory, containing no more than 30,000 inhabitants, and these paying taxes, one with another, at the rate of thirty shillings yearly; this would produce a public revenue, at the disposal of the crown, amounting annually to 45,000*l.* a sum totally insufficient for supporting the dignity and authority of the crown, and for bestowing on the king an influence superior to that which might be possessed by casual combinations of a few of his richest subjects.

"Suppose, on the other hand, a territory so extensive and populous as to contain thirty millions of inhabitants, paying taxes in the same proportion; this, at the free disposal of a king, would bestow upon him an annual revenue, so enormous as to create a degree of patronage and influence which no regulations could effectually restrain, and would render every attempt to limit the powers of the crown in a great measure vain and insignificant. In such a state, therefore, it seems extremely difficult to maintain the natural rights of mankind otherwise than by abolishing monarchy altogether. Thus, in a very small state, a democratical government is necessary, because the king would have too little authority; in a very great one, because he would have too much. In a state of moderate size, lying in a certain medium between the two extremes, it should seem, that monarchy may be established with advantage, and that the crown may be expected to possess a sufficient share of authority for its own preservation, without

endangering the people from the encroachments of prerogative. How far England was in these circumstances at the period in question, I shall not pretend to determine."

The character of Cromwell is discussed with interesting detail, and his reign examined with curious severity; but it will be more instructive to hear our author on the topic of the revolution settlement.

"Of all the great revolutions recorded in the history of ancient or of modern times, that which happened in England, in the year 1688, appears to have been productive of the least disorder, and to have been conducted in a manner the most rational, and consistent with the leading principles of civil society. When a sovereign has violated the fundamental laws of the constitution, and shewn a deliberate purpose of persevering in acts of tyranny and oppression, there cannot be a doubt but that the people are entitled to resist his encroachments, and to adopt such precautions as are found requisite for the preservation of their liberty. To deny this, would be to maintain that government is intended for the benefit of those who govern, not of the whole community; and, that the general happiness of the human race ought to be sacrificed to the private interest, or caprice, of a few individuals. It cannot, however, be supposed, that such resistance will ever be effected without some disturbance, and without a deviation from those forms and rules which are observed in the ordinary course of administration. When the machine is out of order, it must be taken to pieces; and in the repairing and cleaning of the wheels and springs, there must be some interruption and derangement of its movements. When a general reformation of government has become indispensable, it must be conducted according to the exigency of times and circumstances; and few situations will occur, in which it is practicable without many temporary inconveniences, or even without violence and bloodshed. It is the part of prudence and of justice, in those cases, to adopt such measures as are likely to produce the end in view with the least possible hardship; so that, although violent and irregular, they may be justified by the great law of necessity.

"In consequence of a very general and pressing invitation from the English nobility and gentry, the prince of Orange, about the end of the year 1688, landed, with an armed force, in England; and immediately published a declaration, that the sole purpose of his undertaking, was to obtain the dismissal of the roman catholics from those offices of trust which they held contrary to law, and the calling of a free parliament for the redress of grievances. Though the nation was in some measure apprised of this

event, yet, intimidated by the unusual situation, they remained, for a short time, irresolute and in suspense; but soon after, an universal approbation of the enterprise was manifest from the conduct of the people in all quarters, who resorted to the prince, and formed an association to support his measures. The king found himself deserted by those upon whose fidelity he had most reason to rely; even by his own family, the prince and princess of Denmark, and by a great part of that army which he had provided to enforce his authority.

"In this alarming conjuncture, it might have been expected that James, to extricate himself from the difficulties in which he was involved, would have embraced one or other of two different plans. By encountering the present danger with firmness and resolution, by collecting the forces that were still faithful to him, and by endeavouring to scatter dissension among his enemies, who, notwithstanding their union in demanding a free parliament, were far from coinciding in their political opinions, he might perhaps have been successful, in defending his crown, at least, in protracting the war, till he might obtain assistance from France. By conciliatory measures, on the other hand, by giving way to the complaints of the people, by assembling a new parliament, and submitting to certain restraints upon the prerogative, he might have endeavoured to lull the nation in security, trusting to some future opportunity of retracting or evading those concessions. If either of these plans, however liable to censure, had been pursued, it is likely that the consequences to the public would have been fatal. But, happily, James was thrown into such consternation as to be incapable of persisting in any settled resolution. Yielding to the impressions of fear and despondency, he quitted entirely the field of action, and withdrew, for the present, into a foreign country. By this imprudent step, the remains of his party became quite disheartened, and were no longer in a condition to oppose the new settlement.

"The prince of Orange, having thus no enemy to cope with, proceeded to execute the task he had undertaken, by referring to the people themselves, the redress of their own grievances, and by employing the power which he possessed, for no other purpose than that of securing to them the privilege of settling their own government. As, in the absence of the king, the ordinary powers of the constitution could not be exerted, the most rational and proper expedients were adopted to supply the deficiency. The prince invited all those who had been members of any of the three last parliaments, to hold a meeting for the purpose of giving their advice in the present conjuncture. By their direction, he called a convention, composed of the usual members of the house of peers, and of the representatives of the counties and boroughs, elected in the same man-

ner as in a regular parliament. This meeting assembling at a time when the whole nation was in a ferment, and when the people, having arms in their hands, were capable of making an effectual opposition, its determinations, which passed, not only without censure, but with strong marks of public approbation and satisfaction, must be considered as the voice of the community at large, delivered with as much formality, and in a manner as unexceptionable as the nature of things would permit. In this convention the main articles of the revolution-settlement were adjusted; though to remove, as far as possible, every appearance of objection, they were afterwards confirmed by the sanction of a regular parliament.

"That the king, who had shewn such a determined resolution to overturn the religion and government of the kingdom, and that his son, then an infant, who, it was foreseen, would be educated in the same principles, and until he should arrive at the age of manhood, would be under the direction of his father, and of his father's counsellors; that those two persons, whatever might be the reverence paid to their title, should be excluded from the throne, was, in the present state of the nation, rendered indispensibly necessary. In the convention, however, this point was not settled without much hesitation and controversy. The two great parties who, since the reign of Charles the First, in a great measure divided the kingdom, had shewn themselves almost equally disposed to resist the arbitrary measures of James for introducing the popish religion. But though a great part of the Tories had, from the terror of popery, joined in the application to the prince of Orange, that he would assist them with a foreign army, to procure the redress of grievances; no sooner were they delivered from their immediate apprehensions, than they seemed to repent of their boldness, relapsed into their old political principles, and resumed their former doctrines of passive obedience. They at least carried those doctrines so far as to maintain, that the people had no right, upon any abuse of the regal power, or upon any pretence whatever, to punish the sovereign, or deprive him of the sovereignty; and that even supposing the king to have resigned or abandoned his royal dignity, the throne could not upon that account, be rendered vacant, but must immediately be filled by the prince of Wales, to whom, upon the death of his father, the crown must be instantly transferred. According to this view, it was contended, that, in the present emergency, the administration should be committed to a regency; either in the name of James, if he was to be considered merely as absent; or in the name of his son, if the father had actually abandoned the sovereignty.

"The Whigs, though they entertained more liberal notions of government, were unwilling to fall out with their present con-

federates; and endeavoured by a temporising system, to avoid unnecessary disputes upon abstract political questions, and to render the new settlement, as much as possible, unanimous and permanent.

"It is a matter of curiosity to observe the public debates on this important occasion; in which the natural spirit and feelings of men, made up for the narrowness of their philosophical principles; and in which a feigned and ridiculous pretence was employed to justify a measure which they did not scruple to execute. They supposed that, by leaving the kingdom, James had abdicated the government; instead of boldly asserting that, by his gross misbehaviour, he had forfeited his right to the crown. That James made his escape rather than comply with the desires of his people, or assemble a parliament to deliberate upon the redress of grievances; was the real state of the fact.—But that he meant by this to yield up, or relinquish his authority, there certainly was no ground to imagine. His flight was the effect of his obstinacy and his fear; and was calculated to procure the protection of a foreign power, by whose aid he entertained the prospect of being soon reinstated in his dominion. We cannot help pitying the most enlightened friends of liberty, when we see them reduced, on that occasion, to the necessity of softening the retreat of James, and his attempt to overturn the government, by regarding them as a virtual renunciation of his trust, or voluntary abdication of his crown; instead of holding them up in their true colours, of crimes, deserving the highest punishment, and for which the welfare of society required, that he should at least be deprived of his office.

"In Scotland, where a majority of the people were Presbyterians, and felt an utter abhorrence, not only of popery, but of that episcopal hierarchy to which they had been forcibly subjected, and where the reformation, as I formerly took notice, had diffused among all ranks, a more literary and inquiring spirit than was known in England; the convention, which was likewise called by the prince of Orange for the same purpose as in the latter country, discovered, or at least uttered, without any subterfuge, more manly and liberal sentiments. 'The estates of the kingdom found and declared, that James VII. had invaded the fundamental laws of this kingdom, and altered it from a legal and limited monarchy, to an arbitrary despotic power; and had governed the same to the subversion of the protestant religion, and violation of the laws and liberties of the nation, inverting all the ends of government; whereby he had forfeited the crown, and the throne was become vacant.'

"But though the language employed by the leaders in the English convention, was accommodated to the narrow prejudices of the times, their measures were dictated by sound and liberal policy. Setting aside the

king; and the prince of Wales, in consequence of the declaration already made, the right of succession to the crown devolved upon the princess of Orange, the king's eldest daughter, who had been educated in the protestant religion, and was thought to be under no disqualification from holding the reins of government. There was no intention of converting the constitution into an elective monarchy, or of deviating further from the lineal course of inheritance than the present exigence required. The same circumstances, however, which demanded the advancement of the princess of Orange to the throne, made it also necessary that the regal authority should be communicated to her husband. It would have been absurd to banish an arbitrary and despotical prince, to break the line of descent, by which the crown was commonly transmitted, and, for promoting the great ends of society, to run the hazards always attendant on the correcting former abuses, without making, at the same time, a suitable provision for maintaining the new settlement. But the state of Britain, and of Europe, rendered this a difficult matter. From the efforts of the popish party at home, from the power of Lewis XIV. and the machinations of the whole Roman catholic interest abroad; not to mention the prepossessions of the populace in favour of that hereditary succession to the crown which old usage had rendered venerable, there was every reason to fear a second restoration, with consequences more fatal than those which had attended the former. Against those impending calamities, nothing less than the abilities, and the authority of the prince of Orange, the head of the protestant interest in Europe, could be deemed a sufficient guard; and it was happy for the liberties of mankind, that the matrimonial connection of Mary with a person so eminent, and so circumstanced, had, by suggesting his participation of her throne, provided a barrier so natural, and so effectual.

“ From these considerations, the prince and princess of Orange were declared, by the convention, to be king and queen of England; but the administration of the government, was committed solely to the prince. After determining this great point, the convention, in imitation of the mode of procedure at the restoration, was, by a bill passing through the two houses, and obtaining the royal assent, converted into a parliament; and that assembly proceeded immediately to a redress of grievances.”

The fourth volume contains a review of the government of Ireland; an estimate of the political consequences of the revolution; a discussion of the consequences to civil liberty arising from the advancement of commerce and manufactures; a disquisition on the separation of the different branches of knowledge, and on the progress and influence of the liberal arts, and of fine literature.

These chapters do not comprehend much original matter: they are chiefly selected from favourite writers, such as Adam Smith; and seem to contain the arranged pebbles of the future mosaic, but to await the glue, or cement, which was to consolidate and to give a homogeneous tinge to the delineation. They abound with incorrectnesses, probably of the press, especially where proper names or quotations from the foreign languages occur. A quarto impression of this additional matter will, no doubt, be undertaken, in order to accommodate the purchasers of the former edition: we trust that care will be taken to request some man of letters to overlook the proofs, and to consecrate a biographical monument to the remembrance of talents, which have given esteem to liberty and lustre to his country. The dissertation on the origin of ranks might be included in the collection.

This department of speculation is far from exhausted: it is to be wished that every leading train of historical event had thus its theoretical commentator. The moral of history is often more sensible to the reader than to the annalist. The office of the philosopher may expediently be separated from that of the historian. The investigation of fact will be more impartial, if no theoretical inferences are kept in view; and theoretical inferences will be more equitable, if derived from an equally attentive survey of the whole mass of event, than if rivetted to particular periods and circumstances by those occasional applications of research, which the necessity of local and incidental investigation often imposes on the professed chronicler.

ART. IX. *The History of the Wars which arose out of the French Revolution. To which is prefixed, a Review of the Causes of that Event.* By ALEXANDER STEPHENS, Ato. 2 vols. pp. about 1300.

THE first duty of an historian is information, the second fidelity, the third beauty. He has no pretensions to write at all, who has not something more to

tell us of the event he narrates, than had already reached us through the channelled courses of intelligence. He who perversely employs his superior knowledge, who comments the chronicle of ages, like Voltaire, in order to extract from it, for the statesman, rules of conduct, in which experience offers him no sufficient countenance, injures the community in which he is trusted; although, by provoking fresh experiments, he eventually rectifies the general sentiment. He who wants the graces and amenities of diction, rather injures himself than his readers; he prevents the circulation, but he does not corrupt the moral of his tale: he has still expounded the voice of the event, and taught the lessons of experience.

The author of the history before us has not, we think, displayed all the information which the subject admitted. In domestic sources of intelligence he is indeed rich; and beside the printed documents so abundantly supplied by our newspapers, registers and pamphlets, he has availed himself of much oral information, from naval and military men present at the engagements narrated. Wherever the fortunes of the English arms are concerned, that sort of pains seems to have been taken, which ought to be the foundation of a primary narrative, on which public criticism has here and there to hang its amendments. In French sources of intelligence, there is no very marked oversight; but no very meritorious abundance of research. In Italian and German consultation, there is a sensible deficiency: *Posselt's Tagebuch*, or Journal of the War, for instance, which contains very interesting particulars, especially of the campaigns in Germany, and which had every claim to attentive and perpetual reference, is not among the authorities cited.

Of the fidelity and impartiality of the relation, we form, on the whole, a favourable opinion. The author shows indeed, at the beginning of the war, some leaning toward the cause of the French; but it was at that time the cause of liberty really, and of human happiness apparently; so that to have any other bias would, in justice, be a ground of reproach.

The style has most beauty where it has least burnish: an attempt at the solemn condensation of Tacitus is made in the preface and introduction; but the clearness and interest of the narrative

gain in proportion, as the historian by profession disappears. We shall extract, from the preface, the author's outline of his argument:

"At no period either in ancient or in modern times have the revered names of religion, liberty, and social order, been so frequently invoked or so audaciously prostituted; and it is to be feared, that the civil rights of individuals, as well as that system of public morals called the law of nations, have received a deep and incurable wound.

"But, on the other hand, it is a series of singular, magnificent, and disastrous events, like that just alluded to, which affords suitable imagery for narrative, and constitutes at once the miseries of society and the materials for history. He who is destined to detail recent transactions, if actuated by the spirit of truth and independence, will have to recapitulate such a multitude of enormities, that the reigns of Nero and Domitian must appear less intolerable from comparison. The murder of prisoners in open day; the public detention and assassination of ambassadors; the uncontrolled reign of that panic terror which appalled the innocent, and not unfrequently spared the guilty; the triumph of men of blood over the public enemy as well as the most virtuous of their fellow citizens; one faction swallowing up another, while the instrument of destruction was stretched forth, and the tomb yawned, for the victors; a frantic populace dividing the palpitating members of their victims, and a king coolly murdering those subjects who had yielded to the faith of a solemn treaty; the torture, at once the mark of a barbarous age and the opprobrium of a civilized one, publicly inflicted; while, as if to form a climax and realise the metaphor of the ancient poets, the dogs of war were literally unchained, and the canine race employed to hunt down the human species;—such is the galaxy of crimes presented during this night of wonders.

"Yet, notwithstanding these hideous pictures, Europe has displayed many uncommon instances of heroism, and some scenes have occurred in a neighbouring country, which surpass all that is to be found during the boasted reigns of Marcus Aurelius and the Antonines. Never did any nation exhibit such magnanimity, when threatened with subjugation, slavery, and dismemberment, on the part of the combined monarchs of the continent. Never did so many orators, philosophers, men of letters, and statesmen, convince such a perilous and deadly enemy to anarchy, injustice, and bloodshed; or prefer with so much readiness the uplifted axe of the executioner to the scorn of their contemporaries and the reproaches of posterity.—Even the softer sex, assuming a masculine courage, maintained their principles on the scaffold, and perished without a sigh before the statue of outraged liberty.

"The art of war too, during this memor-

able period, has been carried to a greater degree of perfection than in any former age; and the young tacticians of the new school have overcome generals grown hoary under arms. The machinery of battles has been calculated on a more gigantic scale; fleets have not only fought with greater fierceness, but exhibited evolutions hitherto unknown or unpractised; a single army sometimes extended its wings from the frontiers of France to the heart of Italy, while at other periods, one immense line of soldiers has occupied the intervening countries from the banks of the Rhine to the shores of the Adriatic."

The introduction is too far fetched. Its first section contains an historical survey of the conquests and jurisprudence of the Romans, which are certainly not among the predisposing causes of the revolution of France. The origin of the feudal system deserved indeed enquiry; because its overthrow constitutes the most characteristic feature of the legislative innovations of the Parisians. The history and progress of the anti-Christian sect merited perhaps a more minute investigation, as it formed the fanatical substratum, the bond of opinion, which had most influence in confederating the disinterested zeal of the French.

The first book begins with the declaration of war, and extends to the retreat of the Prussians. More attention should have been paid by an English historian of these transactions, to the share and the narrative of General M<sup>o</sup>ny.

The second book extends from the capture of Worms, to the political embarrassment of Dumourier.

The third book includes the execution of Louis XVI. and the subsequent operations, to the failure of the Duke of York before Dunkirk. A just censure on the conduct of the admiralty, is temperately passed in these words:

"Thus ended the fatal attempt upon Dunkirk, in the course of which the English army assuredly did not receive that assistance and co-operation by sea, which it was in the power of a great maritime nation to have afforded; while the enemy by their numbers, their audacity, and their zeal, demonstrated that although the ruling party was capable of the most enormous crimes, it at the same time knew how to inspire enthusiasm, and ensure victory. So far were the French from being dazzled with the late success, and the subsequent capture of Furnes and Menin, that Houchard was immediately arrested, and soon after put to death, because he had not completed his triumph by the capture of the

army destined to besiege Dunkirk. On the other hand, care was taken to reward such officers as had distinguished themselves; and Jourdan, who had attacked the right and centre of the camp at Hondschoote, as well as Hoche, who had charged the left wing, were both promoted; a decree passed at the same time, declaring, "that the army of the North had deserved well of the country;" and the representatives on mission were enjoined to transmit a detailed account of the heroic exploits of the defenders of the republic."

The fourth book is occupied partly with the operations of the combined fleets in the Mediterranean, and partly with the campaign on the Rhine, of which Hoche and Pichegru changed the fortune.

The fifth book narrates the immense, the mortifying, the irreversable successes of France in 1794 and 1795. The reconquest of Austrian Flanders, the over-running of Holland, the acquisitions along the Rhine, the seizure of the gates of Italy, successively occur, like the messengers of woe, in the fifth act of a tragedy, with long catalogues of certain disasters, and the expectation of approaching and greater devastation. The darkness of the picture is somewhat relieved by maritime triumph.

Of the second volume, the first book comprehends the treaties of peace with Tuscany, Prussia, Spain, Hanover, Hesse, and the insurgents of La Vendée. The conquests, or rather acquisitions of the English at Ceylon and the Cape, and their naval campaigns in the West Indies and in the Mediterranean, are also included. Bonaparte's brilliant success in Italy; Moreau's respectable management in Germany; and the unwise evacuation of Corsica, were worthy to have formed a separate subdivision.

The second book traces the progress of the war, from the treaty of Leoben to the capture of Minorca. Bonaparte's seizure of Malta, is a fragment which it will yet be interesting to extract, as the fortunes of the island continue to engage a zealotry of hostile attention, more than commensurate with its statistical value.

"This little island, which was defended by its gallant knights for more than two hundred years against the whole power of the Mussulman empire, and had expelled the Sultaun Solymán with immense slaughter about the middle of the sixteenth century, was strongly fortified on all sides, but Valetta constituted its chief defence. That city is built on a peninsula; its walls are for the

most part surrounded by the waves, and it is built on the declivity of a hill called Scebera. The front which looks towards the sea, and is protected by the castle of St. Elnio, has always been considered as inexpugnable; that flank facing the principal harbour is defended by Ricasoli and the castle of St. Angelo, while the forts Manoel and Tigné guard it on the side of Mursa Murcet. Bastions, cavaliers, covered-ways, the Bourg, Burmola, the Cotoner, in short, all the means of defence that the genius of Vulpurga could point out, had been employed.

"As every thing was considered as subordinate to the protection of Valetta, the old city, nearly in the centre of the island, was only intended to hold out during a few hours; neither could the entrenchment called Nasciar, constructed along the chain of hills which traverses Malta, long resist a powerful enemy; but ample precautions were taken to prevent a disembarkation. Batteries and towers had been erected for this purpose on every point, the chief of which are demonstrated St. Paul and Marsa Sirocco, built so as to command two of the ports, and produce a cross-fire of red-hot bullets. In addition to this, the rocks were cut at intervals into the form of immense mortars, and being loaded with grape-shot, are so calculated as to overwhelm the invaders with inevitable destruction. In short, according to the system of defence laid down for Malta, it might be considered as impregnable if maintained with skill and courage.

"The progress of the revolution had been highly disadvantageous to the order of St. John: but an emperor, smitten with the love of chivalry, had lately evinced a partiality to its institutions; and the head of the Greek church, although considered as a schismatic by this orthodox confraternity, promised to restore the consequence of knights, whose splendor had been eclipsed in consequence of the lack of zeal on the part of the christian princes of the north in a former age, and the French revolutionists during the present. —The Count Ferdinand de Hompesch, descended from an ancient and illustrious family, and the first grand-master who had ever been a German, presided at this moment as the sovereign. The chevaliers were in number three hundred and thirty-two; but as fifty were incapable of service on account of their age, two hundred and eighty-two only were able to carry arms. The troops and militia, consisting of seventeen thousand two hundred and eighty-two men, were capable of affording a formidable resistance, but they were not actuated by similar motives. Great dissensions had unfortunately taken place between the order and its subjects; the latter were accordingly disaffected; many of the French knights were also dazzled with the glory lately acquired by their country; and the arrival of the conqueror of Italy, supported by a numerous army and powerful

fleet, was calculated to make a great impression on all the other tongues.

"However, the grand master, on the first appearance of an armament which still continued to keep all Europe in suspense, had assembled the militia, ordered the troops kept in reserve to march into the forts, and all the necessary preparations to be made for the defence of the island. The great council, consisting of twenty grand commanders, priors, baillies, treasurers, an admiral, a bishop, and a grand chancellor, were assembled; the Prince Camille de Rohan, as seneschal, mustered the armed inhabitants; the bailli de Loras, as marshal, undertook the defence of Valetta; the old city was regulated, according to established custom, by a Maltese governor; all the commanders repaired to their respective posts, and the galleys then cruising were enjoined to return immediately.

"In the mean time, Bonaparte only wanted a pretext to seize on the island: he began therefore by demanding leave for his fleet to enter the port; on this the grand master and council informed the Consul of France, that it was contrary to the laws of the order that all the squadron should enter, but that every necessary refreshment should be distributed among the soldiers and seamen. No sooner was this answer made public than the commander Bosredon Rasieat, after reading a letter from Dolomieu, another chevalier, then on board of the *Orient*, informed his chief 'that he begged leave to resign his employment, as he had only sworn to wage war against the Turks, and was not disposed to carry arms against his countrymen.'

"By break of day next morning all the boats of the fleet were seen rowing to the shore, and a letter was presented to the grand master from the representative of France, threatening to obtain by force what had been so inhospitably denied; but at the same time promising to respect the religion, customs, and property, of the Maltese. The debarkation, however, was not effected until seven o'clock at night, when the soldiers were landed at the roadstead of la Madelaine, the only place in the island where the rocks were neither mined nor cut into mortars; ample means of defence, however, presented themselves, and the progress of the enemy might have been instantly arrested. Inclination alone was wanting. After firing a single cannon, the knight who commanded the tower of St. George deserted with his garrison to the enemy. The battery at the point of St. Julian was also abandoned, and the regiment of militia of Birkarhara, posted there, took refuge under the cannon of fort Manoel.

"While terror and distrust seized on all in consequence of these unexpected events, a report was suddenly spread and believed, that all the French, Spanish, and most of the Italian knights, had entered into a conspiracy

with the enemy, who by this time had advanced to the entrenchments of Nasciar, and seized on all the artillery, now abandoned by the fugitives. A picquet of cavalry, sent by the grand master to the old city, was, nearly at the same time, refused entrance by the governor, who, as well as the regiment stationed there, stated that they were determined not to quarrel with the French.

"Notwithstanding this general defection, the grand seneschal established his headquarters at Floriana, the bailli de Clugny assumed the command of Fort Ricasoli, the bailli Tomasi remained firm at his post, and the fire of the forts St. Elmo and Tigné produced great execution; while a sally was made with a galley and two galliots, which cannonaded the French shallows, still employed in carrying fresh troops, and sunk two of them.

"But the dawn of the succeeding morning discovered that the enemy had encircled the city, stopped the supplies of provisions and ammunition, and were erecting redoubts to batter the place. On this the confusion soon became general; nine hundred of the regular troops refused to attack a post occupied by the enemy; whole companies of militia expressed a determination not to be shut up within the fortifications, and it was found necessary to relieve all the posts commanded by the French chevaliers.

"At length the nobles, the advocates, and the burghers, who had retired from different parts of the island into the city, on the approach of evening surrounded the palace of the grand master, and stated, that as there could no longer be any doubt of treachery, they had drawn up a declaration and presented it to the Dutch consul, intimating their resolution of surrendering to the French; it was added, that they had requested him to transmit the capitulation to Bonaparte, either with or without the consent of the order. Several of the knights were at the same time massacred, a bloody head was carried about on a pike, and it was with great difficulty that the chevaliers of the priories of Castille and Bavaria could prevent the minister of Russia from being killed during the tumult. The doors of the council chamber were soon after burst open, the bodies of the murdered chevaliers presented to the members, and the sovereign himself threatened with death.

"During this dreadful period of suspense, Ransijcat, who had been released from prison, Formosa, the consul of Holland, Doublet, the under-secretary of state, the bailli Frisari, and the chevalier Amati, minister from Spain, were sent by the insurgents to the French camp, where they obtained an armistice during twenty-four hours, and the terms of capitulation were immediately debated upon and agreed; but neither the grand master, nor the council, nor the congregation of state, affixed their signatures.

"At length the French entered the city,

and seized on all the posts; while Ransijcat and Doublet presided over the municipality, and regulated the internal police."

The third book begins with the capture of Naples, and ends with that of Seringapatam. We know not whether these oriental transactions belonged to the proper subject of our author. The conquest of Mysore, would equally have taken place from motives of local ambition and opportunity, whether Great Britain had engaged or not in the wars of the French revolution; and it may reasonably be doubted, whether the extinction of a French interest in Hindostan, will not too speedily endanger the allegiance of the whole mass of our oriental possessions. The conquest of Canada was the loss of North America; that of Pondicherry and Ceylon, and Mysore, may convince our Indian government, that it no longer needs an European protector. Under the mischievous subdivision of authority, between the company and the board of controul, one of the parties will become discontented. The commercial opinion of London, will probably favour the alliance of the state with the weaker power, and occasion a wish for separation, under the pretence, or for the sake of obtaining that unrestricted intercourse; which, if granted by the courage of our statesmen, would have operated as a connecting cement, and a thickening bond of union.

The eighth chapter of this book narrates that unfortunate expedition to Holland, the causes of whose failure are still covered with a veil; which, for the instruction of those who may have to renew a similar attempt, it would be desirable to draw aside.

The fourth book opens with the accession of Bonaparte; and the unfortunate, the uncivil, the unwise, the unaccountable refusal of Lord Grenville to treat with him. It includes the affairs of Egypt, which are continued in the fifth and concluding book. The sixth, and final chapter, records the negotiations which terminated in the treaty of Amiens.

The results of this long and wide-wasting war, are thus, with condensed precision, summed up by the judgment of the author:

"The exertions of Britain during the revolutionary war, are unequalled perhaps in

the annals of any nation. Two hundred sail of line-of-battle ships, a military force of more than half a million of men, near twenty millions sterling paid in loans and subsidies, a public debt, before deemed intolerable, enlarged to a frightful magnitude, and an immense annual taxation doubled: such have been the efforts of a people who had acquired vigour by the wholesome spirit of their ancient institutions, a generous love of liberty, a liberal toleration in respect to religion, the cultivation of manufactures, and an unrestrained commerce.

"No nation ever suffered equal privations with greater manifoldness. The stockholder beheld his capital diminished more than one half, the peasant saw the price of his loaf almost tripled, without a murmur; while the opulent cheerfully yielded to the fiscal regulations known by the detested names of the triple assessment and the income-tax. But enlightened men were shocked at the miseries inflicted by those who reclin'd their heads on pillows of down, while their fellow subjects were frequently arrested on suspicion, confined for months without trial, or tried without crime. It was considered as an intolerable outrage, that the punishment reserved for convicted felons should be applied to unconvicted traitors; and history has to record, without a blush, that solitary imprisonment, for the first time since the revolution, was practised in one country by the express order, and torture inflicted in another by the tacit permission, of Englishmen.

"During the course of this conflict, Britain was victorious in every sea, and successful in every naval battle; the capture of near 500 men-of-war, of which upwards of eighty were ships of the line, fully attests this memorable fact, and exhibits nobler trophies than were ever won before by any other nation. Nor was any quarter of the globe exempt from her conquests. In America, she acquired Tobago, part of St. Domingo, the whole of Martinico, St. Lucia, and Guadeloupe, from the French; Trinidad from the Spaniards; Demerary, Issequibo, Surinam, Curacao, Berbice, and St. Eustatia, from the Dutch. In the East Indies, Pondicherry, Malacca, Ceylon, Amboyna, and Banda, yielded either to her arms or influence. In Africa, Goree, the Cape of Good Hope, Malta, and Egypt, by turns confessed the sway of the conqueror; while in Europe, Toulon, Minorca, Corsica, and Malta, either surrendered by capitulation, or were subjugated by force.

"Scarcely any state in want of treasure or assistance, but was either supplied with the wealth, or protected by the fleets and armies, of this nation; and no less than two emperors, three kings, one queen, with a multitude of petty but independent princes, were occasionally ranked among her subsidiaries.

"In addition to this, and by a rare instance of good fortune hitherto unexampled in any history, although the manufactures of England drooped, and many of her artisans were forced by dire necessity to wield those arms they had before fabricated, yet her commerce flourished and even increased during the war.

"This tide of prosperity, however, has been productive of but little permanent advantage; for after the expenditure of at least one hundred and fifty thousand lives and some hundreds of millions of money, the island of Ceylon in the Indian, and that of Trinidad in the Atlantic ocean, are all that remain of her numerous conquests: nor ought it to be forgotten, that one of her allies has been stripped of his dominions on the continent; another has been driven into exile; and that the rest have consented to the most humiliating sacrifices to obtain safety and peace.

"Ever prepared to avenge insulted honour, or redress national wrongs, it is to be hoped, that Britain will continue to combat by means of the same arms which have so frequently ensured success; and that with the extended trident of Neptune she will, as before, beat down the boasted spear of Minerva.

"But, with these exceptions alone, it is her interest to sacrifice at the altar of peace; to ply the loom and the shuttle; to cultivate the surface of the earth for the purposes of agriculture; to raise the minerals from its bowels for the service of social life; to unbend the sail of commerce to the gale; to cover the ocean with her fleets; and never to engage in any but a just, necessary, and popular war, the aim of which is defined, and the object attainable."

The appendix contains the state-papers which were most necessary to elucidate the narrative: the requisite maps are inserted in their proper places. The whole work will be perused with interest and approbation. No ordinary diligence, no inferior talents, could have so speedily collected, so fitly arranged, so justly estimated, so strikingly compressed, this immense mass of transaction. To the contemporary it will be a favourite book of reference, when he wishes to recall before his memory the leading incidents of that war of the gods, which shook the pillars of surrounding society. To posterity it will prove, that there were Englishmen who saw, while it lasted, the madness of their country's interference, and who opposed in vain the wild counsels of the anti-jacobin furies.

ART. X. *Political and Military Memoirs of Europe, from the Renewal of the War on the Continent in 1798, to the Peace of Amiens in 1802.* By T. E. RITCHIE. 3 vols. 8vo.

SOMETIMES a war is undertaken, in the event of which great interests of mankind are at stake. Such was the war of Darius, the Mede, against the Greeks, which under Xerxes, his successor, was terminated so gloriously for the cause of liberty. In that war probably the Ionian cities, which were the regular subjects of Darius, took a sincere interest in the success of the Greeks. They might not avow it; they may not have betrayed the cause of their sovereign: but they are likely to have felt that every asylum of liberty and independence would be lost to their generation, if the Persians prevailed in the contest. Such again was the war of Gustavus Adolphus; a war as important to religious autonomy, as that of the Greeks to civil. Darius might have defended his invasion on the grounds of the anti-jacobins. The opponents of Gustavus Adolphus might have defended their cause, on the grounds of the English court during the American war. The Persian historians had, no doubt, such grounds to urge formerly; and the imperial historians of Germany latterly: but the European verdict, the judgment of the disinterested states, both in the ancient and in the modern world, has condemned the adherents of Darius, and the opponents of Gustavus Adolphus. The consequence is, that, with the flow of ages, the fame of these adherents and of these opponents is constantly diminishing. They are considered either as ignorant of the true interests of the people, or as knowingly hostile to them; their failings are advertized, their talents are questioned, in order to associate permanent praise with eventual utility, and to render true glory inseparable from virtue.

The late revolution war of the French, or the anti-jacobin war of the confederated kings, was a struggle of this kind when it began: and the leaning of the neutral and disinterested nations to the French cause has continued so decisive, that scarcely any historians are to be met with, and those anonymous, who

throw the interest on the side of the allies. Nor are the natural prejudices of country sufficient to restrain the Posselts and the Stephens from the avowal of an analogous sympathy. We are not therefore about to blame Mr. Ritchie for a turn of opinion somewhat Gallican; we think it, on the contrary, during this struggle for liberty, favourable in a man of letters to the enduring interests of his reputation; yet we could wish that, from the moment of the negotiation at Lille, every thing anti-British had been carefully avoided: from that period the war on the part of the British ministers was only a struggle against French aggrandizement. The alliance with Russia in 1798, is attacked with considerable coarseness of displeasure (p. 37), a sort of mention, which only tends to prepare between two nations, well adapted for habitual friendship, an absurd spirit of angry animosity.

In the second volume the usurpation of Bonaparte is narrated with a complacency highly dangerous to the interests of liberty: we are not for invoking, on such occasions, the poignard of Arena; but we would wish the voice of history to speak daggers to those generals, who, by the instrumentality of an ignorant force, suppress and stifle the infant feebleness of free, voluntary, and improving institutions. The interference of Bonaparte was avowedly despotic, and despotic for the worst of ends: he declared himself an anti-jacobin, the instrument of a party confederated for the suppression of liberal ideas. To \*Sieyes, Barruel, and the other secret directors of the jesuitic interest, he owed the opportunity of elevation, and has kept the implied condition of his ascendancy, by faithfully restoring popery and personal monarchy. It must have been mortifying to the leaders of the anti-jacobins of this country, not to have been consulted about the elevation of that man; because it shows that they were considered only as the instruments of a continental faction, which they

\* Barras and Moulins, who were sound catholics, had smoothed the way for this revolution. It was soon followed by the recall of the whole church and king party. A man of letters, who co-operated in the English Anti-jacobin Review, now manages an official publication for Bonaparte, on similar principles.

fancied they were using against France. They have been lending the treasures and forces of this country, not to resist French aggrandizement, but to subdue France to the holy see. They have triumphed.

The conclusion of this interesting history contains a criticism on the peace of Amiens, very characteristic of the author's patriotism.

“By the conditions of the definitive treaty Bonaparte acquired more, than four years of successful warfare could have given him. Their extreme liberality explains the reason, why the diplomatic correspondence has not transpired. France could not be abashed by giving publicity to the progressive steps of a negotiation, which terminated so beneficially to her; but the exposure of them might not have been a matter of equal indifference to the other contracting party. The court of London wished to get rid of the war at any price, and the first consul, remarking this favourable ardour, was too sagacious not to turn it to his own advantage. It is not enough to disclaim any idea that the peace was concluded under an impression of the over-ruling power of France: the supposition must be disproved by facts, and by them only. If the vigour and resources of Britain were as great, her situation as proud and pre-eminent as ever; if her means of continuing the contest were adequate to every exertion which might have been required, how happens it that concession is the task of Britain alone?—that there appears no mutual interchange, no reciprocation on the side of the republic? Surely, so vast a boon might have procured peace at any time; and if no imperious necessity existed on the part of this country, was it not humiliating, was it not disgraceful to accept of terms which implied it? If the relative attitude of the two states precluded further beneficial hostility, the *uti possidetis* became the rule of negotiation, and that alone, or commensurate renunciations, can be acknowledged as the evidence of equal claims. But an expenditure of nearly three hundred millions, independent of the losses sustained by a restricted commerce, and other evils incident to a state of hostility; a sum which has entailed an increase of annual taxes greater than the real value of the foreign merchandise imported into Britain during the year, and little short of that of her export trade, surely demanded a more equable compensation than the cession of Ceylon and Trinidad. The professed object of the war against Tippoo was the expulsion of Frenchmen from India for ever: but by the treaty of Amiens, Pondicherry and all her former settlements in the east are restored, nay guaranteed to the republic, which thus acquires the means of reviving dangerous intrigues with the native powers, and forming

at her case establishments that will soon expand to an extent fatal to the interests of this country. As a military and commercial station, the Cape of Good Hope was of the first importance: yet this settlement is restored without a struggle. In fine, all the colonies of France in the possession of Britain are given up, after being improved and enriched by the capital and industry of the English merchant, and they are given up without any requital,—except the grant of peace.

“The sanction of terms so degrading, of terms which the vanquished only could be supposed to receive, was a disagreeable duty to the British legislature: it was directly hostile to their proceedings during the last eight years. When their political opponents, on so many former occasions, suggested moderation instead of that contemptuous pride which inflated the incapacity of the war-ministers; when they proposed the acknowledgment of the French republic, and a compromise as to territory by the renunciation of some of her colonies, and the retention of others; Mr. Pitt exclaimed, that he trusted there was not a man to sign such a treaty, and not a courier to carry it. Yet, by a strange fatality, one of his warmest partisans was selected to conclude a peace on less favourable conditions, and officially pronounce its eulogy. At the same time the ex-minister, with incredible effrontery, openly joined in the transaction, but shewed no compunction, and felt no abasement from self-contradiction. In the course of his oration, during the solemn discussion of the treaty in the house of commons, he laughed; and in this playful humour, which incited a corresponding sensation among his friends, were the dearest interests of the nation decided. The Britons, who fell on the plains of Flanders and the sand-hills of Holland, could never have surmised, that their funeral rites would be celebrated with merriment. But as if the history of Mr. Pitt ought to be recorded in Hudibrastic verse only, the man, who can boast of having, by the impolicy of his measures, reared a power whose stupendous strength must soon crush the thrones of the European potentates, is to have a statue erected to immortalise his deserts. Let it be engraven on its pedestal, that the British annals, since the time that a Stuart occupied the throne, afford not an instance of imbecility in the cabinet and the field, or an ignominious result, equal to those in the war against the independence of the French nation, and the liberties of mankind.”

This history is written with an ardour of eloquence which well adapts it for popularity of circulation. It is not distinguished by the consultation of numerous, or foreign, or recondite authorities; but by the natural choice of those objects for prominence, which

made at the time most impression on the generality of observers. The style is spirited and unaffected; but in the use of auxiliaries there are occasional symptoms of a northern education. It is agreeable that events so recent, and

so frequently alluded to, should be retraced on the memory; and that a book of reference should be provided, in which the order and dates of the successive incidents should be easily found.

ART. XI. *The History of France from the Year 1790 to the Peace concluded at Amiens in 1802.* By JOHN ADOLPHUS, Esq. 8vo. 2 vols. pp. 1311.

TO commence this article with any general remarks on the duties of an historian, or on the qualifications of Mr. Adolphus for the laborious and responsible task he has undertaken, were alike superfluous. As to the first, they have long since been agreed on; diligence in exploring every repository wherein information may be obtained, and plain honesty in the communication of it: an historian should take for his motto, "Truth and the whole Truth." As to the second, namely, the qualifications of Mr. Adolphus, he has already delivered his credentials, if we may use the phrase: his *History of the Reign of George the Third* has the rare merit of estimating living characters with freedom and impartiality, and of recording contemporary facts un mutilated and undisguised. "Opinions vary, fade, and are forgotten; applause and blame are transferred from public characters, according to the mutability of general opinion, but the narrative of facts will ever claim attention; and the historian who has bestowed the greatest portion of diligence and judgment on this part of his subject, will be most permanently esteemed." Much has been said on the difficulty of composing an history of our own time; it is obvious, that the principal difficulty is that of restraining within due bounds those prejudices and partialities, which all of us feel with respect to particular measures and particular characters. The materials for history are not likely to be more abundant or authentic at a remote period; no future writer could have had better sources of information on the events of their respective histories than Thucydides, Xenophon, and Cæsar, each of whom could exclaim concerning them—*quæque ipse . . . vidi, & quorum pars magna fui*. As Mr. Adolphus had succeeded in acquitting himself with respectability as the historian of the passing events of his own country, we augured favourably of his success when

the recent occurrences of a foreign nation became the subject of his pen; he now enjoys all the advantages of a contemporary historian, and is in a great measure relieved from those restraints which delicacy and an amiable tenderness towards living characters unite to impose. We shall examine his merits with freedom and impartiality.

These volumes embrace a short but eventful period: they begin with the state of the public mind in France during the summer of the year 1790. The habits of obedience which had long characterized the nation, were universally relaxed, the laws no longer revered, the duties of sovereignty no more regarded. The contagious spirit of revolt had been communicated to the troops, and the garrison of Nancy, openly supported by the jacobin club at Paris, now demanded in so loud and peremptory a tone some arrears which it was asserted were due to them, that the national assembly, foreseeing the dangerous consequences which would ensue were not some vigorous and effective measures immediately adopted, passed a decree on the 16th of August, ordering the soldiers to return to their duty, and the inhabitants of Nancy to their obedience to the laws, under pain of being treated as rebels.

Mr. Adolphus begins his history with an account of the *affair*\* at Nancy, and to our great surprise we found that he had dismissed it in four pages! That an event of such intrinsic importance, one which implicated the humanity of an officer who acted so considerable a part in the revolution, the Marquis de Bouillé, and who, in order to vindicate his character, published in his memoirs a detailed account of the affair, that it should have been thus cursorily glanced at, is perfectly unaccountable. Even the brief and insufficient relation which Mr. Adolphus has given, is not strictly accurate; he says, that after the arrestation of the deputies from Nancy, the

\* This has generally been called the *massacre* at Nancy.—REV.

Marquis de Bouillé was directed to march against the insurgents, that a considerable force was rapidly collected, and that he appeared at the gates of Nancy before the mutineers were informed that he had commenced his march. "His presence produced a momentary awe: the revolted soldiers, on his summons, delivered up Messrs. Malseigne and de Noue; but before the gates could be thrown open, with fatal levity they resumed their arms, and pointed a cannon against the troops which had advanced within thirty paces of the gates."

On a reference to the Marquis's own account of this affair, we find that M. de Malseigne was the officer who was charged with the execution of the decree of the national assembly, and the Marquis merely with a commission to render him every assistance, and employ arms if the insurgents persisted in rebellion. Soon after the passing of this decree, De Bouillé, who had long been commandant of Metz and of the provinces des Evêchés, received an order from the king to take under his command the troops of Lorraine, Alsace, Franche-Comté, and Champagne; these united to the garrison of Metz, formed an army consisting of an hundred and ten battalions, and a hundred and four squadrons. There was reason to suspect, however, that a majority of these troops had not preserved their fidelity to their sovereign. The insurrection at Nancy in the mean time became more alarming; the garrison was composed of four battalions of the king's regiment, accounted one of the best in France; of two battalions of Swiss; and the regiment of mestre de camp, which were cavalry. To these were joined five or six thousand men from the town and neighbourhood, who had opened the arsenals, whence they had taken five thousand musquets, had seized on the powder magazines, and loaded eighteen pieces of cannon. The soldiers had plundered the military chest; exacted money of the constituted authorities, under pain of hanging the municipal officers and commissioners for the department, in case of refusal; and had actually imprisoned several of their officers, and among others the general officer that commanded them.

Such was the situation in which M. de Malseigne found Nancy; it is not to be wondered at, therefore, that the decree of the assembly should be treated

with derision, and that the officer who proclaimed it was glad to escape from an attempt made to seize him, to Luneville; where there was a body of carbineers, consisting of eight squadrons, who had hitherto conformed to military duty.

The garrison at Nancy, enraged at the escape of Malseigne, proceeded in martial order to Luneville, for the purpose of compelling the carbineers to deliver him into their hands. This outrage on the person of a brother officer, who had been expressly appointed by the national assembly to proclaim and enforce its decree, first prompted the Marquis to assemble some troops and march against Nancy. The carbineers refused to deliver up Malseigne, and a slight engagement ensued between the two parties; the very next day, however, these fickle cowards arrested their general, and sent him under an escort to Nancy, where the soldiers of the garrison threw him into prison. Information of this latter circumstance decided the Marquis to attempt a rescue, though under considerable apprehension of disobedience among his own troops, which consisted, moreover, only of three thousand infantry and fourteen hundred cavalry, while the town of Nancy contained no less than ten thousand men in arms. Preferring, on the score of prudence as well as of humanity, persuasion to hostility, on the morning of the 30th of August the Marquis introduced a proclamation into the town, commanding the people to conform to the decrees of the assembly, and deliver up the most factious of their chiefs; four and twenty hours were allowed them to prepare an answer. After some ineffectual negotiations between the parties, the Marquis begun his march: he had proceeded within half a league of the town, when he was met by a deputation, to whose proposals he gave the same answer as before, allowing an hour for decision: this hour expired; and at four o'clock in the afternoon his advanced guard approached the gates of the town, which were defended by troops and armed inhabitants with several pieces of cannon. Within a few paces from one of these gates, another deputation advanced from the town, who assured the Marquis that his orders should be instantly obeyed, that the regiments were already leaving the town, and repairing to the place he had appointed, and that the two general

officers would immediately be delivered up. Accordingly, the head of the column, into which the king's regiment was formed, filed off from the town, and the Marquis was soon joined by the two generals, Malscigne and De Noue. In consequence of this pacific arrangement, the Marquis suspended the march of his troops, and waited only for the departure of the garrison, that he might take possession of it himself; it often happens, however, that the irritation of a populace is not to be controuled; such unhappily was the case at present.—Several soldiers, who had not followed their colours, together with a party of the people, began a quarrel with De Bouillé's advanced guard, and were preparing to fire on them with several pieces of heavy ordnance, loaden with grape-shot, which they had placed in the entrance of the gate. A young officer of the king's regiment, named Dessiles, prevented them for some time; he placed himself before the mouth of a cannon, and when torn from thence, he leaped upon a four and twenty pounder, and seating himself upon the touch-hole, was in that position massacred.\* The dreadful slaughter which followed is too well known to require being detailed here. We have dwelt on this affair, in justification of the Marquis, from whose memoirs of the revolution our account is abbreviated, because we think that Mr. Adolphus has slurred it over in a very hasty and unsatisfactory manner.

In the account of the king's flight to Varennes, it is said that "M. de Bouillé, who had escaped from France, wrote to the assembly, avowing himself the only instigator of the journey." Mr. Adolphus does not seem to have been aware, that so far from being the author of the king's flight, de Bouillé, when the project was first communicated to him, instantly saw, with that ready penetration and sagacity which seldom deserted him, the very doubtful success of the measure, and the inevitable ruin both to the sovereign and the monarchy which a failure would produce: it was decided on against his approbation, but the decision being made, he obeyed his orders, and was the sole conductor of it. The Marquis made his own escape; and on his

arrival at Luxembourg wrote a letter to the national assembly, which may have misled Mr. Adolphus, accusing himself as being the person who persuaded the king into the measures he adopted. The object of this letter does the highest honor to the Marquis; "it was intended," says he, "for no other purpose than to turn upon myself that torrent of popular fury which I feared might prove fatal to the king and the royal family." See *Bouille's Memoirs*.

Proceeding in the history to the fatal summer of 1792, and the events of the 10th of August, and the 2d, 3d, and 4th of September, it is necessary to draw the characters of parties and of individuals. So difficult is it to form a fair estimate of these, from the prejudiced sources of hired journalists and interested emigrants, that where our opinion on the merits of an individual has not coincided with that of Mr. Adolphus, we are far from inferring the inaccuracy of his estimate. Our reading on the events of the revolution has been casual, and in comparison with his confined; Mr. Adolphus, who is a cautious and industrious historian, has nevertheless occasionally summed up his evidence without a careful examination of witnesses. We were a little shocked to find him favouring the suspicion of Roland's agency in the massacre of September: we had always looked upon Roland as an honest and respectable character, and Mr. Adolphus surely is not perfectly consistent with himself on this subject. In one page he represents this minister as an "inoffensive old man, endowed with little talent and not much malice, choleric, not rancorous, plain in manners and habits, brief in speech, fond of reproving vice, and fancying himself a model of virtue." By and bye it is stated, that "he made no vigorous representation against these massacres, because he rejoiced at the extermination of priests and nobles;" that he afterwards denounced the massacres of September is certainly no positive proof that he was not concerned in them; but as the murder of Roland himself was believed to have formed part of the projet of the 2d September, (see vol. 1, p. 266) he cannot be exposed to the suspicion of being con-

\* In a note to Mr. Adolphus's inadequate narrative of this affair, he tells us, that Dessiles survived "to enjoy the immediate admiration of his country, and to attest afterwards in exile her ingratitude!" Our account of this noble instance of heroism is taken verbatim from the Marquis de Bouillé's *Memoirs*.—REV.

cerned in it. The character of Madame Roland is drawn with great severity, and we cannot but observe in general, that republicanism is a crime which Mr. Adolphus cannot regard with any tolerable complacency. The king's friends are 'all honourable men:' we remember that the Marquis de Bouillé acknowledges himself to have detested the constitution at the time when he swore to support it; and on his own confession also, (see p. 291 of his very interesting memoirs) that he took a solemn oath before Almighty God, in compliment to the king, and with a premeditated intention not to keep it one moment longer than his majesty! Conscious of an insincerity to which, in our opinion, was attached no common guilt, it is but natural that he should regard every one as the spy and suspect of his conduct. To be haunted by suspicion, is the wise and salutary punishment inflicted by the GOD OF TRUTH on such as meditate the slightest profanation of his sacred altar. Afterwards, in consequence perhaps of a natural and well-founded suspicion of the sincerity of the king, and of the king's friends, many voted for the abolition of royalty, who but for a different conduct on their part might possibly have been induced to have given a different vote. But to have voted for the abolition of royalty is enough; and we find the learned and respectable Bishop of Blois, so well known for his concurrence with those clergymen in the sitting of the *Etats Généraux*, who united themselves with the *Tiers Etats* in opposition to the design of allotting separate chambers for the two superior orders; so well known for his activity in the first national assembly, as a reformer of clerical abuses; so well known for his eloquent speeches and motions in favour of the emancipation of African slaves; so well known for his beautiful pamphlet entitled "a Preservative against Schism;" and so well known for his *encyclie*, his circular letter to the bishops of France, requiring their aid in the convocation of a national council, for the purpose of restoring the clergy, according to the decrees of the council of Trent, the synod of Borromeo, and the liberties and independence of the gallican church; we find this gentleman represented as "vying in ribaldry and blasphemy" with Lindet, Coupé, Villiers, &c. on the 7th of November 1793, at a sitting of the national con-

vention, headed by Gobet, constitutional Bishop of Paris, where they rejected their clerical functions; and at which very sitting Gregoire, in a declaration full of zeal, asserted his christianity and scrupulous adherence to the faith of his forefathers! (See Mem. of the Founders of the F. R. art. *Gregoires*, vol. 1.) But it is time we should give our readers a specimen of the style in which this work is composed. After a concise but clear and connected account of the campaign in 1791, Mr. Adolphus turns his attention to the internal state of the republic.

"From these scenes of carnage, where the horrors of death are diminished by the 'pride, pomp, and circumstance of glorious war,' the attention is called to contemplate transactions not less sanguinary, though infinitely more disgusting, exhibited in the internal government of France. Terror, avowed as a system, stalked over the land, dealing on every side the blow of fate; and extinguishing love, mutual confidence, honour, and pity. The various devices for proving treason, or treasonable inclinations, gave vigour to a host of spies, informers, and persecutors, some of whom were in the pay of government; some hoped to conciliate favour, and others thought, by denouncing their nearest relations or most intimate friends, to avoid those persecutions, of which a moment might make them the victims.—No man could consider himself sure of an hour's life, yet no man was permitted to prepare himself for death; and he who dared to express or inculcate a hope of a better existence beyond the grave, incurred imminent danger of being sacrificed as an incorrigible fanatic.

"Yet no motive of safety, or hope of advantage, stimulated the rulers of France to so profuse a waste of human blood: no formal opposition to their ascendancy existed in the convention, nor could insurrection venture to lift her head in any of the departments. At an early period of the year Charette was expelled from the isle of Noirmoutier, and the last hopes of the royalists seemed to have expired: but the termination of fear did not terminate the vengeance of government; every inhabited place of La Vendée, and every district presumed accessory to the insurrection, was a monument of blood and insatiate revenge. The deputies sent on mission to these parts were purposely selected from the most barbarous, ferocious, and brutal of the people: they carried to exaggeration the fashionable manners of the cordeliers, adding to the disgusting deportment, obscene diction, and unrelenting cruelty, required by the prevailing disposition in Paris, all the violences which an unbridled indulgence in the worst and most detestable passions could prompt, or

the most diabolical imaginations could invent. Carrier was the delegated tyrant of La Vendée, and he raised to his name monuments of horrible celebrity, before which the barbarians of all times and nations but his own seem comparatively innocent. He publicly excited the people to pillage and murder the rich; he publicly reproached the judges for permitting scruples of any kind to prevent the condemnation of criminals; he mingled with his cruelty and extortion a brutal jocularly, not less afflictive to the mind than pain was to the body of the sufferer; he dismissed petitioners who pleaded for their friends or relatives, with reproaches, threats, and even blows; the consequence of these barbarities was universal dread, general desolation, and in individuals the mental agony often occasioned delirium and death. An instance is even recorded where the executioner was so affected with the innocence and graces of six young ladies perishing on the same day under his hands, that he was seized with a profound melancholy, which terminated his existence in a week. Yet the directors of these barbarities were not merely unmoved, but satisfied with themselves. Carrier boasted of his cruelties; his dispatches to the convention were filled with accounts of destroying five hundred in a day, of burying four thousand and fifty in a single pit, and the convention applauded these ferocious narratives, enjoying as excellent wit the description of the guillotine under the name of the national razor, and the little window, and the noyade, by the title of the bath, and of drinking in the great bowl.

"But even these excesses were not equal to those by which the commanders of troops of the revolutionary army spread terror and devastation far and wide. Their savage atrocities combined the extremes of rapacity, cruelty, and lust: by them whole generations were swept away in brutal sport; the hoary grandsire, with the youthful props of his years, and his second hope the offspring of his children, lay in one general heap; women even in pregnancy, and children at the breast, were devoted to similar destruction. Priests, women, and children, were marked out for peculiar barbarities: priests were the first victims of the noyade, being put on board boats and ships under pretence of transportation; but when they were drowned, Carrier amused the legislature with a joke in his own style, that they were transported *vertically*; the unfortunate men, ignorant that they were destined to this unexpected death, cried out to their executioners for help, but their struggles and exclamations only occasioned mirth in these monsters, and if any were perceived making such exertions as promised to save their lives, they were dispatched with swords, poles, or pikes."

The second volume opens with an account of the effect produced on the internal state of France, by the decapitation of Robespierre: the jacobin club was soon dissolved, but individuals yet retained great influence, and one system of terror was only abolished to make room for a new one. In the year 1795, the arms of the republic triumphed in every quarter: Tuscany, Spain, Prussia, the Landgrave of Hesse, and the Elector of Hanover, are driven into peace, and Holland into a fatal alliance. The second insurrection of La Vendée is quelled by the artifices and the arms of Hoche; the disgraceful expedition to Quiberon fails, and Charette and Stofflet are executed; the national convention proceeds to frame a new constitution; the infamous decree, however, for electing two thirds of the new councils from the convention, is strongly opposed by the people; preparations are made for resistance; insurrection ensues; the cannon of the convention sweep the streets and quell the insurgents: the elections are of course completed, and the convention is dissolved.

"The general abstract of the acts of the convention, and the effects of its existence, is thus detailed by Prud'homme.\* Its sittings continued thirty-seven months and four days, during which time 11,210 laws were enacted, and 360 conspiracies and 140 insurrections denounced: 18,613 persons were put to death by the guillotine. The civil war at Lyons cost 31,200 men; that at Marseilles 729. At Toulon 14,325 were destroyed; and in the re-actions in the south, after the fall of Robespierre, 750 individuals perished. The war in La Vendée is computed to have caused the destruction of 900,000 men, and more than 20,000 dwellings. Impressed with images of terror, 4790 persons committed suicide; and 3400 women died in consequence of premature deliveries: 20,000 are computed to have died of famine, and 1550 were driven to insanity. In the colonies 124,000 white men, women, and children, and 60,000 people of colour were massacred; 2 towns, and 3200 habitations were burnt. The loss of men in the war is estimated, though probably below the real truth, at 800,000; while 123,739, who had emigrated in the course of the revolution, were now for ever excluded from the country."

The narrative of the internal state of the republic is now suspended, whilst the historian relates the brilliant and depopulating campaigns in Germany

\* Histoire des Erreurs, &c. vol. vi. p. 512; and Tableau Général.

and Italy. These numerous and splendid conquests, whatever gratification they afforded to the national vanity of the French, were attended with little internal advantage; the plunder of other countries enriched not their own, whilst so many thousand hands were taken from agriculture and manufactures to supply the ranks, at once of victory and death.

The history of Bonaparte's campaign in Italy, was written at the time by a general officer. We remember an anecdote there related, which, *in honour of the Venetian senate*, we shall repeat: "A few days before General Massena had taken possession of Verona, that place was the asylum of Lewis Stanislaus, brother to the last king of France, and his little court of emigrants, to whom the Venetians had kindly afforded protection. Their generosity, however, soon gave way to their fears; and the senate of Venice, with a shameful policy, had already determined to transfer to the victorious Bonaparte all the regard it had formerly displayed towards the majesty of the *king of Verona*. The *podestat* accordingly received orders to declare to this fugitive prince, that it was necessary for him to leave its territories, although when France had formerly thought proper to complain of this reception, the senate had answered, that Lewis being a noble Venetian, in that quality had a legal title to inhabit the dominions of the state; but the republican legions had not at that time crossed the mountains. By way of reply to this embassy of the *podestat*, the *pretender* is said to have demanded that the golden book, containing the list of the nobles, should be sent to him, in order to erase the name of his family, and he at the same time required the sword which his ancestor Henry IV. had presented to the republic. The magistrate, without any respect to the misfortunes and past grandeur of the *pretender*, replied, that the senate, on his demand, would make no scruple to grant the exclusion of his name; and as to the sword, *it should be instantly restored, provided he would pay the sum of twelve millions of livres still due by this same Henry*; "an answer," observes the historian indignantly, "indecent on the part of the government of which he was the organ, and only worthy of a

pawnbroker." To return to Mr. Adolphus. In the account which is given of the most foul, infamous, and diabolical invasion of Switzerland; which account, from the list of references, is unquestionably drawn from the most authentic sources, it will scarcely be credited, that the name of that immortal patriot, ALOYS REDING, is not once mentioned, no not once! Has Mr. Adolphus never heard of such a man? does not he recollect some such name in the *Histoire de la Destruction, &c. par Henri Zschokke*? what an extraordinary and unaccountable omission then! The French would not have had so easy a conquest over the Swiss, had half that boasted happiness and harmony subsisted among them, of which we have heard so much: their history abounds with instances of intestine discord, arising from civil jealousies and religious intolerance. The Helvetic confederacy, incoherent in its parts, had long been threatened with dissolution: "different kinds of intestine disturbance," says Mr. Zschokke, whose narrative is written in a very temperate and careful manner,\* "different kinds of intestine disturbance," says he, "the remonstrances of the governed, the blind haughtiness of the governors, the mutual rivalry between the cantons, all united in the work of destruction.—France, seeing with pleasure the dissensions which tore the confederates, did not delay to profit by them; she fomented the discord, fed the hatred and the hopes of parties, excited the cantons against each other, and thus made way for the revolution in Helvetia which was soon to break out."

Berne, Zurich, and Basil took an early alarm, and Zurich, the first canton of the Helvetic league, invited them to a conference for the purpose of mutual co-operation and protection; Schwitz acceded to the confederacy, and sent to the canton of Berne, in quality of its deputy, the ancient landamman, Charles Reding, with the view of preserving, by conciliatory means, the tranquillity of that canton, and of the whole Helvetic body.

Berne, "on which the salvation of Switzerland depended," says Mr. Adolphus, although it appears that Schwitz, under Aloys Reding, made the stoutest and most heroic resistance; Berne was

\* A translation of it has been lately published, from which we have taken the liberty of copying the paragraph marked with inverted commas.—REV.

governed by a proud and unbending aristocracy, who had excited disaffection among the Vaudois by the invasion of those franchises which they had enjoyed from time immemorial. The Vaudois demanded their ancient privileges; Berne irritated them by her refusal: violence produced violence; France fomented the discord, assumed the right of mediation by virtue of ancient treaties, and declared by the mouth of Mengaud, her chargé d'affaires with the Helvetic body, that she would render Berne responsible for the life and safety of certain persons, whom the government had imprisoned for the freedom with which they had pleaded the cause of liberty and equality. Berne, in order to ward off the immediate blow, *now* found it necessary to adopt conciliatory measures towards the Vaudois, and accordingly sent two deputies of the diet, Wiss of Zurich, and Reding of Schwitz, to the Pays de Vaud, with instructions to restore order, even at the expence of the greatest sacrifices, provided however that they were asked in a legal and proper manner. The haughty spirit of an individual, who is the object of extravagant and repeated encomium by Mr. Adolphus, the avoyer Steiguer, who was at the head of the Bernese government, frustrated this salutary measure: the deputies arrived at Lausanne, the capital of the Pays de Vaud, and were on the very point of executing their commission with success, when Berne, *on which the salvation of Switzerland depended*, learning that there were still in the Pays de Vaud many communities which remained faithful to its government, resolved to make use of them in conquering the country. To perseverance in this fatal, and we do not hesitate to call it, this treacherous measure, she was urged by the unyielding Steiguer, who suffered his hatred to the new organization of France to get the better of that political prudence, for which he had before been so justly celebrated. Insurrection increased, and general Menard entered the Pays de Vaud on the 25th of January 1798, at the head of his column. The haughty governors of Berne now trembled, and from their fears were extorted concessions at which their pride had revolted: but it was too late; at length, reduced to despair, Berne invoked the succour of all its allies, but they were too busied in their own concerns, and the cantons of Zurich and Schwitz alone

sent each a battalion, the latter of which was commanded by the great patriot Aloys Reding; who, in the course of the struggle, became the soul of the allied army, but whose name Mr. Adolphus has not thought worthy of being admitted into his pages.

As the history comes nearer to the present time, we have scarcely any thing before us but scenes of battle. From the campaigns of Italy the reader is carried to those of Germany, of Holland, and of Egypt; and the wretched relief which alone is in the power of the historian to offer him, is a view of the divisions in the directory, and of the alternate ascendancy of different factions in Paris. These divisions, however, which kept the Parisians in such constant personal alarm, are in a moment hushed by the bold and dexterous revolution at St. Cloud; and certainly nothing refutes the slander of the capriciousness of fortune more decisively, than her constancy towards Bonaparte on this occasion: that a general should have basely abandoned his army in distress, without orders from his government: that he should return to his country, and not merely escape punishment for his defection, but be raised to the supremacy of power, was a most extraordinary and incalculable circumstance. The history of this revolution, and the facilities which were offered for its accomplishment by the state of the nation, at this critical time, are explained with perspicuity and spirit.

Bonaparte had not been long seated on his consular throne, before he quitted the metropolis, in order by his presence to give the campaign in Italy a decisive and favourable issue. On this occasion it was, that he performed an achievement which rivals, if it does not eclipse the famed exploit of Hannibal: with his army of reserve, encumbered with heavy artillery, he crossed the Great St. Bernard.

The battle of Marengo, the success of which Mr. Adolphus has justly attributed to the unfortunate Dessaix, decided the campaign. Within a few months a congress was held at Luneville, where preliminary articles of peace were arranged, which were afterwards definitively ratified by the Imperial diet.

France now foreseeing that England would soon be her only active enemy, endeavoured to countervail the ascend-

ency of our naval power, by exciting the northern powers to a confederacy against us, in consequence of our detention and search of neutral vessels.—

\*The battle of Copenhagen, however, destroyed the hopes of our enemies, and Lord St. Helens was deputed ambassador to Petersburg, for the final arrangement of all disputes between the contending nations. After several naval successes on our part, means were pursued for reconciling Great Britain and France, and a correspondence on this subject was maintained through the medium of M. Otto. Peace, however, was not to be attained, until the success of an expedition sent from England to attempt the expulsion of the French from their unjust possession of Egypt, should be decided. With the account of this campaign in Egypt, so glorious to the British arms, the history of Mr. Adolphus terminates.

Although we think it altogether a respectable work, it does not seem to flow from that philosophic mind which, not satisfied with the barren detail of events, loves to explore their causes, and pursue their consequences. Mr. Adolphus rarely indulges himself in reflections of this sort, and he very often degenerates into a mere journalist: military operations are generally related with precision and distinctness, and they occupy a great portion of these volumes. The omission of all state papers is unpardonable: instead of being referred to Debrett's Collection, or Rivington's Register, we ought to have had Louis's letter to his foreign ambassadors before our eyes, the treaty of Pilnitz should have been inserted, and if Lord Hood's proclamation to, and treaty with the Toulonese had been given at length, we should probably have not felt such emotions of

unmingled triumph; as the narrative of our historian is calculated to inspire. (See our review of Rose's History of the Naval War, in the former vol. of our Review.) Some interesting events in the revolution are too hastily passed over: the queen's trial and execution are hurried over in less than four pages, and those of the king are related in a very meagre manner. When we read a history, we consider the references at the bottom of the page as mere vouchers for the fidelity of the historian: here they must often be consulted for that information which ought to have been extracted from them. An index to the work is a desideratum.

In a short introduction to these volumes, Mr. Adolphus adverts to the various causes, many too remote and fantastic, as he properly observes, to merit attention, which have been suggested by different writers as bringing about the French revolution. He conceives that its origin, character, and progress may, with the smallest probability of error, be ascribed to a faction long nourished in the academies and cities of France, and other continental dominions, connected with numerous societies through all parts of Europe, meditating a total change in manners, laws, and the course of public worship, and projecting an entirely new distribution of power among nations, with a general overthrow of all established authorities. For the existence of such a sect, we are gravely referred to the reveries, the *agrisomnia*, of Barruel and Robison. Many causes unquestionably concurred to produce this mighty event; but instead of enumerating among them the intrigues of sophists and illuminati, we are rather disposed to state the intolerable and accumulating weight of taxes, the disor-

\* Since the publication of Mr. Adolphus's History, a convention has been agreed on relative to this subject, between his Britannic Majesty and the King of Sweden, signed by their respective plenipotentiaries at London, July 25, 1803. This convention, which is a very important one, is comprehended in four articles: The first states, that in the event of one of the contracting parties being neutral during a war in which the other may be belligerent, the vessels of the neutral party shall not carry to the enemy of the belligerent party money, arms, or any instruments of war, or ships of war and guard-ships, nor any manufactured articles immediately serving for the equipment of the same. The second article states, that the cruisers of the belligerent power shall exercise the right of bringing in the ships of the neutral power, going to the ports of an enemy, laden with cargoes of provisions, or with cargoes of pitch, tar, hemp, and generally all unmanufactured articles whatever, serving for the equipment of ships of all descriptions, and likewise all unmanufactured articles serving for the equipment of merchant vessels, (herrings, iron in bars, steel, rose copper, brass and brass wire, deal, planks, not being oak, and spars however excepted;) and if the cargoes so exported in the bottoms of the neutral power are the produce of the territories of the said neutral power, and going on account of the subject thereof, shall have the right of pre-emption. These are the two most material articles.—REV.

dered state of the finances, and consequent depreciation of public credit, together with the insolence, profligacy, and corruption of a beggarly and contemptible nobility, as the immediate causes of the revolution. These causes are enlarged on in an excellent introductory chapter to the memoirs of the Count de Puisaye, written by himself, a work which we are surprised has not yet been translated into English.

M. de Puisaye, who is an excellent authority on this subject, speaking of the state of France before the revolution, says, that whilst luxury, with its wonted rapidity, made such alarming progress, and whilst the necessities of kings were increased by the cupidity of courtiers, the court became a public auction, where every thing was bid for with money, and nobility itself was exposed to sale; sometimes the price was openly fixed, sometimes, (we are translating the count's words,) for decency's sake, certain offices were attached to it, which seldom however required the performance of any duties, and each of these offices had its own *tarif*; to some was attached nobility, purely personal, to others hereditary nobility: this latter was only conferred after the office had been retained a certain number of years, or after it had descended through several generations; there were some adapted to every purse, and every taste, according to the wealth or the vanity of the candidates: they who had acquired, well or ill was immaterial, a certain sum of money, hurried to that aspiring pageant which was dignified with the title of the administration of finance; there they received an exchange—a piece of parchment, and quitted the class of the people, in order to be enrolled among the nobility, generally indeed disdained by the one, and despised by the other.

Having once proceeded thus far, money became a substitute for every thing, and the consequence and pretensions of a man were to be measured by the length of his purse. This vast increase of new nobles was a deadly blow to the state; but as the effect which was expected from the humiliation of the nobility was immediate, and the evils which would thence result, if perceived at all, considered as remote, the present was preferred to the future, and it was thought sufficient to appease the rising discontents by distinction of opinion; hence a multitude of the most insignificant and

puerile distinctions, such as the *ennoblis*, nobles gentilshommes, noblesse d'épée, noblesse de charges, de robe, &c. But the most important difference, continues the count, was that between ancient and modern titles: the wealthy no longer contented themselves with a rank which all these distinctions had contributed to discredit, they must have antiquity, and antiquity also was to be sold!—Ancestry might be purchased: families reduced to poverty, disposed of their titles for money, they had only to change their baptismal name. Genealogies were bargained for like land; fictitious titles defied the scrutiny of the most skilful examiners; or should all these resources fail them, the court distributed its *dispensations*, and those families which yesterday were new, became ancient to-morrow *PAR ORDRE*.

The remark has at all times been made, that when empires are on the decline, vanity seeks to hide its weakness under pompous appellations, the miserable substitutes of real excellencies: it has received an ample satisfaction here! Titles of noble dignity were lavished with so ridiculous a prodigality, that a man might fit himself with a title, as he would with a coat; and it may be asserted, without much fear of contradiction, that the system of equality, that social malady which confounds all ranks, first made its trial in France on the order of nobility. The introduction of commerce into France, was also the epoch of a memorable revolution in the condition of that class, who bear the name of the people. Instruction succeeded to ignorance: *this* took refuge in that order, from whom commerce was interdicted, and *that* became the lot of others who pursued it. The real advantages which the two first orders had enjoyed, now glided imperceptibly into the hands of a third, whilst the former reserved for themselves advantages, brilliant and useful indeed, but adventitious. The necessities of luxury were continually withdrawing from one side and supplying the other; the one employed itself in consuming, and the other in acquiring.

To seek for remote and mysterious causes, when plain and immediate ones are sufficient to account for an event, is not very philosophical. We do not mean to deny *in toto* the influence of the writings of *individual* speculative philosophers, in bringing about the revolu-

tion: but to have recourse to *clubs* and *societies* of infidels and anarchists, in order to account for it, does appear unnecessary; and if Mr. Adolphus, and those who think with him on this subject, had

read the able work of Mounier,\* we are inclined to believe that he and they would themselves be surprised at their own credulity.

ART. XII. *The Political and Confidential Correspondence of Lewis XVI. with Observations on each Letter.* By HELEN MARIA WILLIAMS. 8vo. 3 vols. pp. about 320 in each volume.

THESE three volumes are unusually gratifying. The private confidential correspondence of any man of talent has a value. That of a man connected with the leading characters of his age, and the pivot of events, to which his commentary relates, is still more curious. When to both these sources of interest are super-added the sympathies of the heart, an extraordinary solicitude must be felt in behalf of a writer, whom his suavity of nature and his pre-eminence in misfortune, no less than the established superstitions of rank, contribute to endear to our affections.

From a note in the third volume (p. 163) it appears that the French editor of this correspondence had been commissioned by the minister Roland to examine the papers of Lewis XVI. (which were deposited at his office after being seized at the Tuileries, on the tenth of August) and to fit the more interesting portion of them for publication. The papers themselves offer, for the most part, a convincing internal evidence of their authenticity; and betray few marks of being garbled or inflected. Yet the letters, previous to the revolution, appear written with less talent than those during the revolution; and so many of them display the refinements and artifices of composition, that one cannot help suspecting a private secretary of Lewis to have drawn up the greater part of these letters; although, from motives of politeness or propriety, they were perhaps transcribed by the king's own hand.

In the first volume are chiefly contained letters previous to the revolutionary period, which display much the personal and natural character of the monarch. In the second volume are those which relate to the more stormy periods of his public and political life; these letters have not so unaffected, uninspired, undictated an appearance as the earlier. They display a sagacity and

penetration, which the personal conduct of the writer was far from realising. They mention living individuals, whom there may be many motives for helping up or down in reputation: and are therefore not unlikely to have been partially interpolated. They resemble in character of style and opinion the annals of Bertrand de Moleville. These circumstances somewhat tend to invalidate (as the theologians would phrase it,) not their authenticity but their genuineness, not their emanating from the hand but from the head of Lewis. In the third volume occur many essays, maxims, and other original compositions, the amusements of the monarch's leisure: these again are surely inferior to the demi-official letters of the second volume.

A letter, characteristic of the king's humanity, is the seventeenth: it is accompanied, as is each groupe of letters, with a commentary by the translator.

“ TO M. BERTHIER, INTENDANT OF PARIS.

“ *Paris, October 28, 1781.*

“ You have presented to my council of state a plan dictated by the purest philanthropy; and I approve highly the means you suggest of extirpating mendicancy from my states. To render the poor useful without increasing their misfortunes, to establish places of retreat with humane regulations, and under wise direction, where the love of labour shall be encouraged, where active youth shall be occupied, and infirm old age comforted, such are the motives, and such the aim, of your project. The *corvée* is abolished: but the highways require continual and expensive repairs: might not your hospitals of mendicants furnish workmen to mend and construct roads? I see whole armies of pioneers formed in these asylums, scouring the country, and stationed on the high-ways, where they will provide against accidents, and the ravages of the seasons, and maintain a free circulation throughout all France. You seem to me, however, not to have paid sufficient attention to the means the least burdensome to the people, of furnishing what

\* De l'influence attribuée aux philosophes, aux francs-maçons & aux illuminés sur la révolution de France.

is necessary for the support of your establishments in favor of mendicity. The people are already too much oppressed by taxes: must their burdens be so increased as to render unavailing the benefit of the abolition of the *corvée*? Let us make choice of the mode the least expensive, the most agreeable to the people, and by which the ends you propose can be accomplished, of disburdening those who pay taxes, rendering the poor useful, and keeping the roads in good repair. Your abilities, sir, will no doubt furnish you with new means; and be assured I shall second them in my council.

LEWIS.

“OBSERVATIONS ON THE XVIIIth LETTER.

“While the king applauds M. Berthier for his projects of rooting out mendicity from the state, he observes to him with great justice, that this benefit ought not to be conferred at the expence of the public. Under the old *régime*, it was only by making beggars contribute to the common stock by their labours, that this scourge could be removed from society: but, whether the mode of making them work on the high-roads was the best mean of effecting this good intention, is very doubtful. Beggars are seldom industrious; and the earnings of their labour could scarcely have rewarded the time of their overseers. The revolution has provided in another mode for this once numerous portion of the people, the condition of the poorer classes being so ameliorated as to render mendicity scarcely any longer the object of legislative attention. This letter serves, however, to prove how great an interest the king felt in the fate of the lowest orders of his subjects, and that his mind was continually occupied in purposes of doing good.

“M. Berthier’s philanthropy, though praised by the king, was far differently understood by those who were the objects of his solicitude. He was one among the few persons who were sacrificed to the fury of the populace in the very first days of the revolution. The crime imputed to him was that of monopolising corn destined for the capital, which act has never been disproved: but his death was attended by circumstances of barbarity which would disgrace the least civilised nation.”

A letter, characteristic of a mind reverting from infidelity to credulity is the forty-first, which shortly succeeded his arrestation on the elopement to Montmedi.

“TO THE ARCHBISHOP OF ARLES.

“June 29, 1791.

“To console the most unfortunate of kings, you recall, my lord archbishop, the example of David, compelled to flee before his son Absalom. Forsaken monarch, unfortunate father! it is not vengeance that

David calls to his aid; it is not the thunderbolt of irritated heaven that he invokes; in the king of kings he places all his confidence. He prays for an ungrateful son; he pardons the monster by whom he is pursued, and who seems to thirst for his blood. This act of paternal affection is sublime; and I glory in having a conformity of sentiments and ideas with David: Persecuted by ungrateful children, who calumniate a tender father, I have only thought of their interests and their happiness. At the feet of religion I depose the injuries heaped upon the monarch: may the people be happy! and I am satisfied. I enjoy a soothing satisfaction, while, in my hours of solitude, I can bless Providence, and submit myself to its decrees: it is then that all injuries, all injustice, all wrongs are forgotten. Am I not too happy, my lord archbishop? and can divine justice be satisfied? I have been punished for having preferred that insolent philosophy, which had seduced, and plunged me into an abyss of misery: for that, I neglected the ancient worship of my forefathers, so dear to St. Lewis, from whom I am proud of descending. You, my lord archbishop, whose religious virtues inspire admiration, and who prefer them to those of which philosophers are proud, but which, viewed through the prism of religion, bear so near a resemblance to vices, offer for your unfortunate king the vows of a heart inflamed by divine love—of a holy bishop whom I may compare to Ambrose—with this difference, that Theodosius humbled himself before him for having cruelly chastised a rebellious people, and I solicit the aid of your prayers, to bring back a people who will never have to reproach me with having caused either their blood or tears to flow.

“LEWIS.”

The marginal observations of Louis XVI. on that memoir of Turgot’s, which, in fact, founded the revolution, and is at this time still inflecting toward itself the new as it did the old authorities, would be very curious were it certainly original; but it has the appearance of being the marginal refutation of some posterior ministry, laid before the king in order to detach him from projects of reform, to which he had previously lent an ear. We shall, however, extract it.

“Marginal Observations of Lewis the XVIth, on a Note of M. Turgot, relative to Administration.——1776.

“To ascertain if it be proper to establish municipalities,” says M. Turgot, “if it be expedient to bring to perfection, or change, those already existing, and what form of constitution to give to those that it may be deemed necessary to create, it is not sufficient that we turn back to the origin of those municipal administrations.—The custom of deciding what is to be done from the researches

and example of what our ancestors have done in times which we ourselves allow to have been those of ignorance and barbarism, has too much prevailed in affairs of moment. — This method tends to excite in princes a disgust of their most important functions, by persuading them, that, in order to discharge their duties with usefulness and glory, it is requisite to possess extensive information.'

*"Remarks of Lewis XVI.*

"No great sagacity is necessary to judge that the present note is calculated to establish a new form of government in France, and to depreciate its ancient institutions, which the author supposes to be the produce of ages of ignorance and barbarism; as if the reigns of my last three predecessors could be considered, by just and reasonable minds, among those of barbarous ages; or as if my kingdom were not indebted to those three reigns for the tone and rank it holds in Europe. Europe will not readily be persuaded that those three reigns were those of barbarism and ignorance; she will more easily believe that she owes in part to those three reigns the civilization she now enjoys.

"You will be able, Sire," continues M. Turgot, 'to govern, like God, by general laws, if the integral parts of your empire were regularly organised, and connected with each other.'

*"Remark of Lewis XVI.*

"Most probably, on the contrary, if the organization of my provinces were alike, it would be a reason for not being obeyed, or for being ill obeyed; since it would be much more difficult to set at once in motion a whole mass, than to move it, as my ancestors have done, by intendants and state-provincial assemblies.

"The cause of the evil,' says M. Turgot, 'is that your nation, Sire, has no constitution.'

*"Remark of Lewis XVI.*

"This is the great grievance of M. Turgot: the lovers of novelty must have a France more than English.

"Some of your provinces have, however, a constitution, assemblies," says M. Turgot, 'a sort of public voice: such are the provincial assemblies; but, being composed of orders whose pretensions are very different, and whose interests are opposite to each other, and to those of the nation, the states are far from effecting all the good that might be wished for the provinces, in the administration of which they partake. Your majesty may give to the other provinces, who have no sort of constitution, a better organized constitution than that of which the provincial assemblies are proud. A plan should be adopted; that might link individuals to their families, families to their village, villages and towns to their district, districts to the provinces, and provinces to the state.'

*"Remark of Lewis XVI.*

"It still appears that M. Turgot is the

enemy of the variety of orders which compose the provincial assemblies, and of the hierarchy of those assemblies, which preserves in France the faculties and honours of different individuals, and forms the hierarchy of my subjects, without which monarchy can no where exist. M. Turgot proposes an hierarchy of powers, which is chimerical, unless an hierarchy of birth forms its basis, as is the case in all monarchies, antient and modern, and in almost all republics.

"The right of citizenship cannot be lawfully granted,' says M. Turgot, 'nor a voice in the parish-assemblies, except to those who possess landed property.'

*"Remark of Lewis XVI.*

"This is the means of creating mal-content in the parish, among the class of non-proprietors; and if the former are permitted to hold assemblies, it is a germ of discord.

"I would propose to your majesty,' says M. Turgot, 'only to grant a vote to each proprietor of six hundred livres a year. He who possesses only one hundred livres a year would be the sixth part of a citizen.'

*"Remark of Lewis XVI.*

"To cut into two or four parts the rights of a man in a political assembly, in proportion to the size of his fortune, is an idea so new, and that has also something in it so eccentric and so strange, that the dignity of the state could not admit of its being proposed.

"The provincial assembly,' says M. Turgot, 'should be composed of deputies of municipal assemblies, to determine for each of their own districts the sums they have to pay.'

*"Remark of Lewis XVI.*

"This operation is transacted by means of intendants commissioned by the king, and in the provincial assemblies by the three orders. The composition of three orders has too essential a connexion with the privileges of the French, and the mission of intendants is too closely connected with the royal authority, to suffer their being metamorphosed into deputies of the people; which would be the total subversion of the established order. The administration, in general, of the provincial assemblies, with some exceptions, and that of the intendants, setting aside a few abuses, are what is best in my kingdom. It is not in that quarter that lies the principal defect of the state.

"The great municipality, Sire, the general municipality of the kingdom, would complete the municipalities of the first order: it would be the centre around which would twine, through the hands of your majesty, all the threads corresponding to the most distant and the smallest points of your kingdom. The general municipality should be composed of deputies from each provincial assembly; each deputy should be permitted to have an adjoint. Your majesty would declare, by your minister of finance, to the whole of the provinces, the sums which you would want to defray the expences of the state.

*"Remark of Lewis XVI.*

"That would be perhaps the way to obtain nothing. Our parliaments are accustomed to grant all that is required of them at the expence of the people: but they are also in the habit of refusing every thing, and of suffering themselves to be exiled, when they are to establish any tax to their own personal prejudice. To assemble the men of property in my kingdom for the purpose of levying taxes, is taking the very means of rendering them averse to the tax demanded. The Abbé Terray has fully proved that there is no certainty of raising a tax, except when it is levied by order of him who does not pay, or who pays the least part of it. The idea of forming perpetual states-general is subversive of the monarchy, which is only absolute because its authority is not divided. The moment they are assembled, there exists no longer any thing intermediate between the king and the nation, except an army; and it is grievous to confide to the military the defence of the authority of the state, against the French people assembled. The system of M. Turgot is a fine dream; it is a particular species of Utopian government, coming from a man whose views are good; but who would overthrow the actual state of things. The ideas of M. Turgot are extremely dangerous; and resistance must be made to their novelty.

"All this," says M. Turgot, "may be done this year, or the beginning of the next: but it is not until the first days of October, after the last harvests, that the municipal elective assemblies could be held."

*"Remark of Lewis XVI.*

"Here then is a new France speedily regenerated, and assembled: but, in the mean time, old France, that is, the great of the kingdom, the parliaments, the provincial assemblies, the *échevins*, the *prévôts des marchands*, the *capitouls*, would hold their sittings also, and perhaps put themselves in insurrection, desiring to know by the commission of what crimes they had merited being deposed.

"After a few years, your majesty would have a new people, and the first of people.

*"Remark of Lewis XVI.*

"It is certain there would then be established in France assemblies extremely new; for the right of property, with that of birth, and quality, the ancient forms of the monarchy, would be abolished, to substitute in their places the assemblies of a new people.

"Instead," says M. Turgot, "of the corruption, the meanness, the intrigues, and rapacity, which generally prevail, your majesty would meet at every step with virtue, disinterestedness, honour, and zeal."

*"Remark of Lewis XVI.*

"I am ignorant whether France, administered by persons chosen by the people, and by the most wealthy, would be more virtuous than it is, administered by the right of

birth, and the choice of kings. I find, in the succession of administrators named by my ancestors, and in the chief families of the robe, and even of finance, in my kingdom, Frenchmen whose names would reflect honour on any nation. The passage from the state of things abolished, to that which is now proposed by M. Turgot, merits attention; since we see plainly what is, but only see in theory what is not; and dangerous enterprises ought not to be undertaken, unless we know their tendency.—Feb. 15th, 1788.

*"Observation.*

"At the time this memorial was written, Lewis the XVIth. was strongly imbibed with the philosophical and revolutionary ideas of M. Turgot. Twelve years had now elapsed since the dismissal of that minister, when the monarch, finding that those opinions had spread among the people, turned back to the cause of the evil, which he appears to have found in the *porte-feuille* in which were deposited M. Turgot's regenerating notes and observations.

"It is on the present memorial, containing certainly the genuine principles of the revolution which took place in the following year, that the monarch fixed his particular attention. The remarks on the dispositions of this note are judicious: but M. Turgot's ideas had taken too deep root in the mind of the nation, to be now eradicated. The germs of the revolution, fostered by a genial ray from the western hemisphere, had already sprung up; and the king might make comments, if he pleased, on their mischievous properties: but it was too late to arrest, with a feeble hand, the progress of their mighty vegetation."

The translations of these letters are executed with the ease, the elegance, the idiomatic ambidexterity of a patriot of both countries. They will be appealed to by future grammarians, to decide controversies of language, and to assist in ascertaining the shades of meaning which separate synonymous parallelisms. They constitute in their present form a book remarkably well adapted to assist young persons in the acquirement of French. All the letters are given first in the original language, and next in a skilful and close version.

The commentaries are in general pervaded by an humane and equitable spirit, favourable to liberty, to morality, and to rational religion. The insincerity of Lewis is indeed arraigned; but it is there. The Girondist party is indeed applauded; but it has exalted claims to admiration. Some historical criticisms are interspersed of solid value; such are the observations on the sixty-fourth letter; yet we could have wished for the

intermixture of a little more of that personal and specific information concerning many individuals alluded to, which the translator has probably had peculiar opportunities of attaining.

The present here made to the English public is the more valuable, as we understand that the French edition is not yet published; and possibly may be thought by the low jealousy of the new monarch of France unfit for publication in his realms. An authority reduced to

put its seal on the doors of printing-offices, may be worthy of the barbaric force by which it was elevated: but it must check the foundation of schools, and the circulation of intelligence in France: it must condemn an adolescence, elsewhere consecrated to learning, there to be squandered in the debauched idleness of camps and barracks, if it would retain in its grasp the crossier of bigotry and the sceptre of tyranny.

ART. XIII. *A Statistical View of France, compiled from authentic Documents. By the Chevalier DE TINSEAU. 8vo. pp. 178.*

THIS work, with the exception of a few pages of remarks, consisting wholly of tables, is no proper object of literary criticism. It is, however, a most important political document, and on this account demands a short analysis of its contents.

The tables contained in this volume were drawn up in the 10th year of the French republic, (1801) by order of the government, and under the direction of the minister of justice, Abrial, assisted by Chanlaire and Herbin. Although the total amount of the French population is considerably greater than it has usually been reckoned, yet there seems no reason to call in question the accuracy of this enumeration, more especially as the present population of several of the large manufacturing towns, is stated considerably lower than what was known to be the actual amount before the revolution.

The first document is a complete table of all the departments, subdivided into districts and cantons, with an account of the population of the cantons and chief towns, their territorial extent, and the number of communes belonging to each canton. There are 102 departments, divided into 3317 communes, occupying an extent of 636,343 kilometres, (about 193,933 square miles) and containing a population of 33,104,343 souls, exclusive of the six departments of Piedmont, whose population is 1,946,800 souls, on a territory of 21,906 kilometres. The population of old France amounts to 27,989,924 souls, on 161,810 square miles of territory; the acquisitions from Germany, including the Austrian Netherlands, amount to 18,678 square miles, with a population of 4,387,000 inhabitants; those from Switzerland and

Italy (exclusive of Piedmont) amount to 5103 square miles, with a population of 727,419 inhabitants; hence the total population of the French empire, not including the dependent and tributary states of Holland, Switzerland, Tuscany, and the Cisalpine republic, amounts to 35,051,143 souls.

The second table contains a list of the 500 principal cities and towns in France, arranged according to the number of their inhabitants; of these, 29 contain from 1500 to less than 4000 each; 116 contain from 4000 to 5000; 106 contain from 5000 to 6000; 58 contain from 6000 to 7000; 34 contain from 7000 to 8000; 27 contain from 8000 to 9000; 15 contain from 9000 to 10,000; 45 contain from 10,000 to 15,000; 24 contain from 15,000 to 20,000; 22 contain from 20,000 to 30,000; 12 contain from 30,000 to 50,000; 8 contain from 50,000 to 100,000; and 4 contain above 100,000. The population of the whole 500 towns amounts to 5,405,119 souls; of which Paris contains 546,856; Bourdeaux 112,844; Marseilles 111,130; and Lyons 109,500.

The third table exhibits the internal revenue, collected in the 102 departments, under the heads of—1. land-tax, 2. personal taxes, and upon furniture, &c. 3. house and window tax, 4. patents, or licenses to exercise particular trades, 5. additional centimes; besides which the expences of public instruction, provincial administration, and judicial courts, are charged on each department. The total amount of all these are,—1. land-tax 210,000,000 francs; 2. personal, &c. 32,000,000, 3. houses and windows 17,600,000, 4. patents 21,845,425, 5. additional 38,720,000, 6. administration 13,205,686, 7. judiciary 14,909,385, 8.

public instruction 3,158,500; in all, 351,438,997 francs, or somewhat less than 11 francs for each individual.

Such are the resources and native

strength of that formidable power, which the unprincipled aggression of the confederated kings has exalted upon the ruins of the European continent.

ART. XIV. *History of the Revolutions of Russia, to the Accession of Catherine the First: including a concise Review of the Manners and Customs of the 16th and 17th Centuries.* By HENRY CARD, A. B. Pemb. Coll. Oxon. 8vo. pp. 710.

ONE of the most valuable sources of Russian historiography, is *Schloetzer's Probe Russischer Annalen*. Mr. Tooke, in his excellent History of Russia, has consulted, with becoming attention, the admirable labours of this profound, this omniscient antiquary; who, in all the branches of arctic palcosophy, has displayed a research, a sagacity, and an adapted erudition, which will long be toiled after, with vain emulation, by the panting antiquaries of these puny times. From a writer on the revolutions of Russia, one is disposed to expect, and even to claim a careful perusal of at least all the leading authorities. It is not enough to tell us, (at page 6) that "the several writers who relate, in the sixteenth century, the history of Russia in the Latin language, are far superior in their compositions to any other foreigners of a subsequent date;" when the first antiquary, which the world ever produced, has subsequently consecrated so much labour to the express investigation of Russian affairs. Yet Mr. Card seems ignorant of the very existence of Schloetzer, and neither refers to his memoirs in the commentaries of the Petropolitan academy, to his specimen of Russian annals, nor to the sketches scattered in his northern history.

Assemani, the Syrian, fancied he had found in Theophanes, that is in the year 774, the first traces of the Russian name; but a severer criticism construes the epithet *ερυθροι*, to mean *ruddled*, or *painted red*, and not *Russian*. It is therefore in the Bertinian annals, and to the year 839, that the first trace must be referred. The Russians speak a Slavonian dialect, and must consequently be allied in language, as Forster has shewn in his letter to Michaelis, with the Medes of antiquity; from some of whose tribes they no doubt descend. In 862, they submitted to the sway of Rurik, a Norman, who made Novgorod his chief residence, or seat of empire. In the Vandal tribes, who peopled Carinthia, Bohemia, Bavaria, and Moravia, the peasantry have still

Slavonian names, but the nobility Gothic names; so that an early internal hereditary ascendancy was every where acquired by the Goths, over the contiguous Slavonians; either because they were the more civilized of the two tribes, or from a physical admiration of their fairer complexion and appearance. Such causes would sufficiently account for the elevation of Rurik; but our author assures us, (page 8) that "he was selected by the republicans of Novgorod, to purge their city from the impurities of discord." How has Mr. Card found out, that there ever was a republic at Novgorod? Does he rely, in this age of historical criticism, on the authorities which taught Milton that Rurik descended from Augustus, and flourished in 573? And that the imperial cup was the skull of Stoslaus, inscribed *seeking other mens' he lost his own*. It may be allowed to Soumarokoff, in a tragedy, to make Vadim a hero of liberty; but the historian should not describe savages like citizens of Geneva or Paris.

The dynasty, which sprang from Rurik, continued to reign until 1598. In 882, they acquired Kiow, and transferred thither the seat of power. In 955, Olga, the daughter-in-law of Rurik, went to Constantinople, and was there baptised. Her husband and son continued faithful to Perun, the national idol; but in 988, Volodimer, or Vladimir, a grandson, submitted to baptism. With the religion of the Constantinopolitan Greeks, their monks, their arts, their sciences, penetrated into Russia; and already, in 1056, was born Nestor, the first Russian annalist, who wrote at the end of the eleventh century, and died in the Pechzerian convent at Kiow. He supplies what of tradition is known concerning the earliest history; and from his time onward, other monkish chronicles furnish the rest.

Sylvester, the abbot of Perejaslavl, who died in 1123, was the continuator of Nestor's chronicle; to him succeeded Simeon, bishop of Susdal, who wrote in 1206, and many other ecclesiastics.—

Some corroborations or corrections of their intelligence, may be gleaned from the chronicles (*stepennye knigi*), pedigrees (*Rodoslovnje knigi*), and red books (*Rozradnye knigi*); but the earliest document preserved in the archives of the empire, dates from czar Andreas, who died in 1158.

It is one part of the usual task of an historian, to record and to appreciate the fountains of his intelligence; but from the references attached to the chapters of this work, one would almost suppose the greater part of these notorious particulars to have escaped our author's knowledge. The Latin historians of the sixteenth century, Leclerc and Leveque, Frenchmen, and Bayer, are his favourite vouchers, and from them he often quotes at second hand. Instead of complimenting the Russian nation with an original enquiry into its annals, which might contribute to inspire at Petersburg and Moscow a solicitude about English opinion, we have a declamatory substitution of vague allusions, to novel or definite intelligence. Every thing is narrated, as by Gibbon, in abstractions. It is always the intrepidity, or the piety, or the cruelty, or the patience of the sovereign, and never he himself, which produces a given effect. As in a French epic poem, allegorical personages seem the only agents; thus all precision of assertion, all personality of information, is inconveniently eluded. Yet the style itself is highly polished, splendid, and impressive; like the tragedy of Zingis, it abounds indeed with hard names and noisy lines. We have to hear

"How 'gainst the Nirons the bold Naimans  
"stood,

"And red Taxartes foam'd with Omrah's  
blood."

But if any dexterity of diction could prepare the public for receiving, with interest, an account of heroes and tribes, as yet so unknown to celebrity here, it is precisely a form of narrative, which has associated their mention with periods so spangled with sounding epithets, and rounded with polysyllabic terminations.

We shall quote the account of the introduction of christianity :

"The first ray of evangelical light seemed to beam on the Russians under the reign of Oskold, the prince of Kief; in one of those sudden excursions of piratical adventure which perhaps had before alarmed the timorous Greeks, the enterprising Oskold marked out their magnificent city of Constantinople, as

the grand object of his predatory ambition; this daring attempt was made with two hundred boats, or *Monoxyla* as they are called by the Emperor Constantine Porphyrogenitus. If the whole force of their country had been exerted, their navy perhaps might have amounted to two thousand vessels. Without opposition they passed the Thracian Bosphorus. Emboldened rather than satiated by this extraordinary success, they attempted and succeeded in occupying the port of Constantinople, under the reign of the Emperor Michael III. who had some time left his capital with the vain hope of chastising the insolence of the Saracens. On the first news of these unwelcome and dangerous visitors, he returned with his army to revive the fainting courage of his capital. The reader, who keeps in his remembrance a geographical view of Constantinople, and the situation of the Russians, can well imagine the numerous difficulties which the Emperor had to encounter in effecting a landing at the palace stairs, from whence his superstition, that indisputable offspring of fear, directed his agitated steps to a church of the Virgin Mary; where the devout Emperor, with his no less devout patriarch, passed the whole night in prayers; instead of meditating the relief of his people by a well determined spirit of zeal and patriotism.

"By the injunctions of the patriarch, the garment of the Virgin Mary, a most precious relic, was drawn from the sanctuary and dipped into the sea; and their weak hearts fondly persuaded themselves, that by this act of futile devotion, the thunder-bolt of divine vengeance would have been hurled against these bloody and fierce barbarians. A seasonable tempest, however, released them from their present fears, by compelling the Russians to a precipitate retreat, which was most piously attributed, by their blind credulity, to the propitious influence of the mother of God. Oskold, the chief of this expedition, after enjoying the glory of humbling the Greek pride, demanded a peace, which was readily granted by their abject fears, and perhaps from a secret persuasion, that in a second critical juncture, the succours of their divine protectress might come too tardy. After the terms of the treaty had been adjusted, Oskold expressed a wish to receive the sacred waters of baptism. And, under his auspices, a Greek bishop, with the name of Metropolitan, might for the first time have administered the sacrament in the church of Kief: but the salutary vegetation of the gospel was blighted by the ungenial touch of these barbarians; since, after the death of Oskold, this short glimpse of holy light was soon involved in a cloud of ignorance, so thick and heavy as to obscure almost all traces of their christian conversion.

"Nor did this loathsome darkness disappear, until the Russian throne was mounted by the princess Olga. A woman (perhaps of the meanest extraction) who could punish

the death of her husband Igar, and obtaining a regal sway over a fiery and turbulent people, who then could scarcely submit with patience to the government of their legal princes must have been pre-eminently gifted with those masculine qualifications, which imprint the duty of obedience on minds the least tinctured with the virtues of civilization. Though gross idolatry overspread her country, yet the precepts and example of the missionaries transplanted by Oskold had made an impression on her heart too deep to be easily effaced; accordingly, moved by the wish of embracing christianity in the most august manner, or by the less spiritual desire of extending the circulation of her trade, she sailed from Kief to Constantinople in the time of public and private tranquillity.

"The royal historian, the Emperor Constantine Porphyrogenitus, welcomed her arrival with all the honours appropriate to the majesty of her rank; and with all the forms and ceremonies which could flatter her female vanity, and display the transient greatness of his luxury and splendour. From the numerous and costly presents which at once perhaps excited her astonishment and gratified her avarice, we may select, as no mean specimens of imperial generosity, and as most adapted to a lady's wants, some vases of rare value, and a quantity of those fine stuffs which were then only fabricated in the east. The emperor himself conducted her to the baptismal fount, where she received the venerated name of the empress Helena. The Russian chronicles would teach us to believe, that her beauty so captivated Constantine, that he offered to share his throne with her; but if the emperor himself had not informed us that his wife was yet alive, we should want no better evidence to refute this tale, and to show us that he would have indignantly rejected the union, than the perusal of his instructions to his son Romanus, in which he exposes the ill policy of listening to the overtures of foreign alliances.

"On her return to Kief and Novgorod, she pertinaciously adhered to her new religion; but this great princess, great does she deserve to be called, (for in this barbarous age, she constructed towns and villages, formed bridges and roads for the benefit of trade, and established institutions of general utility,) sensibly experienced the weakness of her power, and the obstinacy of human nature in her unremitting endeavours to wean her nation and son from their attachment to the gods of their fathers."

"Proud and sanguinary, and strangers to all those pursuits which give birth to acts of humanity and justice; her people scorned and were ill calculated to tread in the smooth paths of humanity and peace. Whilst to all the frequent pious exhortations of his mother, the harsh inflexibility of Sviatoslaf insultingly demanded, whether she wished him to become an object of contempt and derision to his companions. From the temper of this

interrogatory, it requires no prodigious depth of sagacity to have foreseen, that the christian religion would soon shrink into insignificance and obscurity on the death of Olga. And indeed so rapid was its decline, that the churches erected by the fervent zeal of this princess, could scarcely preserve it from total extinction.

"We have now contemplated the rise and progress of christianity, and deduced the visible causes of its decay. From this period, a more pleasing exercise commences; to observe the gradual extirpation of paganism, and to mark the final establishment of the christian religion.

"The military renown, the increasing wealth, the unrelaxing firmness, the extensive authority of Vladimir, now began to command the fears and invite the attention of the neighbouring potentates. By gifts they courted his esteem; by embassies they solicited his conversion to their respective religions. Nearly at the same time, it is said, were presented to him, deputies from the Pope, or rather of some catholic prince, from the people of great Bulgaria, and from the Jews established among the Kozares. But all their prospects of success were darkened by the mission and lively eloquence of a Greek Metropolitan. This loquacious prelate, whom the chronicles dignify with the appellation of a philosopher, though he failed in making an absolute proselyte of his illustrious auditor; was, however, dismissed with his friendship and gifts: an enviable happiness which the rest, perhaps, had sighed for in vain. Indeed, so strong was the impression made on the heart and understanding of Vladimir, by the discourse of this theological advocate, that he dispatched six or ten Russians, of pre-eminent wisdom among their countrymen, to inspect minutely the religious principles and rites of their different countries.

"They first directed their course to the Bulgarians, (eastward of Russia) and zealous champions of the warlike prophet of Mecca; but they soon changed their abode, little moved by their extravagant veneration for the chimerical doctrines of their apocryphal Koran. They afterwards visited the Latin churches of Germany, whose want of external ornament they beheld with the unfavourable emotions of pity and contempt. But in their arrival at Constantinople, they gazed, with inexpressible admiration and delight, on the magnificent dome of St. Sophia; and their attention was equally arrested by the pompous and alluring embellishments which adorned their altars; by the impressive pictures of their saints and martyrs; by the rich vestments of their priests; by their idolatrous worship of images and relics; and by the pleasing order of their ostentatious ceremonies. A religion, therefore, which embraced such a succession of splendid rites, was soon considered, by their uncultivated intellects, to contain the very essence of christianity.

“ With minds heated and enraptured by these gaudy, though, perhaps, not unmeaning spectacles, they hastened their return to Vladimir. To his anxious inquiries, on the events of their mission, they dispatched, with a disdainful impatience, their account of the Latin ceremonial; whilst they expatiated with a visible satisfaction, and with all the glowing colours of enthusiasm, on the various beauties of the imperial city of Constantinople. We thought ourselves transported into Heaven, exclaimed they to their attentive monarch; nor were they slow to believe, that a choir of angels came down each day from the skies, to join in the sacred song of the Greeks. Thus completely did the lustrè of the Greeks eclipse all hopes of their conversion to the Latin church. When the curiosity of the prince was sufficiently satisfied by their description, they implored his permission to be initiated into the pleasures of religious adoration at Constantinople.

“ No sooner had the boyars of his counsel perceived the propitious effects of this recital on the mind of Vladimir, than they instantly cried out, such was their abject credulity, or such was their fawning obsequiousness, that the religion, which could be honoured by the praises of the sage deputies, and embraced by the pious Olga, must be worthy of implicit belief.

“ But though Vladimir listened to the voice of reason, or rather to the dictates of his own inclinations, yet his conversion was retarded from the want of Greek priests. To demand them of the emperor was a species of homage, at the very idea of which his lofty soul revolted; the barbarian therefore designed to sow, with his sword, that baptism and instruction which, to have possessed in a proper manner, he would have judged no less wounding to his dignity than disgraceful to his valour. This wild and eccentric plan was pursued with a persevering industry, and executed with a systematic spirit.

“ Promptitude and obedience must be interwoven in close contexture, to accomplish all expeditions of peril. These incentives to success were not neglected by Vladimir. An immense army, composed from the flower of his empire, soon passed the Taurican Chersonese, and unfurled their banners under the lofty battlements of the ancient Theodosia, the modern Kaffa. Before this place he is said to have addressed the Almighty Power, in a speech worthy of himself, and his country, and his times: ‘Oh God! enable me to overcome this city, that from thence I may transport priests and christians into my dominions, whose piety and learning may instruct us in the true exercise of religious worship.’

“ He then attacked the city, unaided by any of the implements of assault, which so essentially contribute to expedite the labours of a siege. But his slow progress, and the number of his gallant men, which he devoted to death from his proud and wanton capriciousness,

might have excited, in a less ignorant mind, some apprehensions, that his present conduct was considered as a direct violation of those moral and christian duties which he so anxiously wished to discharge.

“ After pressing the siege for six months, with an ineffectual vigour, the pagan began to suspect, that he had adopted an expedient by no means favourable to his present conversion; and, with the shame of relinquishing his enterprize, he now entertained the most serious fears, that he must also renounce the pious object which provoked him to it, if a perfidious citizen, or, as some more rationally declare, a priest had not preferred the virtues of spiritual to temporal obedience; a letter fixed to an arrow, shot from the top of the ramparts, delayed his march and rewarded his valour. Behind their camp, they learned from this aerial information, was a fountain, which alone enabled the besieged to taste, from its subterranean pipes, the refreshing comforts of pure water. The rejoiced Vladimir was not long in discovering and destroying this necessary support of a long resistance. The difficulties of the enterprize then vanished; the complaints of thirst were heard, felt, and soon remedied, by a general surrender. In possession of Theodosia, he saw himself master of the whole Chersonese.

“ By this victory his power was enlarged and his fancy gratified: but this inestimable gift of baptism formed not the sole object of his ambition: he aspired to mix his blood with the blood of the Cæsars, by a marriage with the princess Anne, sister to the reigning emperors Basil and Constantine. His pretensions were enforced by the promise of conversion, and by the insolent threat, that Constantinople might soon expect the same fate as Theodosia, should his reasonable demands be dismissed with contempt. After some affectation of delay, they consented to the first proposal; since all maxims of state were annihilated; all prepossessions lost; all regard to purity of descent set aside, to confirm their safety. At the same time, therefore, and in the city of Cherson, the rites of baptism and marriage were solemnized by the christian Pontiff. The city he restored to his brothers-in-law; whilst abbots, priests, images, relics, holy books, and sacred vessels, were transported into Russia as rewards of this conquest and alliance.

“ On his return to Kief, every indignity which could be devised by the imagination of Vladimir, was offered to those idols which he had so long adored; under the sagacious view of diminishing their estimation, and consequently of obtaining a more ready acquiescence to his devout example. Peroun, the god of thunder, and the most august of their divinities, at his despotic command, was tied to the tail of a horse, and dragged through the streets of Kief; whilst twelve vigorous soldiers, during this woeful procession, battered, with clubs, the golden head and stiff

ver ears of the mishapen image, until it was furiously thrown into the waters of the Bosphorus.

“Immediately after this public act of expiatory vengeance, an edict of Vladimir, proclaimed to his subjects, that all those who refused the rites of baptism would be considered and treated as enemies of Jesus Christ and of their prince. On the moment this order was published, many thousands of Russians, instantly flocked to the rivers, with obedient joy, to receive the sacrament of baptism. No persecutions nor admonitions were necessary to strengthen this decree; since they all tacitly submitted to the truth and goodness of a doctrine, which had been adopted by him and his boyars.

“Such was the final establishment of christianity, which soon levelled with the ground the gross and incongruous edifice of pagan superstition.”

The narrative is continued to the death of Peter, called by Voltaire, Peter the Great. Voltaire willingly praised the sovereigns who turned adventurers, well aware he should thereby pave the way for adventurers to turn sovereigns; but if he had chosen to satirize Peter as a madman, posterity would quite as readily have ratified the verdict. Has a sovereign nothing better to do than to put himself apprentice to a ship-carpenter in Holland? Is there no simpler, easier, surer way of teaching the art of ship-building to his subjects? Was it wise to shift his metropolis to Petersburg, and thus to condense populousness where agriculture, commerce, and every sort of productive industry are necessarily paralytic, during more than half the year, from climate? He ordered the introduction of Danish legislation, which, before Bernstorff, was the most despotic in Europe; but he wanted to get under a nobility, which ventured to resist his caprices, instead of distributing civilization to the people, through the medium of his nobles. By attempting to skip this step in the natural process, he deferred, a full half century, the possible march of Russian improvement. His military excellence was inconsiderable; his reforms in the ecclesiastical order approach expediency; yet the active patronage of what literature existed in the Russian church, would probably have conducted more to the progress of intellect, than a jealousy of the priesthood, and an extinction of the patriarchate — The people, as yet, were alike unprepared to spare their beards, or their priests. As to the speeches put into Peter’s mouth by Levesque, and transcribed or con-

densed (there is one at page 558) by our author, they are not in costume, they are plainly manufactured, beside the Argand lamps of the Parisian book-makers; and have no more claim to authenticity, than Herodotus’s debate of the Persian conspirators, on the best form of government. Could Peter have prated about arts, and Greece, and glory, surely he would not have waged an obstinate war of twenty-one years, for deserts, against Sweden; surely he would not have been the executioner of his wife and of his son; nor have attempted that overthrow of hereditary succession to the throne, which is the only apology for the monarchic institution itself.

Let us suppose Peter, in every thing, to have lived the reverse of his real life, it will be obvious, that Russia would have been more indebted to him; the extraordinary is not the excellent. If instead of a personal simplicity, bordering on nastiness, he had been luxurious and pompous in his apparel, the imitative nobility would have sent to Lyons for silks, and velvets, and embroidery; and in order to meet the increased expenditure, would have endeavoured to increase on their estates the growth of hemp, the reserve of tallow and hides, and the smelting of iron. To personal would have succeeded apartmental decoration; and the business of the carpenter, the plaisterer, the upholsterer, would have been taught to the apprenticed vassals of all the nobles, and the arts of life have been domesticated in every village. Had he increased the pomp of worship, and the numbers of the clergy, and carefully patronized the literate among them, an order of school-masters would have been distributed over his empire, who could alone persuade his stupid subjects to the toil of alphabetic learning, by persuading them that prayers should be read aloud. Had he purchased, by the cession of Lapland and Finland, and of the very site of Petersburg itself, a twenty-one years peace of the Swedes, the population of his empire would meanwhile have doubled, the pioneers of desolation would have been making roads, and the architects of ruin have built cities. The scantling, not felled for pikes, would have become saleable timber; for moveable camps there would have been stationary villages; for murders, marriages. Had his metropolis been stationed near the mouth of the Don, a fertile soil, a climate which ripens two crops within the year,

an intercourse with the long polished and luxurious Mediterranean nations, would have attracted a colony tutored in all the arts of industry, trade, and civilization, and would have matured in his single reign a higher growth of prosperity, than has taken place in a century on the banks of the Neva. The rivers of the Euxine branch far inland, and would have diffused the productions of interchange. And what to low ambition and the pride of kings is perhaps of more consequence, the strength of

empire being accumulated in the south, would far more speedily have blunted the horns of the crescent, and have restored Turkey to christian sway.

Mr. Card has certainly furnished to the public a convenient and florid epitome of Russian history, which displays perhaps more talent than research, more brilliancy than judgment, more eloquence than industry; but which still merits praise for extensive information, for instructive remark, and for splendid composition.

**ART. XV.** *The History of the Invasion of Switzerland by the French, and the Destruction of the Democratical Republics of Schwitz, Uri, and Unterwalden.* By HENRY ZSCHOKKE, National Prefect of the Canton of Basil. Translated from the French of J. B. Briatte, Secretary of Legation to the Helvetic Republic at Paris; with a Preface and Supplement by the Translator. 8vo. pp. 365.

OF this very interesting narrative we have already given an account in our former volume, p. 339; it only remains therefore for us to add, that the English version now before us is characterized by its elegance and fidelity, and is enriched by a short supplementary notice of the further proceedings in Switzerland, till the election of the heroic Aloys Reding to the office of landamman of Schwitz, in March 1803.

"The publication of this work in English," observes the translator, "at the present period was thought peculiarly calculated to promote that spirit of resistance to unprincipled ambition, and the schemes of universal domination, which is alone to be relied upon in the arduous contest in which the nation is now engaged. The history of

the memorable struggle here recorded will show what a people very inconsiderable in point of wealth and number was able to do in checking the progress of a host of invaders, by the mere force of native courage, and enthusiastic love of liberty and their country. It will show, that, stimulated by these motives, a band of peasants could be brought to charge with the bayonet, and entirely to defeat, battalions rendered formidable by their victories to the most warlike troops in Europe. It will also afford much valuable instruction for avoiding the faults which frustrated the defensive plans of the most powerful part of the confederacy, and placed the final stake in the hands of a few half-armed herdsmen. Moreover, it cannot fail to impress every generous mind with an indignant sense of the insolence of a lawless conqueror, and the degradation incurred by a vanquished and subjugated people."

**ART. XVI.** *The History of the Maroons; from their Origin to the Establishment of their Chief Tribe at Sierra Leone: including the Expedition to Cuba for the Purpose of procuring Spanish Chasseurs.* By R. C. DALLAS, Esq. 8vo. 2 vols.

MR. BRYANT EDWARDS, the celebrated historian of the West Indies, published in 1796 a cursory narrative of the Maroon war, which this author has undertaken to treat at large, in an epistolary form, but with much of the pomp and circumstance of regular history. The work is dedicated to a privy-counsellor of Jamaica, William Dawes Quarrell, to whom the author represents himself as principally indebted (p. v) for the original and peculiar information contained in these letters; an information the more to be relied on, as he was the commissioner sent to Cuba for the Spanish chasseurs.

Mr. Dallas differs somewhat from Mr.

Edwards, respecting the origin of the hostilities, which he thus comments:

"The whole cause of the Maroon revolt has been attributed to their resentment for the flogging of two of their people. It appeared afterwards, that these were persons of no consideration among them, and that but for the occasion afforded them of a pretence for complaining, they would themselves have hanged them without ceremony. The two men had been found guilty of theft, and punished before the slaves in the common workhouse, by a runaway negro who had formerly been taken by them; an act certainly impolitic. As the culprits went through the town and plantations they were laughed at, hissed, and hooted by the slaves: the more discontented part of the Maroons

seized upon the transaction as a reasonable ground for manifesting the temper they were in, and proceeded accordingly to dismiss captain Craskell. The intelligence given to the lieutenant-governor respecting the intended junction of the Maroons of Accompong Town, and of the preparatory measures taken by those of Trelawney Town, was more the result of alarm than of inquiry: no such measures were taken, nor did the Accompongs ever testify any intention of joining the others, as will be seen in the sequel. The Trelawney Maroons had long manifested their discontent against the Accompongs, for not yielding to them the original treaty made with Cudjoe, which they claimed the right of keeping. About this time it was again sent for, to be shown if necessary, and was given by the Accompongs, but never returned to them.

"On the day that the magistrates of St. James's wrote to the lieutenant-governor, they also sent a message to the Maroons, proposing that four of their justices should meet four chosen Maroons on the next day to settle all differences. To this an insolent answer was returned in the following words: 'The Maroons wishes nothing else from the country but battle; and they desires not to see Mr. Craskell up here at all. So they are waiting every moment for the above on Monday.' This was signed colonel Montague, and all the rest; and in a postscript was added, 'Mr. David Schaw will see you on Sunday morning for an answer. They will wait till Monday nine o'clock; and if they don't come up they will come down themselves.' This curious epistle, it was afterwards well known, was dictated by a few drunken Maroons, to a poor ignorant white man, without the concurrence of old Montague, who was then sick and absent; nor was it known to one-tenth part of the people: and I must not omit to say, that the principal men among the Maroons have ever denied that they voluntarily entered into a rebellion against the authority of the government, declaring they were forced into hostilities on a principle of self-preservation, being persuaded, from the subsequent conduct of the white people, that their destruction was determined. Be this as it may, a turbulent spirit had been evinced among them, to subdue which firmness was necessary. While therefore some headstrong Maroons were using a soldier of captain Craskell's ill, and compelling him to write to his commander, that it was too late to do any thing good, and that they wanted nothing, having got plenty of powder and ball, the Trelawney militia moved up to Green-Vale, a penn at the foot of the mountains leading to the Maroon Town, about three miles distant, and of most difficult access. Mr. Thorp, the custos of the parish, and several other gentlemen, accompanied the corps. As they approached the hill, they observed a single man winding along the acclivities

with astonishing agility, and brandishing a lance to show that he had no other arms. This was a Maroon captain of the name of Smith, a young fellow of exquisite symmetry, whose limbs united all that was requisite both for strength and activity: the superiority of his gait, as he descended the side of the mountain, and the wild grace with which he flourished the lance over his head, excited the highest admiration. He approached the custos, and delivered a letter to him, in which he was requested to proceed to the town, accompanied by Mr. Gallimore, Mr. Knowles, Mr. Galloway, and Mr. Stewart. The invitation was accepted, and these five gentlemen went forward to Trelawney Town, where they found general Reid, Mr. Mowat, and major James, their late superintendent.

"The Maroons had prepared for this meeting, and received their visitors under arms, not however in the manner of a regular army, but with an apparent ferocity, wild manœuvres, and evolutions little suited to a deliberate and free discussion; nor indeed could the scene be viewed without a degree of alarm. Some of the Maroons had been qualifying themselves, as they often did on great occasions, with a sufficiency of rum, with which they had been abundantly supplied by intimidated persons in the neighbourhood willing to secure their favour.

"After much clamour, it was settled that one of their captains, named John Jarrett, by no means the least violent, should moderate his voice, and deliver himself in such a manner as to enable one of the gentlemen to write down what the Maroons wished to say. This being reduced into some form, the grievances they complained of appeared to be as follows:

"1. An infringement of their treaty by the magistrates of Montego Bay, in causing the punishment of whipping to be inflicted on some of their people by the hand of a slave.

"2. That the land originally granted them for their subsistence was worn out, and being not sufficient for their support, they required an additional quantity, saying that the pens of several settlers in the neighbourhood would suit them.

"3. That captain Craskell, their superintendent, was, on account of his timidity, unqualified for his office; and as they had experienced the disposition and abilities of major James, they were desirous of his re-appointment; and averse to receiving any other.

"Other matters were also alleged by them as grievances, but which they were induced to relinquish, on condition that the gentlemen present would consider themselves as pledged to obtain redress for what was specified in this statement from the house of assembly, who were to meet early in the ensuing month: at the same time they showed a firmness of determination to pursue their object till these claims were satisfied.

The gentlemen promised that their causes of complaint should be inquired into by the legislature, in order to be redressed.

"The Maroon speaker, after expatiating on the insufficiency of their lands, the inability of Craskell, and the qualities of James, without whose re-appointment they could not be satisfied, exclaimed: 'You are our tattas (that is, fathers), we your children; our situation, and the superiority we have in this country, we derive from our connexion with you; but when we do the duty required of us for these advantages, do not subject us to insult and humiliation from the very people to whom we are set in opposition.' He concluded by relating the triumph and language of the negro who flogged the men, and who was a slave whom they had previously taken up and lodged in the workhouse for punishment. The slaves of course, says one of the planters, made use of an opportunity to revenge themselves on the Maroons.

"The Maroons being soothed by the promises they had received, and the mediators being relieved from the apprehensions caused by the mode of their reception, the latter assented to the reasonableness of the complaint of the former, engaging to use all their influence to promote their wishes. Pleased at the result of the visit, or with a view of farther insuring the satisfaction that appeared, it entered the mind of one of the mediators to propose a collection of money among themselves, for the people with whom they had come to mediate, and each gave something, except the gallant colonel Gallimore. He saw in success, obtained by tumult and violence, and in rewards bestowed on insolence, the seeds of future turbulence; therefore, instead of producing his purse, he took from his pocket some bullets, and showing them, said: 'This is the reward you deserve, and no other coin shall you get from me.' In the evening the mediators left Trelawney Town, hoping they had for a time, at least, tranquillized the Maroons.

"However satisfied the visitors were with the issue of their visit, the public mind was not so easily pacified in the capital, where a diversity of opinion arose respecting the conduct to be pursued towards the Maroons. General Palmer, of the parish of St. James's, wrote a letter to the lieutenant-governor, recommending, in the name of a meeting assembled on the occasion, a compliance with their demands; and, in a second letter, urged the reinstatement of major James and his son. Mr. Tharp, one of the great proprietors, and then custos of the parish of Trelawney, who, since the meeting he attended in Trelawney Town as mediator, had joined the fleet about to sail for Europe, also recommended temporizing and acquiescing in the demands made, as they were reasonable. In a letter written the day before he left the island, after imputing the rebellion of the Maroons to the improper

conduct of the magistrates of St. James's, and a few trifling causes of discontent, he declared he was confident that hostilities would have commenced some days before, without specifying what prevented their taking place; but stating, that he believed Craskell, from what he understood, to be unfit for the office of superintendant; that major James was the idol of the Maroons, and that nothing less than his re-appointment would satisfy them.

"Soon after the departure of the custos for England, where he had estates that required his care, the Maroon affairs assumed a better aspect, and his judgment respecting the influence of these dreaded mountaineers over the slaves, which, in his opinion, would bring ruin on all, appeared to have been hastily formed; for neither the plantation-negroes, nor the other bodies of Maroons, discovered the slightest design of supporting them. On the contrary, those who were the most suspected, the Accompongs, publicly testified their disapprobation of the conduct of the people of Trelawney Town, declaring that they had a superintendant (captain Forbes) whom they loved, and whose advice they were resolved to follow. They immediately made a formal renewal of their compact with the whites, rendering the ceremony more solemn by the baptism of all the younger Maroons. Some of the plantation-negroes in the neighbourhood about this time preferring complaints against their overseers, their conduct was at first construed as taking advantage of the situation of things: but no alarm from the general conduct of the slaves could be justified, for never was a spirit of order and obedience more observable among the negroes than at this period. Even Edwards, who charges the Maroons with an early seduction of the slaves, says; 'Happily the class of people on whom they relied for support, remained peaceably disposed; nor did an instance occur to raise a doubt of their continuing to do so.' Neither did the planters attribute the discontents expressed on the plantations in the vicinity, to the influence of the Maroons; on the contrary, one of them says, 'What check have we so effectual as the Maroons?' and mentions this as a motive for settling with them without hostility; at the same time recommending the recollection that, in the rebellion of 1766, the Maroons brought in the head or person of every slave in rebellion; in the space of one month.

"Finding that, far from being supported, they were upbraided by the Accompongs, the Trelawney Town Maroons had leisure to reflect on the insolence of their conduct, and after some days evinced a less intractable disposition. On the 26th of July, information was received from a white man who had been at their town, that they were peaceable, and said they would be satisfied, as Craskell was removed, if they were left alone. It appeared clearly that the Maroons

were divided among themselves; that the milder and more numerous were kept in awe by the smaller and more violent, who were the younger. It was evident, too, that they were now in a state of repentance; for, in an account sent on the 28th by major James, who had been requested to remain among them till the business was arranged by the executive power, they were stated to be in so humiliated a condition, as to be ready to accede to whatever might be requested of them. One of them was in irons, by his order, for an impertinent expression, and the body of Maroons offered to sacrifice him rather than aggravate their offence: it was also determined among them, that six of their principal officers should go the next day to make a submission, and obtain a passport from general Palmer to Spanish Town, to lay their complaints before the governor, and submit themselves to him.

"Thus affairs seemed to be in a train of tranquillity; and, indeed, so confident was lord Balcarras of it that, on the militia being permitted by their commander to go home, and on the representation received of the state of things, he dispatched orders for the return of the troop of light dragoons that had been sent from Spanish Town, and suffered the 83d regiment of foot, which he had before expressly detained, to sail for St. Domingo, under convoy of the Success frigate. He also sent orders for captain Craskell to repair to Spanish Town, and directed that the chief captains of the Maroons should proceed to town by the 31st of July to make their submission."

This promising tranquillity was interrupted by the mischievous suggestions of the alarmists, who, by sowing mistrust and exaggerating danger, provoked men in authority to take those critical measures of precaution which, by terminating the protection of law and the comforts of liberty, justify a reclamation of the rights of nature. There is a species of moral cowardice, perfectly compatible with animal courage and personal bravery, which is in all emergencies the most dangerous and the most cruel of counsellors. It consists in a morbid irritability of the imagination, which requires on all occasions, not the proportionate, but the strongest possible antagonist stimulus. It is a species and degree of insanity which leads men to expend on precaution more than the worth of preservation, to break a butterfly upon a wheel, to oppose a village-riot by inflicting martial law over a county, to answer a pamphlet by a proscription, and punish a heresy by a massacre. Those writers and speakers who are afflicted with this disease, the

professors of the terrible, as they might be called, are sure to elevate and surprise, to agitate and impassion their hearers: hence they acquire a reputation for excellence and influence, which arises only from the imperfect and ignorant taste of their disciples. Merely to produce a great effect is not meritorious: he who throws a heavy stone into a puddle may do that; but if thereby he besplashes and bemires the ladies who are walking near, it is not his skill, but his awkwardness, that ought to be noticed. These agitators are in politics, what methodist preachers are in religion: the fears they infuse occasion much useless misery, and though they prevent little, they never prevent great evils in social conduct. France, Ireland, and Jamaica have of late years suffered horribly in consequence of listening to the energumens. To overstate danger, and to propose extreme remedies for any danger, is the greatest possible inversion of political wisdom; the use of employing talent and virtue in the government of states is, that they can accomplish their objects by milder means and gentler efforts than stupidity and brutality can. But alarmists restore to civilized society the panic terrors of barbarism, and fling away the properties of provinces and the lives of millions, for the attainment of purposes which judicious men would have obtained by a slight tax and a little recruiting, by an address to the voluntary faculties, and without the infamy of oppression.

"In the end of July all was peace, and the humbled Maroons were directed to send their captains by the 31st of the same month to Spanish Town, to make their submission. This it was impossible to comply with, owing to a delay occasioned by the messenger who brought the dispatches; but the Maroon captains came down as speedily as possible, and proceeded on their way to the capital. In the meantime, the public mind was considerably agitated by the affairs of St. Domingo, by an apprehension of the contagion of revolutionary principles spreading to Jamaica, by a currency of vague reports respecting French agency in the island, and by a reluctance to sending troops off the country at so alarming a juncture. It should seem that the commander in chief was also actuated by these motives; and they were certainly sufficiently substantial to excite vigilance and decision. A council of war was accordingly held on the 3d of August; the members of which, considering the flying reports that Frenchmen and people of colour were conspiring with the Maroons, the

danger of suffering the departure of the troops ready to sail for St. Domingo, and the necessity of justifying Lord Balcarres in detaining them, concurred in opinion that it was requisite to establish martial law; which was accordingly proclaimed.

"That the detention of the troops was a wise measure, is not to be contravened; but it cannot be denied that the south side of the island was alarmed by reports from the north side, of which the north side knew nothing; and the north side by reports from the south side, of which the south side knew nothing; and, whatever might have been the intentions of the revolutionary French, and no one will doubt that they would have revolutionized Jamaica had they been able, it does not appear that any conduct of the Maroons, subsequent to their proposed submission, justified a suspicion of their insincerity. Indeed, all the evidence obtained respecting their offences, not only related to past matter, or to matter subsequent to hostilities, but was not deposed till some weeks after the declaration of martial law; and the like may be observed of all the evidence relative to the designs of the French. They were depositions taken subsequently of conversations and vague notions at different times prior to the departure of the six captains from Trelawney Town, or of expressions used, and acts committed, after their being thrown into irons.—The Maroons never thought about the forces on the island, knew nothing of the intended embarkation for St. Domingo, had not been tampered with by the French, nor had they themselves, at this time, tampered with the slaves. A neglected, half wild body of people; they were ready to be tumultuous or submissive according to the ascendancy of their passions. When cool, they would grow enraged at the sight of Craskell; and in the excess of rage and tumult, bands of them would become cool at the blows of James. These were not people to be plotting deep conspiracies. They had ignorantly braved the government, and it was necessary to make them feel their dependence: they had felt it, and it became politic to make them easy and happy in that dependence. The chief motives by which the council of war were influenced, must undoubtedly have arisen from the apprehension of a general insurrection among the slaves on revolutionary principles; an apprehension which the very nature of the French revolution, more than the suspicious deposition of a French prisoner, justified their entertaining. On these grounds they armed the lieutenant-governor with the powers of martial law; and on the 4th of August his honour left Spanish Town in order to take the command of the troops in person, in a

quarter where the revolt was expected to break out."

To what dire resources the alarmists at length had to recur, is thus related by this unconcealing writer:

"Colonel Quarrell\*, who had been upon service with the troops in the mountains, was compelled by the state of his health to leave the head-quarters, and to go down to the sea-shore. There he met with an intelligent Spaniard, who, talking with him on the state of the island, related an event, to which colonel Quarrell paid the utmost attention, as he thought the ideas it suggested might prove of importance to the country. It seems that some years before, when the British abandoned the Musquito-shore to the Spaniards, the latter were opposed by the native Indians, who had always shown the most determined enmity to them. They attempted in vain to take possession of the country by means of a military force: in the course of a very few months they lost, from surprises and ambushes, nearly three regiments. Compelled to abandon the place, or fall upon some plan of counteracting the Indian warfare, they imported from Cuba 36 dogs and 12 chasseurs, who were sent by the *alcalde provincial*†, at the desire of Don Juan Despolito, the governor of the Havanna. These auxiliaries were more formidable than the finest regiment of the most warlike nation could have been; and from the time of their being employed, neither surprise nor ambush annoyed the troops, the Spaniards soon succeeded in expelling the Musquito Indians from the territory on the coast, and quietly occupied Black River, Blue-fields, and Cape Gracias a Deos. In whatever light the philanthropist may view means of the gentlest kind when used to drive men from their native lands, he cannot justly blame the harshest adopted at home, when self-preservation is the end proposed. Had the case been reversed, had the Indians employed dogs in driving away the Spaniards and keeping them from their country, satisfaction, and not horror, would have been the emotion excited. It occurred to colonel Quarrell, that the assistance of a certain number of the Cuba chasseurs would be attended with happy effects: he foresaw that the very terror they would spread would induce the Maroons to submit on proper terms; and he argued, that even if the commander in chief were compelled to bring them into actual service, it would be better, and more for the interest of humanity, that some of the rebels should be thus destroyed, than that the most barbarous massacres should be committed on the inhabitants, and the colony ruined. Swayed by these motives, he suggested the

\* Colonel Quarrell wished me not to entitle him according to his military rank, which he considered as temporary; but the time of which I treat fully justifies my giving him the title of the rank he then held, and still holds, if he were called into service.

† The high-constable of the province whence the dogs and chasseurs came.

scheme to the speaker and several members of the house of assembly, to be laid before the lieutenant-governor. The house, however, misconceived the plan: in their anxiety to spare the lives of the troops in so unequal a warfare, they approved of the means proposed, but contented themselves with recommending that a pecuniary encouragement should be given to the Spaniards trading to the north side of the island, to bring over a few dogs, in order to see what effect the importation would have. Colonel Quarrell, who had now retained the Spaniard with whom he had conversed, and two others in his pay, represented the inutility of this measure, pressed the conducting of the business on surer grounds and a more extensive plan, and, having obtained full information on the subject, offered to take the business upon himself, provided he were furnished with a vessel and a letter from the governor of Jamaica to the Spanish governor at the Havanna, requesting permission for him to purchase dogs. The government, having taken the offer into consideration, acceded to the proposal; a schooner called the *Mercury*, carrying twelve guns, was sent down to Bluefields, an open road at the western extremity of Jamaica; and a letter was transmitted to colonel Quarrell, addressed to don Luis de las Casas, the governor at the Havanna, recommending the bearer of it to his attentions as a commissioner for the purposes mentioned in it, and likewise as a member of the legislature, and a lieutenant-colonel of the troops. When the captain of the vessel delivered his dispatches, the commissioner was ill with a fever: but so anxious was he that nothing should delay the service, that he immediately went on board, and the captain requesting orders for the time of sailing, he answered, that instant. The crew of the schooner consisted of four British seamen, twelve Curaçoa negroes, and eighteen Spanish renegadoes; but notwithstanding the unpromising, or rather alarming appearance of such a set of men, the commissioner, with a friend, whom he had invited to accompany him on the voyage, and their two servants, embarked at Bluefields in the end of the month of October 1795.

“Let us now take leave of general Walpole and the Trelawney mountains, of the Maroons and the cockpits, for a few weeks; let us set sail in the schooner, and let us accompany the commissioner in his expedition to Cuba, remembering, at the same time, that the sole object of it was to quell the Maroon rebellion. We will not, however, take our departure till we have investigated the justice of the means proposed for the end in view. The argument has been stated thus:

“The assembly of Jamaica were not apprized that the measure of calling in such

auxiliaries, and using the canine species against human beings, would give rise to much animadversion in England; and that the horrible enormities of the Spaniards in the conquest of the new world, would be brought again to remembrance. It is but too true, that dogs were used by those christian barbarians against the peaceful and inoffensive Americans, and the just indignation of mankind has ever since branded, and will continue to brand, the Spanish nation with infamy, for such atrocities. It was foreseen, and strongly urged as an argument against recurring to the same means in the present case, that the prejudices of party, and the virulent zeal of restless and turbulent men, would place the proceedings of the assembly on this occasion, in a point of view equally odious with the conduct of Spain on the same blood-stained theatre, in times past. No allowance would be made for the wide difference existing between the two cases. Some gentlemen even thought that the co-operation of dogs with British troops, would give not only a cruel, but a very dastardly complexion to the proceedings of government.

“To these and similar objections, it was answered, that the safety of the island and the lives of the inhabitants were not to be sacrificed to the apprehension of perverse misconstruction or wilful misrepresentation in the mother country. It was maintained, that the grounds of the measure needed only to be fully examined, and fairly stated, to induce all reasonable men to admit its propriety and necessity. To hold it as a principle, that it is an act of cruelty or cowardice in man to employ other animals as instruments of war, is a position contradicted by the practice of all nations. The Asiatics have ever used elephants in their battles; and if lions and tygers possessed the docility of the elephant, no one can doubt that these also would be made to assist the military operations of man, in those regions where they abound. Even the use of cavalry, as established among the most civilized and polished nations of Europe, must be rejected, if this principle be admitted; for wherein, it was asked, does the humanity of that doctrine consist, which allows the employment of troops of horse in the pursuit of discomfited and flying infantry, yet shrinks at the preventive measure of sparing the effusion of human blood, by tracing with hounds the haunts of murderers, and rousing from ambush, savages more ferocious and blood-thirsty than the animals which track them?”

The doctrine nakedly avowed by this author is, that the philanthropist cannot justly blame the harshest means, when self-preservation is the end proposed. This is bad historical morality.

“† Captain Gilpin of the militia.

In the first place, self-preservation is not a justifiable ultimate end; and life itself is occasionally to be sacrificed, when its preservation would involve a breach of general laws, which it is important to avoid the precedent of violating. In the next place, all preservation is to be accomplished by the mildest adequate means; and the philanthropist may justly blame not only the harshest, but the gentlest inflictions, which are not essential to the end proposed. The only ground for employing these dogs to track the Maroons to their hiding-places, a practice formerly common on the borders of Scotland, is, that no speedier and milder method could be devised of apprehending individuals, whom it was become necessary to transplant, after they had been wickedly or ignorantly irritated and terrified into a state of ferocious insurrection, which rendered them formidable to the lives of all the contiguous proprietors. It may however be suspected that these dogs were not intended merely to track the Maroons, for the importation of them excited an extraordinary degree of terror.

"On the 16th of March four Maroons dispatched by Johnson arrived at Old Maroon-Town, and informed general Walpole that he was on his way with the whole remaining body of the Maroons. Some of them being hog-hunting, they could not be all collected at once; but on the 21st, Parkinson, with thirty-six of his party, surrendered, bringing with them forty-four stands of arms. The whole number now remaining in the woods was thirteen, and these, with the rest of the runaways, surrendered next day. Thus concluded hostilities, without recourse being once had to the assistance of the chasseurs, beyond the operation of the terror they inspired, but which it was very evident had been the means of producing the treaty, and of accelerating the surrender of the several bodies whose distrust kept them back so long after it was made; and who, as they gradually came in, always required that the Spaniards and dogs should be removed, and separated from them by a line of the troops. One knows not which to admire most, the activity and ad-

dress with which they were procured, or the humanity that in spite of three months provocation prevented their being employed in action\*. To the skill, temper, and benevolence of general Walpole are the colonists, whom he had a little before saved from humiliation, indebted for this bloodless triumph; and to William Dawes Quarrell are they indebted for suggesting, and procuring the means by which the island was saved from destruction. 'We cannot but take this opportunity,' say the assembly, in requesting the lieutenant-governor to give orders for the dismissal of the chasseurs, 'of expressing our acknowledgments of the eminent advantages derived from the importation of the chasseurs and dogs, in compliance with the general wishes of the island. Nothing can be clearer, than that if they had been off the island, the rebels could not have been induced to surrender, from their almost inaccessible fastnesses. We are happy to have it in our power to say, that terror excited by the appearance of the dogs, has been sufficient to produce so fortunate an event; and we cannot but highly approve that attention to humanity so strongly proved by their being ordered in the rear of the army.'

The determination to transplant some of these unfortunate people into Canada, a climate so ill adapted for their constitutions, was surely unnatural. The partial transfer of them to Sierra Leone was more praiseworthy: yet we should have preferred the continent of South America, where there are other Maroons. Just observations are made by Mr. Dallas on the state of the interior and mountainous districts of Jamaica. He thinks them adapted by climate for white settlers, and has no doubt that if emigration was directed thither, it would speedily find the means of profitable subsistence. Is not the preliminary step to the colonization of the Jamaican highlands this?—that the richer planters, domesticated in the lowlands, should make it a matter of luxury to build villas in the more picturesque mountain-districts, and to inhabit them during the feverish and sultry season. Plantations of mahogany and other precious woods would result; then sawing-mills, roads, dairy-farms, vine-yards, and all the arts of cultivation.

"\* It is hardly worth while to mention an accident by which an old woman lost her life, but it has been suggested that the omission of it may receive an unfavourable construction. One of the dogs that had been unmuzzled to drink when there was not the least apprehension of any mischief, went up to the woman, who was sitting attending to a pot in which she was preparing a mess. The dog smelled at it, and was troublesome; this provoked her, she took up a stick and began to beat him, on which he seized on her throat, which he would not let go till his head was severed from his body by his master. The wind-pipe of the woman being much torn, she could not be saved.

The appendix to each volume contains many curious papers; such as an act for consolidating all the acts relative to slaves; Mr. Quarrell's answer to the chairman of the Maroon committee; and

various interesting papers of correspondence. The whole work is curious, interesting, instructive; but less distinguished for the moral taste of its sentiments, than for the sincerity of its narrations.

### GENERAL POLITICS.

ART. XVII. *An Essay on the Principles of Population; or, a View of its past and present Effects on human Happiness.* By T. R. MALTHUS, Fellow of Jesus College, Cambridge. 4to. pp. 610.

THE public opinion has already been pronounced upon the merits of this Essay. Mr. Malthus embarked upon the tide just at the happy moment, at the flood when it leads on to fortune, and such was the unnatural and unwholesome state of our moral and political atmosphere, that he appeared like a philosopher, as he would have appeared like a giant had he walked abroad in a *mirage*.

No wise man had ever doubted, and no christian had ever disbelieved, that the general condition of mankind could be improved, till the unhappy consequences of the French revolution shook the liberties and morals of Europe. This amelioration was rendered probable to the good by reason, and certain by faith; they religiously expected what they benevolently desired. For these rational and righteous hopes, men who had no faith and little reason, substituted wild speculations how men might live for ever; and these speculations were combated by those who had just reason enough to expose the absurdity of their antagonists, and just faith enough to raise an outcry against their infidelity.

Mr. Malthus's object is to refute the opinion of the perfectibility of man, in other words, to prove that no material improvement can ever be expected in the state of society.

"In an inquiry concerning the future improvement of society, the mode of conducting the subject which naturally presents itself, is

"1. An investigation of the causes that have hitherto impeded the progress of mankind towards happiness; and

"2. An examination into the probability of the total or partial removal of these causes in future.

"To enter fully into this question, and to enumerate all the causes that have hitherto influenced human improvement, would be much beyond the power of an individual. The principal object of the present essay is to examine the effects of one great cause intimately united with the very nature of man, which, though it has been constantly and powerfully operating since the commence-

ment of society, has been little noticed by the writers who have treated this subject. The facts which establish the existence of this cause have, indeed, been repeatedly stated and acknowledged; but its natural and necessary effects have been almost totally overlooked; though probably among these effects may be reckoned a very considerable portion of that vice and misery, and of that unequal distribution of the bounties of nature, which it has been the unceasing object of the enlightened philanthropist in all ages to correct.

"The cause to which I allude, is the constant tendency in all animated life to increase beyond the nourishment prepared for it."

"Taking the whole earth instead of this island, emigration would of course be excluded; and supposing the present population equal to a thousand millions, the human species would increase as the numbers 1, 2, 4, 8, 16, 32, 64, 128, 256, and subsistence as 1, 2, 3, 4, 5, 6, 7, 8, 9. In two centuries the population would be to the means of subsistence as 256 to 9; in three centuries as 4096 to 13, and in two thousand years the difference would be almost incalculable."

This last paragraph is the sum and substance of eight quarto pages; and in fact, the whole work is written in the same ratio: viz. eight lines of sense and substance to  $8 \times 30 = 240$  lines of verbiage and senseless repetition; and even of these eight lines, all the pomp of numerals and ratios might have been cashiered by substituting a proposition which no one in his senses would consider as other than axiomatic. Suppose a married couple to have six children, (not half the number which they would have if you suppose *all* checks to population removed) and suppose all their posterity to marry, and each couple to increase in the same proportion; and it is evident on the slightest reflection, that in a given number of generations, their posterity would want standing room. (That it must be so, the rule of multiplication would enable a child to demonstrate, and a school-boy who has advanced in arithmetic as far as com-

pound interest, may astonish his younger sister both by the fact, and by the exact number of years in which it would take place.) On the other hand, let the productiveness of the earth be increased beyond the hopes of the most visionary agriculturist, still the productions take up room: if the present crop of turnips occupy one-fifth of the space of the turnip field, the increase can never be more than quintuple; and if you suppose two harvests for one, the increase still cannot exceed ten: so that supposing a little island of a single acre, and its productions occupying one-fifth of its absolute space, and sufficient to maintain two men and two women, four generations would outrun its possible power of furnishing them with food. We may boldly affirm that a truth so self-evident as this, was never overlooked, or even by implication contradicted. What proof has Mr. Malthus brought, what proof can he bring, that every writer or theorist has overlooked this fact, which would not apply (with reverence be it spoken) to the Almighty himself, when he pronounced the awful command, 'Increase and multiply?'

From page 17 to page 355, Mr. Malthus retails and details from others' travels, and from his own, facts of all nations and all ages, in all states of society, to prove that men have suffered, and are suffering, from ignorance, filth, famine, diseases, large cities, unwholesome employment, superstition, bad passions, bad habits, bad laws, and bad government; that all these have made men wicked, and poor, and miserable; and that men in wickedness, and misery, and dearth of subsistence, do not rear, even if they beget, as large families as happy and good people would do. Now we put it seriously to Mr. Malthus's good sense, whether or no, if he had simply stated this in one sentence of half-a-dozen, or half-a-score lines, any one individual in Europe would have felt the least inclination to contradict the statement? The whole of these pages would make a sensible first sentence of an essay in a newspaper on the subject of population; (for it is right to begin with a statement which no one can, or can wish to controvert,) but 355 quarto pages to say it out in!—The Minerva press, and his Majesty's law-printers are not more merciless to paper and printers' ink.

This mighty discovery Mr. Malthus opposes to all good feelings and all good hopes, with this he triumphantly destroys all arguments for all amelioration of the state of the human race. It is brought in its full force against Mr. Godwin. This was the original mark and object of the work, and it is to this that Mr. Malthus owes his present high reputation: long as the passage is we shall therefore give it at length.

"Let us imagine for a moment, Mr. Godwin's system of equality realised in its utmost extent, and see how soon this difficulty might be expected to press, under so perfect a form of society. A theory that will not admit of application cannot possibly be just.

"Let us suppose all the causes of vice and misery in this island removed. War and contention cease. Unwholesome trades and manufactories do not exist. Crowds no longer collect together in great and pestilent cities, for purposes of court intrigue, of commerce, and vicious gratification. Simple, healthy, and rational amusements, take place of drinking, gaming, and debauchery. There are no towns sufficiently large, to have any prejudicial effects on the human constitution. The greater part of the happy inhabitants of this terrestrial paradise live in hamlets and farm houses, scattered over the face of the country. All men are equal. The labours of luxury are at an end; and the necessary labours of agriculture are shared amicably among all. The number of persons and the produce of the island we suppose to be the same as at present. The spirit of benevolence guided by impartial justice, will divide this produce among all the members of society according to their wants. Though it would be impossible that they should all have animal food every day, yet vegetable food, with meat occasionally, would satisfy the desires of a frugal people, and would be sufficient to preserve them in health, strength, and spirits.

"Mr. Godwin considers marriage as a fraud, and a monopoly.\* Let us suppose the commerce of the sexes established upon principles of the most perfect freedom. Mr. Godwin does not think himself, that this freedom would lead to a promiscuous intercourse; and in this, I perfectly agree with him. The love of variety is a vicious, corrupt, and unnatural taste, and could not prevail, in any great degree, in a simple and virtuous state of society. Each man would probably select for himself a partner, to whom he would adhere, as long as that adherence continued to be the choice of both parties. It would be of little consequence, according to Mr. Godwin, how many children a woman had, or to whom they belong-

\* Political Justice, b. viii. c. viii. p. 493. et seq.

ed. Provisions and assistance would spontaneously flow from the quarter in which they abounded, to the quarter in which they were deficient.\* And every man, according to his capacity, would be ready to furnish instruction to the rising generation.

"I cannot conceive a form of society so favourable, upon the whole, to population. The irremediableness of marriage, as it is at present constituted, undoubtedly deters many from entering into this state. An unshackled intercourse, on the contrary, would be a most powerful incitement to early attachments: and as we are supposing no anxiety about the future support of children to exist, I do not conceive there would be one woman in a hundred, of twenty-three years of age, without a family.

"With these extraordinary encouragements to population, and every cause of depopulation, as we have supposed, removed, the numbers would necessarily increase faster than in any society that has ever yet been known. I have before mentioned, that the inhabitants of the back settlements of America appear to double their numbers in fifteen years. England is certainly a more healthy country than the back settlements of America; and as we have supposed every house in the island to be airy and wholesome, and the encouragements to have a family, greater even than in America, no probable reason can be assigned, why the population should not double itself, in less, if possible, than fifteen years. But to be quite sure that we do not go beyond the truth, we will only suppose the period of doubling to be twenty-five years; a ratio of increase which is well known to have taken place throughout all the northern states of America.

"There can be little doubt, that the equalization of property which we have supposed, added to the circumstance of the labour of the whole community being directed chiefly to agriculture, would tend greatly to augment the produce of the country. But to answer the demands of a population increasing so rapidly, Mr. Godwin's calculation of half an hour a day would certainly not be sufficient. It is probable, that the half of every man's time must be employed for this purpose. Yet with such, or much greater exertions, a person who is acquainted with the nature of the soil in this country, and who reflects on the fertility of the lands already in cultivation, and the barrenness of those that are not cultivated, will be very much disposed to doubt, whether the whole average produce could possibly be doubled in twenty-five years from the present period. The only chance of success would be from the ploughing up most of the grazing countries, and putting an end almost entirely to animal food. Yet this scheme would probably defeat itself. The soil of England will not produce much without dressing; and

cattle seem to be necessary to make that species of manure which best suits the land.

"Difficult, however, as it might be, to double the average produce of the island in twenty-five years, let us suppose it effected. At the expiration of the first period, therefore, the food, though almost entirely vegetable, would be sufficient to support in health the doubled population of 22 millions.

"During the next period, where will the food be found to satisfy the importunate demands of the increasing numbers? Where is the fresh land to turn up? Where is the dressing necessary to improve that which is already in cultivation? There is no person with the smallest knowledge of land, but would say, that it was impossible that the average produce of the country could be increased during the second twenty-five years, by a quantity equal to what it at present yields. Yet we will suppose this increase, however improbable, to take place. The exuberant strength of the argument allows of almost any concession. Even with this concession, however, there would be eleven millions at the expiration of the second term unprovided for. A quantity equal to the frugal support of 33 millions would be to be divided among 44 millions.

"Alas! what becomes of the picture, where men lived in the midst of plenty, where no man was obliged to provide with anxiety and pain for his restless wants; where the narrow principles of selfishness did not exist; where the mind was delivered from her perpetual anxiety about corporeal support, and free to expatiate in the field of thought which is congenial to her. This beautiful fabrick of the imagination vanishes at the severe touch of truth. The spirit of benevolence, cherished and invigorated by plenty, is repressed by the chilling breath of want. The hateful passions that had vanished reappear. The mighty law of self-preservation expels all the softer, and more exalted emotions of the soul. The temptations to evil are too strong for human nature to resist. The corn is plucked before it is ripe, or sown in unfair proportions; and the whole black train of vices that belong to falsehood are immediately generated. Provisions no longer flow in for the support of a mother with a large family. The children are sickly from insufficient food. The rosy flush of health gives place to the pallid cheek, and hollow eye of misery. Benevolence, yet lingering in a few bosoms, makes some faint expiring struggles, till at length self-love resumes his wonted empire, and lords it triumphant over the world.

"No human institutions here existed, to the perverseness of which Mr. Godwin ascribes the original sin of the worst men.† No opposition had been produced by them between publick and private good. No monopoly had been created of those advantages

\* Political Justice, b. viii. c. viii. p. 504. † Ib. c. iii. p. 340.

which reason directs to be left in common. No man had been goaded to the breach of order by unjust laws. Benevolence had established her reign in all hearts. And yet in so short a period as fifty years, violence, oppression, falsehood, misery, every hateful vice, and every form of distress, which degrade and sadden the present state of society, seem to have been generated by the most imperious circumstances, by laws inherent in the nature of man, and absolutely independent of all human regulations.

"If we be not yet too well convinced of the reality of this melancholy picture, let us but look for a moment into the next period of twenty-five years, and we shall see 44 millions of human beings without the means of support: and at the conclusion of the first century, the population would be 176 millions, and the food only sufficient for 55 millions, leaving 121 millions unprovided for. In these ages, want, indeed, would be triumphant, and rapine and murder must reign at large: and yet all this time we are supposing the produce of the earth absolutely unlimited, and the yearly increase greater than the boldest speculator can imagine."

The pop-gun made a loud report in the world, and effectually smote down the champion against whom it was levelled. Mr. Malthus could not have obtained more credit in the eighth century for laying the devil, than he has in the eighteenth for laying Mr. Godwin. The question contended was, whether or not there were any hopes of mankind; whether wisdom would be progressive with knowledge, and virtue with wisdom, and happiness with virtue. Shame on the age we live in that this question should be disputed! Shame on the country we live in, that such a question should be debated by no better advocates than Messrs. Godwin and Malthus! Menelaus and Paris were not more unworthy representatives of the collected heroism of Greece and Troy, than these men of the knowledge and intellect of England. To Mr. Godwin's presumption his antagonist is indebted for his victory; only such a Goliath could have called forth such a David. Mr. Godwin had confounded together all principles pure and impure; he had attempted to amalgamate stoicism and sensuality; he had diluted the wisdom of the antients with his own folly; he had kneaded up their wheat, and barley, and millet, with his own *album græcum*, and this precious wafer was to be swallowed as the bread of life—the sacrament of philosophy! What wonder that this should inspire equal talents with the hope of

equal success? If the Nervous Cordial sells, so also may the Balm of Gilead. Dr. Solomon is perfectly justifiable in calling Dr. Brodum a quack; and in the country where one of these worthies can ride in his carriage, it must be the other's own fault if he continues to walk a-foot. "Mr. Malthus appeared, and we heard no more of Mr. Godwin,"—so it was said in that style of panegyric which may be called the brief sublime. And indeed Mr. Godwin himself has admitted the whole force of his antagonist's argument.

In animals, the benevolent system of destruction keeps down their numbers to a due proportion with their food. Wisely did the Hindoos unite the creator, the preserver, and the destroyer, in their triunal God,—and what better proof of wisdom and benevolence than that death should be made subservient to life? No such check exists to the multiplication of the human race, but among them moral and physical evil (each producing the other in alternation) supply its place, till wisdom having perfected virtue, shall destroy all evil by rendering it no longer necessary. An optimist might thus express the substance of his creed. Mr. Malthus also is an optimist, but of the Pangloss school, holding that the present state of society is, with all its evils, the best of all possible states, and that it never can be better. To some such point of attainable perfection, for arguments sake, he supposes the human race to have attained, and then attempting the *reductio ad absurdum*, he argues against the blessing from its excess. The principle of population, he says, would in one generation disturb, and in a second, destroy this state of happiness, and mankind must then revert to the present system. Mr. Godwin yields, proposing, however, exposure and abortion as remedies; but these, says his victorious rival, "clearly come under the head of vice."

It is to the last degree idle to write in this way without having stated the meaning of the words vice and virtue. That these are vices in the present state of society, who doubts? so was celibacy in the patriarchal ages. Vice and virtue subsist in the agreement of the habits of a man with his reason and conscience, and these can have but one moral guide—utility, or the virtue and happiness of rational beings. We mention this, not under the miserable notion that any state of society will render these actions capable of being performed with con-

science and virtue, but to expose the utter ungroundedness of the writer's speculation: adding, however, that if we believed with Mr. Malthus's warmest partizans, that men never will in general be capable of regulating the sexual appetite by the law of reason, and that the gratification of lust is a thing of physical necessity, equally with the gratification of hunger, (a faith which we should laugh at for its silliness, if its wickedness had not pre-excited abhorrence) nothing would be more easy than to demonstrate that abortion, or the exposure of children, or artificial sterility on the part of the male, would become virtues:—a thought which we turn from with loathing, but not with greater loathing than we do from the degrading theory of which it would be a legitimate consequence. By a yet stronger inconsequence, this theory (so far as it is aimed against the hopes of the progressive improvement of mankind) pleads for the existence, not only of these vices, but of a thousand others, and of the brutal ignorance and misery, the production of which does alone render these actions crimes: it pleads for the continuance of all this misery whereof these very vices form a part, in order to prevent that state of society, in which, admitting one or other of these actions after the birth of every second or third child, the whole earth might be imagined filled to its utmost extent with enlightened and happy beings.

If then Mr. Malthus's reasoning were just, the application would be absurd, for what can be more absurd than to abandon all hope of this attainable state of happiness because certain evils would exist in it, and therefore to remain contented with the continuance of those very evils, and of all the other evils which, upon the admitted hypothesis, would be removed? What should we say to the physician who should object to the cow-pox, and to all remedies for scrofula and syphilis, for fear that when these diseases were annihilated, men should become plethoric and subject to apoplexy from excess of health?

But the reasoning is as absurd as the application: the whole proceeds upon the assumption, that lust and hunger are alike passions of physical necessity, and the one equally with the other independent of the reason and the will. If this were true, chastity could not exist; fornication would be as indispensable as

food, every single man must be a brotheller, every single woman a strumpet. There lives not a wretch corrupt enough of heart, and shameless enough of front to say that this is so: there lives not a man who can look upon his wife and his daughter, who can think upon his sister, and remember her who bore him, without feeling indignation and resentment that he should be insulted by so infamous an assertion. But if the possibility of chastity be admitted (and it will be seen that Mr. Malthus does hereafter fully admit it) the whole argument against the system of equality, against the perfectibility, or to use a more accurate and less obnoxious term, the improveability of man, falls to the ground. Mr. Godwin has been knocked down by the wind of the pop-gun, the pellet has missed him. Drawcansir is driven off the stage, and his enemies may get up and dance.

Having thus rescued the philosopher from the Philistines, let us try the truth of Mr. Malthus's principle as applied against all those who hope for any reformation in the state of society.

"The power of population is so superior to the power in the earth to produce subsistence for man, that, unless arrested by the preventive check, premature death must in some shape or other visit the human race. The vices of mankind are active and able ministers of depopulation. They are the precursors in the great army of destruction, and often finish the dreadful work themselves. But should they fail in this war of extermination, sickly seasons, epidemics, pestilence, and plague, advance in terrific array, and sweep off their thousands and ten thousands. Should success be still incomplete, gigantic inevitable famine stalks in the rear, and, with one mighty blow, levels the population with the food of the world.

"Must it not then be acknowledged, by an attentive examiner of the histories of mankind, that, in every age, and in every state in which man has existed, or does now exist,

"The increase of population is necessarily limited by the means of subsistence?

"Population invariably increases when the means of subsistence increase, unless prevented by powerful and obvious checks.

"These checks, and the checks which keep the population down to the level of the means of subsistence, are, moral restraint, vice, and misery."

\* \* \* \*

"The great error under which Mr. Godwin labours, throughout his whole work, is, the attributing of almost all the vices and misery that prevail in civil society to human institutions, Political regulations, and the

established administration of property, are, with him, the fruitful sources of all evil, the hotbeds of all the crimes that degrade mankind. Were this really a true state of the case, it would not seem an absolutely hopeless task, to remove evil completely from the world; and reason seems to be the proper and adequate instrument, for effecting so great a purpose. But the truth is, that, though human institutions appear to be the obvious and obtrusive causes of much mischief to mankind, they are, in reality, light and superficial, in comparison with those deeper-seated causes of evil which result from the laws of nature."

\* \* \* \*

"The circulation of Paine's Rights of Man, it is supposed, has done great mischief among the lower and middling classes of people in this country. This is probably true; but not because man is without rights, or that these rights ought not to be known; but because Mr. Paine has fallen into some fundamental errors respecting the principles of government, and in many important points has shewn himself totally unacquainted with the structure of society, and the different moral effects to be expected from the physical difference between this country and America. Mobs, of the same description as those collections of people known by this name in Europe, could not exist in America. The number of people without property, is, there, from the physical state of the country, comparatively small; and therefore the civil power which is to protect property, cannot require the same degree of strength. Mr. Paine very justly observes, that whatever the apparent cause of any riots may be, the real one is always want of happiness; but when he goes on to say, it shews that something is wrong in the system of government, that injures the felicity by which society is to be preserved, he falls into the common error of attributing all want of happiness to government. It is evident, that this want of happiness might have existed, and from ignorance might have been the principal cause of the riots, and yet be almost wholly unconnected with any of the proceedings of government."

Mr. Malthus has ravelled together his truisms and his sophisms with some intricacy, but it is not so difficult as he may suppose to disentangle them. We admit the whole extent of the vice and misery in the world; he has not in the slightest point exaggerated it. It remains to be seen whether human institutions, or the laws of nature be in fault; it remains to be seen (we speak with reverence and not without indignation) whether we are to complain of the folly of man, or of the will of God, for this is the alternative. Let not the impiety of the question be imputed to us!

It has been amply shewn by this author; and it never was denied or doubted, that in all ages and in all states of society, men have suffered, and are suffering, from ignorance, filth, famine, diseases, large cities, unwholesome employment, superstition, bad passions, bad habits, bad laws, and bad governments, and that some or other of these causes have every where, and at all times, checked population, and do still continue to check it. "The period," says he, "when the number of men surpass their means of subsistence has long since arrived, and this constantly subsisting cause of periodical misery has existed ever since we have had any histories of mankind, does exist at present, and will for ever continue to exist, unless some decided change take place in the *physical constitution of our nature*." If for these last words we substitute the *existing systems of society*, we shall convert the sentence into truth.

In New Holland, where there does not exist a man to a square mile, the number of men exceeds their means of subsistence. What is required to remedy the evil here, and to make the natives increase as rapidly as the Anglo-Americans—a change in their physical or in their moral nature? In England the inhabitants might be trebled, and the island still produce enough for the comfortable subsistence of all; yet in England population is checked, a great part of the people are in want, and every profession, trade, and calling, whereby man or woman can earn support, is overstocked. Where lies the fault if New Holland be not as fully peopled in proportion as England, if England be not as fully peopled in proportion as China, if China be not peopled in the fullest proportion, not to its actual, but to its possible powers of production? Is it in human institutions, or in the laws of nature? Is it in man or in God? *Wilt thou condemn me that thou mayest be righteous*, said the Lord: who is he that will dare answer the question in Mr. Malthus's behalf? If a country be overpeopled, and crowded, and distressed, in regard to its system of society, before it be half peopled in proportion to its size and power of production; the fault lies in that system of society, not in the system of nature. If, while not a tenth, nay not an hundredth part of the habitable world be cultivated, mankind be every where in want, the fault is their

own. All that Mr. Malthus has done is to prove that radical evil in society which his whole work is designed to palliate.

Till the whole earth be peopled to its utmost capacity, it is the fault of man if any check to population exist, except such as are dispensed by the elements and the operations of physical nature: his moral nature is in his own power, and it hath been said, "Be ye perfect, even as your father in heaven is perfect."

So much for Mr. Malthus's argument against the hopes of the human race! It has been demonstrated that all checks to population, till the power of production can be pushed no farther, and actual room for farther increase be wanting, must be attributed to error and ignorance in man, not to unerring nature and omniscient goodness. When that point has been reached, it has been demonstrated that the practice of one virtue will secure the happiness of mankind and render it permanent. Either chastity is possible, or it is not; in the one case his argument has been shown to be groundless, in the other inapplicable: one of the horns of this dilemma must wound him, and either wound must be mortal. He has played off his positive check and his preventive check, but they have not saved him from this check-mate.

By these miserable sophisms Mr. Malthus has obtained the high reputation which he at present enjoys; his book having become the political bible of the rich, the selfish, and the sensual; nor need we wonder that so contemptible a book should have produced so much mischief: if the body be corrupt and predisposed to mortification, a scratch will occasion death. But to our utter astonishment we find that, though in this present edition the author has retained and enlarged all these arguments, and insisted upon their application; at the end of the volume he admits every thing which he has controverted in the beginning, and is clearly and confessedly a convert to the doctrine of the perfectibility of man! He draws a picture of christian society, in which the well being of all is founded upon this very virtue of chastity, the non-existence of which was to destroy all the theories of Godwin and Condorcet.

"The difficulty of moral restraint, will perhaps be objected to this doctrine. To him who does not acknowledge the authority

of the christian religion, I have only to say, that, after the most careful investigation, this virtue appears to be absolutely necessary, in order to avoid certain evils which would otherwise result from the general laws of nature. According to his own principles, it is his duty to pursue the greatest good consistent with these laws; and not to fail in this important end, and produce an overbalance of misery, by a partial obedience to some of the dictates of nature while he neglects others. The path of virtue, though it be the only path which leads to permanent happiness, has always been represented by the heathen moralists, as of difficult ascent.

"To the christian I would say, that the scriptures most clearly and precisely point it out to us as our duty, to restrain our passions within the bounds of reason; and it is a palpable disobedience of this law, to indulge our desires in such a manner, as reason tells us, will unavoidably end in misery. The christian cannot consider the difficulty of moral restraint as any argument against its being his duty; since in almost every page of the sacred writings, man is described as encompassed on all sides by temptations, which it is extremely difficult to resist; and though no duties are enjoined, which do not contribute to his happiness on earth as well as in a future state, yet an undeviating obedience is never represented as an easy task."

"In a society, such as I have supposed, all the members of which endeavour to attain happiness by obedience to the moral code, derived from the light of nature, and enforced by strong sanctions in revealed religion, it is evident that no such marriages could take place; and the prevention of a redundant population, in this way, would remove one of the principal causes, and certainly the principal means of offensive war; and at the same time tend powerfully to eradicate those two fatal political disorders, internal tyranny and internal tumult, which mutually produce each other.

"Weak in offensive war, in a war of defence, such a society would be strong as a rock of adamant. Where every family possessed the necessaries of life in plenty, and a decent portion of its comforts and conveniences, there could not exist that hope of change, or at best that melancholy and disheartening indifference to it, which sometimes prompts the lower classes of people to say, 'let what will come, we cannot be worse off than we are now.' Every heart and hand would be united to repel an invader, when each individual felt the value of the solid advantages which he enjoyed, and a prospect of change presented only a prospect of being deprived of them.

"As it appears, therefore, that it is in the power of each individual to avoid all the evil consequences to himself and society resulting from the principle of population, by the practice of a virtue clearly dictated to him by the light of nature, and expressly enjoined

in revealed religion ; and as we have reason to think that the exercise of this virtue to a certain degree, would rather tend to increase than diminish individual happiness ; we can have no reason to impeach the justice of the Deity, because his general laws make this virtue necessary, and punish our offences against it by the evils attendant upon vice, and the pains that accompany the various forms of premature death. A really virtuous society, such as I have supposed, would avoid these evils. It is the apparent object of the Creator to deter us from vice by the pains which accompany it, and to lead us to virtue by the happiness that it produces. This object appears to our conceptions to be worthy of a benevolent Creator. The laws of nature respecting population, tend to promote this object. No imputation, therefore, on the benevolence of the Deity, can be founded on these laws, which is not equally applicable to any of the evils necessarily incidental to an imperfect state of existence."

Wherein then does Mr. Malthus differ from those who maintain the perfectibility of man ? that is, who believe a state of society to be possible, in which every man shall enjoy as much happiness as his physical and moral powers are capable of enjoying ; that happiness being regulated by and subservient to the general welfare ? If man can retain his passions in a conceivable state of knowledge, what is to stop his improvement ? The latter part of his book therefore palpably confutes the former, and he perishes by a stupid suicide, like the scorpion who strikes his tail into his own head.

We are now then to rank Mr. Malthus among the political reformers : he has discovered that moral restraint is practicable, and that it is a remedy equivalent to the evil of a redundant population. Let us see how he applies this principle.

"When the wages of labour are hardly sufficient to maintain two children, a man marries and has five or six. He of course finds himself miserably distressed. He accuses the insufficiency of the price of labour to maintain a family. He accuses his parish for their tardy and sparing fulfilment of their obligation to assist him. He accuses the avarice of the rich, who suffer him to want what they can so well spare. He accuses the partial and unjust institutions of society, which have awarded him an inadequate share of the produce of the earth. He accuses perhaps the dispensations of Providence, which have assigned to him a place in society so beset with unavoidable distress and dependence. In searching for objects of accusation, he never adverts to the quarter from

which all his misfortunes originate. The last person that he would think of accusing is himself, on whom, in fact, the whole of the blame lies, except in as far as he has been deceived by the higher classes of society. He may perhaps wish that he had not married, because he now feels the inconveniences of it ; but it never enters into his head that he can have done any thing wrong. He has always been told that to raise up subjects for his king and country is a very meritorious act. He has done this act, and yet is suffering for it. He naturally thinks that he is suffering for righteousness sake ; and it cannot but strike him as most extremely unjust and cruel in his king and country, to allow him thus to suffer, in return, for giving them what they are continually declaring that they particularly want.

"Till these erroneous ideas have been corrected, and the language of nature and reason has been generally heard on the subject of population, instead of the language of error and prejudice, it cannot be said that any fair experiment has been made with the understandings of the common people ; and we cannot justly accuse them of improvidence and want of industry, till they act as they do now, after it has been brought home to their comprehensions, that they are themselves the cause of their own poverty ; that the means of redress are in their own hands, and in the hands of no other persons whatever ; that the society in which they live, and the government which presides over it, are totally without power in this respect ; and however ardently they may desire to relieve them, and whatever attempts they may make to do so, they are really and truly unable to execute what they benevolently wish, but unjustly promise ; that when the wages of labour will not maintain a family, it is an incontrovertible sign that their king and country do not want more subjects, or at least that they cannot support them ; that if they marry in this case, so far from fulfilling a duty to society, they are throwing a useless burden on it, at the same time that they are plunging themselves into distress ; and that they are acting directly contrary to the will of God, and bringing down upon themselves various diseases, which might all, or in a great part, have been avoided, if they had attended to the repeated admonitions which he gives, by the general laws of nature, to every being capable of reason."

"I have reflected much on the subject of the poor laws, and hope, therefore, that I shall be excused, in venturing to suggest a mode of their gradual abolition, to which, I confess, that at present I can see no material objection. Of this, indeed, I feel nearly convinced, that, should we ever become sufficiently sensible of the wide-spreading tyranny, dependence, indolence, and unhappiness, which they create, as seriously to make an effort to abolish them, we shall be compelled to adopt the principle, if not the plan,

which I shall mention. It seems impossible to get rid of so extensive a system of support, consistently with humanity, without applying ourselves directly to its vital principle, and endeavouring to counteract that deeply-seated cause, which occasions the rapid growth of all such establishments, and invariably renders them inadequate to their object.

“To this end, I should propose a regulation to be made, declaring, that no child born from any marriage, taking place after the expiration of a year from the date of the law; and no illegitimate child born two years from the same date, should ever be entitled to parish assistance. And to give a more general knowledge of this law, and to enforce it more strongly on the minds of the lower classes of people, the clergyman of each parish should, previously to the solemnization of a marriage, read a short address to the parties, stating the strong obligation on every man to support his own children; the impropriety, and even immorality, of marrying without a fair prospect of being able to do this; the evils which had resulted to the poor themselves, from the attempt which had been made to assist, by public institutions, in a duty which ought to be exclusively appropriated to parents; and the absolute necessity which had at length appeared, of abandoning all such institutions, on account of their producing effects totally opposite to those which were intended.”

“After the public notice which I have proposed had been given, and the system of poor laws had ceased with regard to the rising generation, if any man chose to marry, without a prospect of being able to support a family, he should have the most perfect liberty so to do. Though to marry, in this case, is in my opinion clearly an immoral act, yet it is not one, which society can justly take upon itself to prevent or punish; because the punishment provided for it by the laws of nature, falls directly and most severely upon the individual who commits the act, and, through him, only more remotely and feebly, on the society. When nature will govern and punish for us, it is a very miserable ambition, to wish to snatch the rod from her hands, and draw upon ourselves the odium of executioner. To the punishment, therefore, of nature he should be left, the punishment of severe want. He has erred in the face of a most clear and precise warning, and can have no just reason to complain of any person but himself, when he feels the consequences of his error. All parish assistance should be most rigidly denied him: and if the hand of private charity be stretched forth in his relief, the interests of humanity imperiously require that it should be administered very sparingly. He should be taught to know that the laws of nature, which are the laws of God, had doomed him and his family to starve for disobeying their repeated admonitions; that he had no claim of right

on society for the smallest portion of food, beyond that which his labour would fairly purchase; and that, if he and his family were saved from suffering the utmost extremities of hunger, he would owe it to the pity of some kind benefactor, to whom, therefore, he ought to be bound by the strongest ties of gratitude.

“If this system were pursued, we need be under no apprehensions whatever, that the number of persons in extreme want would be beyond the power and the will of the benevolent to supply. The sphere for the exercise of private charity would, I am confident, be less than it is at present; and the only difficulty would be, to restrain the hand of benevolence from assisting those in distress in so liberal a manner as to encourage indolence and want of foresight in others.”

“With regard to illegitimate children, after the proper notice had been given, they should on no account whatever be allowed to have any claim to parish assistance. If the parents desert their child, they ought to be made answerable for the crime. The infant is, comparatively speaking, of no value to the society, as others will immediately supply its place. Its principal value is on account of its being the object of one of the most delightful passions in human nature—parental affection. But if this value be disregarded, by those who are alone in a capacity to feel it, the society cannot be called upon to put itself in their place; and has no further business in its protection, than in the case of its murder or intentional ill-treatment to follow the general rules in punishing such crimes; which rules, for the interests of morality, it is bound to pursue, whether the object, in the particular instance, be of value to the state or not.”

The remedy then which this profound politician proposes for the existing evils of society in England, is simply to abolish the poor rates, and starve the poor into celibacy. That moral restraint, that chastity which, according to his own argument, is all that is wanting to render possible and permanent the system of equality, he expects and demands now from the poor. The exercise of that virtue, which, as he had reasoned, could only exist in men highly enlightened and highly virtuous, he expects and demands from the ignorant, degraded, brutalized, miserable, poor people of England! If you beget children, he says to them, they must perish for want. No public relief is to be given to the starving infant, society is not to interfere, except that it is to hang the mother, if she shorten the sufferings of her babe by destroying it! This reformer calls for no sacrifice from the rich;

on the contrary, he proposes to relieve them from their parish rates: he recommends nothing to them but that they should harden their hearts. They have found a place at the table of nature; and why should they be disturbed at their feast? It is Mr. Malthus's own metaphor!

"A man who is born into a world already possessed, if he cannot get subsistence from his parents, on whom he has a just demand, and if the society do not want his labour, has no claim of right to the smallest portion of food, and, in fact, has no business to be where he is. At nature's mighty feast there is no vacant cover for him. She tells him to be gone, and will quickly execute her own orders, if he do not work upon the compassion of some of her guests. If these guests get up and make room for him, other intruders immediately appear demanding the same favour. The report of a provision for all that come, fills the hall with numerous claimants. The order and harmony of the feast is disturbed, the plenty that before reigned is changed into scarcity; and the happiness of the guests is destroyed by the spectacle of misery and dependence in every part of the hall, and by the clamorous importunity of those, who are justly enraged at not finding the provision which they had been taught to expect. The guests learn too late their error, in counteracting those strict orders to all intruders, issued by the great mistress of the feast, who, wishing that all her guests should have plenty, and knowing that she could not provide for unlimited numbers, humanely refused to admit fresh comers when her table was already full."

It is easy to see what, upon Mr. Malthus's view of society, would become the perfect system of policy, when the English constitution shall have expired by that atrophy which daily wastes away its vital powers, that slow poison which has been year after year administered. The first step would be to commute the miseries of poverty for the comforts of servitude: for this, the frequent argument that the negro-slaves are happier than the poor people of England, has prepared our legislators; and the poor might be brought to it, as they are to be brought to celibacy,—by starving. It having been found that slaves are more

manageable than servants, the next discovery would be the great fitness of considering them as cattle, for which the whole system of our slave-laws has also prepared us. Having adopted the wisdom of Oriental monarchies, we should then readily adopt the magnificence of Oriental manners; and introduce into England the wise invention of Semiramis for counteracting the principle of population. The advantages are obvious: the people would be happier, because poverty would be annihilated; the fine arts would be improved, inasmuch as we should rear our own opera-singers, and reform our church-music according to Italian taste; and the proceedings of government would be wonderfully facilitated, for John Bull has been at times a refractory animal, but John Ox would certainly be tractable.

What then is the purport of this quarto volume? To teach us, first, that great misery and great vice arise from poverty; and that there must be poverty in its worst shapes, wherever there are more mouths than loaves, and more heads than brains. Secondly, that the only remedy is, that the poor should not be encouraged to breed. There is not a man in England who was ignorant of the first fact, nor a mistress of a family who does not advise her servants not to marry. No wonder that Mr. Malthus should be a fashionable philosopher! He writes advice to the poor for the rich to read; they of course will approve his opinions, and, understanding with perfect facility the whole of his profound reasonings, will of course admit them with perfect satisfaction.

The folly and the wickedness of this book have provoked us into a tone of contemptuous indignation: in affixing these terms to the book, let it not be supposed that any general condemnation of the author is implied, grievously as he has erred in this particular instance.—Mr. Malthus is said to be a man of mild and unoffending manners, patient research, and exemplary conduct. This character he may still maintain; but as a political philosopher, the farthing candle of his fame must stink and go out.

ART. XVIII. *Memorial addressed to the Sovereigns of Europe, and the Atlantic.* By Governor POWNALL. 8vo. pp. 150.

THE leading object of this memorial is to recommend the interference of the British government to bring about the

emancipation and independence of the Spanish settlements in North and South America.

This interference could only be justifiable in case we were at war with Spain : it could only be efficacious, with respect to Mexico, in case we had the secret connivance of the proprietors of Louisiana, through which provinces the supplies of men and arms might most conveniently be forwarded. With the connivance of the present proprietors of Louisiana, all the necessary assistance can with facility be afforded without British interference at all. So that the whole undertaking, practicable and useful as it may appear, is but a freak of supererogatory eleutherism.

Peru can be assisted efficaciously only from Hindostan. It would be amusing to see the ministers of George the third ordering of the king's printer, for the Quito market, a new edition of the *Araucana*, which celebrates the rebellion of Chili ; and a Spanish translation of *Pizarro*, with those passages strengthened, which would found thrones on the choice of the people, and substitute voluntary to innate submission. We apprehend these ministers will hesitate a little before they instruct marquis Wellesley to be tampering with the fidelity of the viceroy of Lima, and endeavouring to conciliate his concurrence in a plan of independence ; before they instruct him to represent that allegiance is the virtue of weakness, that to rescue the commerce of Peru from the oppressive monopoly of the Spanish *gremios* would be conferring a diffusive benefit on the motley nations entrusted to his charge ; and that to save Peru from its present indirect dependence on the swindling ministry of France is in fact to preserve it for those only Spaniards, who have the true temper and honour of Castilians.

For the accomplishment of these rather jacobinical purposes, which would however augment the commercial relations of Great Britain, our author conceives an alliance with the republic of North America to be necessary. We fear this is only to be purchased by our going over to whiggism : the friends of liberty govern in North America, and they entertain a prejudicial dislike of the party in power here. Their opposition to our interests is a natural consequence of our toriyism, and will be coeval with it. It is right, however, to hear our author.

“ There is nothing which would more strongly cement this alliance between these

two Atlantic powers, than their joining ~~as~~ in a common cause, in co-operation, to emancipate the inhabitants of the Spanish provinces in South America from the provincial external government by which they are oppressed, and to which that portion of mankind are subjugated ; and in laying open the abundantly rich commerce of those regions to the free intercourse of all the world, and in releasing it from the bondage of monopoly by which it is now fettered down ; and in clearing a channel for those riches which now come to Europe in barren exclusive revenue, that such may flow to all mankind in the fecundating streams of commerce. The joint operations of those two Atlantic powers, in actuating this commerce, will create a new Atlantic common interest, by raising into freedom and independence an Atlantic state ; and that state must, from its own nature, and from the relations which it holds to these its deliverers and defenders, become an active party in, and give additional strength to, the great marine Atlantic alliance.

“ As this union of alliance will be quite a new thing in the world, and exist under entirely new circumstances, there ought to be formed a new act of navigation, common and reciprocal to all these parties, deriving its authority as law from special treaty between each of these parties, or by general convention of all.

“ These suggestions lead the memorialist to the consideration of the measure itself.

“ The inhabitants of South America are divided into kingdoms and states, on the foundation of old dominions. The original natives, and those Spaniards who have become incorporated with them, have long formed a preponderating interest, and have now at length arisen to an ascendant interest in those communities ; they are at the crisis of an explosion to independency, which the government of Old Spain hath not the power to prevent or to resist. This revolution is now nascent.

— omnia tempus

Nacta suum, properant nasci —

It will not be withheld. The consideration, whether it shall so arise or not, is no longer a question. The progress by which these states were advancing to this crisis of independency, the nature of the polity on which they were founded, and which gave course to this progress, were, in the year 1780, explained by the writer of this, in a memorial at that time published as addressed to the Sovereigns of Europe.—‘ South America is not yet, in its natural course, ripe for falling off ; nor is it likely, from the slow, official, cautious prudence of its metropolis, to be forced before its time and season to a premature revolt, as North America has been. As long as the Spanish government proceeds in administering the affairs of its American es-

establishments with the temper, address, and wisdom which she observes at present, an indolent, luxurious, superstitious people, not much (though much more than the world suspects) accustomed to reason on political arrangements, will continue in a certain degree of subjection to government, and in a certain degree of acquiescence to commercial restrictive regulations, in their European course, for the sake of reciprocity of enjoyment and protection which they derive from it. Not yet being hardened into a temper for enterprise by force of war, they will continue to pay their taxes as a peace-offering. The natives, however, encreasing in numbers, beyond any number of old Spaniards which the metropolis can send either as civil governors and magistrates, or as soldiers; having the interior executive power of all the inferior magistracies in their own hands, by their own election of the magistrates; and having invariably, where their choice operates, made a decided rule to choose those of

their own body, they have, so far as that goes, all the power of internal government in their own hands, in which the majesty of the sovereign state never interferes: and whatever sovereignty the Spanish monarch holds by the offices of his viceroys, of his judges, of his audiences, his clergy, or his army; however majestic they may look, or however it may appear to individuals, and, in particular exertions, to carry terror, it is a mere tenure at good-will."

The author proceeds to explain in detail his plans of proceeding, which are based on much local knowledge and enquiry concerning the country.

The whole memorial contains many interesting and instructive passages, but they are expressed with a mystical and tumid frothiness, less likely to secure the praise of eloquence than to endanger that of thinking clearly.

**ART. XIX.** *An Historical and Political View of the Disorganization of Europe, wherein the Laws and Characters of Nations and the Maritime and Commercial System of Great Britain and other States are vindicated against the Imputations and revolutionary Proposals of M. Talleyrand and M. Hauterive, Secretaries of State to the French Republic.* By T. B. CLARKE, LL. D. 8vo. pp. 208.

GREAT Britain has two main purposes to pursue in her continental politics. Firstly, to subdivide the continent into the greatest possible number of important states; because her own magnitude being limited by nature, her relative importance depends on the other nations not attaining a more than equipollent magnitude. Secondly, to balance against each other the habitual constellations of states, so that her own accession to either confederacy may prove decisive, and secure an attention to her interests in the eventual distributions of disputed territory. These interests are nearly confined to a limitation of the northern aggrandisement of France, which can most effectually be accomplished by adding Holland, Westphalia, and all the territory between the Rhine and the Elbe to the Prussian dominions. This territory would then be protected by a sufficient force against French usurpation. In 1787, the opportunity existed so to allot these provinces; but it existed in vain for the puny statesmanship of the then minister. It remains for intellect to recover the opportunity. An alliance with Russia and Prussia against the preponderance of France, would probably restore it. Now that Austria has lost the Netherlands, Great Britain has no remaining interest in her power, or her success.

Whatever of opinion, of expence, of commercial accommodation, of territorial sacrifice (there are remnants of Dutch colonies, which Prussia might be induced to covet) would purchase the entire friendship of Berlin, should be applied to conciliate that friendship. The possession of the whole coast from the Rhine to the Weichsel, including the very probable absorption of Denmark, will still not aggrandize Prussia into a rival maritime power. It is useless now to lament the folly and perverse misconduct of the Antijacobin war; we ought to bend our undivided energies to undo the resulting mischief.

This book is too much occupied with the remote past. Let Talleyrand abuse our press, provided we retain its freedom. Let Hauterive point out our ancient insignificance, provided we avoid to smooth the way for its return. All countries are ambitious, and ought to be so. It is the preserving principle of national strength; and, like the desire of bettering one's condition in private life, prevents the unwholesome indolence of contented decrepitude. France is enormously aggrandized and strengthened. It is for Great Britain to aggrandize and strengthen herself also; by the occupation of such colonizable territory as will best contribute to increase her commerce and resident wealth;

and by the dissolution of those monopolies which resist the dispersion of her opulence over the whole surface of her territory.

Dr. Clarke's third chapter is properly managed. It tends to sow jealousy between France and Prussia, by bringing out the illiberal sarcasms cast by Hauterive on Prussian policy. We transcribe.

"The second cause of the disorganization of Europe appears, according to Mr. Hauterive, on the part of Prussia.

"This gentleman says, it is not for him to trace by what means the successor of a prince rose, who acted a subordinate in the treaty of Westphalia; who wrote in terms of respectful distance, to the ministers of one of the principal powers, and from whom those ministers withheld the title of highness in their letters. But to the elevation of this house of Brandenburg is owing a considerable share of the disorganization of Europe. The treaty of Westphalia had for its objects the reconciliation of the protestant and catholic interests. France declared herself the protector of the rights of the protestants. But the rise of Prussia in the empire changed the motives of regard previously entertained for the necessary guardianship of France. Prussia had its own interests in view, sometimes foreign, sometimes opposed to the interests of the German confederacy. Hence Prussia by its rise rendered appeals to France for its intervention between the head of the empire and its members, in cases of rupture, less frequent. Hence Prussia by its rise caused disputes between the empire and its members to be more frequently the occasions of war. Hence Prussia by its rise rendered France almost a stranger to the interests of Germany, and Germany to the interests of France. Hence Prussia by its rise causing disputes on the constitution of the empire to be no longer determined by France, they were resolved by violence, and by the pleasure of the strongest. Hence Prussia by its greatness made the protestant confederacy to disappear, even to the name which indicated a community of rights and interests; and usurping the place of France by its protection, identified the confederacy with itself, under the title of the Prussian party. Prussia however did not and could not acquire territorial resources proportionate to its ambition. Prussia did not found its rise upon conquest: this would have unmasked the designs of aggrandisement. Prussia dissembled its ambitious plans under the plausible forms of the improvement of tactics and its system of finance; and thus rousing emulation rather than fear, the consequences have been fatal. Taught by Prussia, princes have adopted the opinion, that gold circulates in their countries only to enrich the treasury, and that nature has produced men only to be-

come soldiers. But in the hands of most ministers, the former has proved the chimera of the Danaides, whereas the latter was a ruinous reality. And hence Prussia by its rise, by its systems, and by the influence of these systems, bowed down every state of Europe—weakened the springs of government—rendered intolerable to every people the yoke of the authority that galled them—multiplied the pretexts for hostility—disposed princes to seek every occasion of war—furnished the means of rendering wars more general, more lasting, and more bloody—and finally aggravated the political disorganization, of which the war of the revolution is the last, and one of the most important effects.

"Thus Prussia stands arraigned before the great tribunal of the world, as guilty of the disorganization of Europe. Such is the substance of this charge; of which the two predominant features are, 1st. Prussia, dissembling her plans of ambition under plausible forms, first taught to princes, that nature only furnished men to be formed into soldiers, by the example of her military system; and 2d. Gold circulated in their countries only to enrich their treasuries by the example of her financial system. Let us now examine on what grounds these accusations stand. For, on these two points as causes, in like manner as on the exemplary lust of conquest imputed to Russia, all the subsidiary reasoning, and detailed assertions of Mr. Hauterive are built. But we shall soon find that all this gentleman's causes and consequences, have neither cement, foundation, nor existence whatever, save in misconception, or in extreme historical and diplomatic misinformation.

"During the sixteenth and seventeenth centuries, Europe was alternately menaced with a great revolution and an universal monarchy, by the houses of Austria and Bourbon. The vast possessions, and preponderant power of these monarchs urged them on to enterprises ambitious and unjust. Chiefly Lewis XIV. by his standing and numerous armies, menaced the rights of his neighbours whose military power was but moderate.

"This ambitious monarch was the founder of the military system, according to Voltaire, and was the first who established numerous armies. He instituted grenadiers; introduced the use of the bayonet; augmented dragoon cavalry; settled the manner in which the artillery was served; founded academies for the artillery; formed immense magazines of military stores; raised regiments of bombardiers; established regiments of militia at the expense of the communities; maintained and instructed companies of cadets in most of the frontier towns; formed corps of engineers; perfected the art of fortification under Vauban; constructed, repaired, and formed one hundred and fifty fortifications which were rendered almost impreg-

nable; appointed inspectors general, and afterwards directors, for the strict maintenance of military discipline; instituted military honours, which are more desired than pecuniary rewards; and to crown his military system and his endeavours to be well served, he instituted the hospital for invalids.

"Thus his armies became through the arrangements of this great military system, the astonishment of all and the terror of many of the nations of Europe! Such numerous troops had never before been seen. He kept in pay, says Voltaire, 450,000 men. From the time of Mazarine's death to that of his own, he was engaged in a course of wars, which lasted nearly thirty years. His navy consisted of 780 ships, of which there were 110 of the line. But by the good policy and valor of Britain, Sweden, and Prussia, the balance of power was, notwithstanding, preserved from annihilation. In order to meet the magnitude of the danger, and to guard against meditated surprise, Prussia beheld at once her sole security, and the true basis of peace in the strength of her armies. Hence therefore the remedy was proportioned to the evil; but the necessity of this conduct was forced upon her from the quarter where the example originated. The system had been even perfected in France before it had been thought of in Prussia. So vast, so complete was the military system of Lewis, that Voltaire says, the troops of all his enemies were not so numerous; they certainly were not so strongly united, and thus he had always great successes or great resources. The genius of the sovereign of Prussia, did not content itself however with forming a vast military machine; he contemplated and he discovered the modes of making it act with new energy in war and advantage in peace. His improvement in tactics followed, of which his enemies can tell the effect. The burden, which results from the support of armies, he made these armies compensate by their utility, not merely with respect to the repulsion of external danger, or the support of internal security. But his army, which was not disproportioned to his ordinary revenues, for his treasures accumulated by an annual surplus, was divided in the provinces, and not in the towns, or on the frontiers. His great object was to render this army truly national, and thereby invincible, and without interfering with rural cultivation. He sent them therefore to their relations, and to their homes, to devote themselves to agriculture during ten or eleven months of the year. Thus his army employed between the sword and the ploughshare, became soldiers renowned in war, and agriculturists useful in peace, and did not prove burthensome to the country.

"Mr. Hauterive, therefore, has fallen into more than one great error on this head. First, Prussia did not set the example of the military system and its numerous standing armies: it was France. And, next, in

France, it certainly proved an evil of the most mischievous magnitude. Whereas in Prussia it proved a good of the first importance, not solely with respect to Prussia itself, but to Germany and Europe. For under the military system divested of its poison by the sagacity of the monarch, the Prussian nation has grown and prospered, and has not declined into disorganization and revolution. Mr. Hauterive, however, asserts that this greatness of Prussia became pernicious to Germany and to Europe; and that by its influence and example it created wars in the one, and disorganization in the other. History informs us, on the contrary, that from the period of the establishment of Prussian greatness to the present one, it did not create wars in the empire; for there have been no wars amongst the princes, as Mr. Hauterive affirms. And it is the growth and preponderance of Prussia which prevented these wars. They must have infallibly arisen out of the internal dissensions of the empire, had it not been for the intervention of this power.

"Let us now examine how far this gentleman is likewise erroneous, when he asserts that Prussia first taught to the princes of Europe that gold circulated in their countries only to enrich their treasury. The historical panegyrist of Lewis XIV. informs us, that when this monarch lay on the bed of death and held his successor in his arms, he uttered these remarkable words to him, which could have proceeded but from his revolving within himself all his military and financial operations: 'I have been too fond of war—imitate me not in that—no more than in my too great expences.' He, to whom they were uttered, preserved them in writing at the head of his bed. But let Mr. Hauterive direct his researches a little further, and he will perceive the history of France informing him that the system of finance, which gave in France such a pernicious facility to answer any sudden demand for war, was introduced by Catherine de Medicis, abolished under Henry IV. revived under Lewis XIII. and so fatally enfeebled the latter times of Lewis XIV. that about the years 1691 and 1692 the finances were in extreme disorder. And on this occasion the historian observes, 'it is only war that impoverishes a state.' Since the time of the ancient Romans, I know of no nation that has enriched itself by its victories. Italy in the sixteenth century, owed its wealth entirely to its commerce. Holland would have subsisted but a very short time, had it looked no farther than the seizure of the Spanish plate fleets. The Algerines, who support themselves by their piracies, are a very wretched people. Among the European nations, war, after a certain term of years, reduces the conqueror to the same distress with the conquered."

A better defence of the maritime system.  
X

tem might have been drawn up than is contained in the fourth chapter. Compare the acknowledged laws of maritime armaments with the acknowledged laws of territorial armaments; and it will be found that moderation has been a distinguishing virtue of the framers of the maritime code. The Frederics or Bonapartes have not shewn such respect for the rights of neutrals, as the admirals of Britain; yet further derelictions of claim would still be expedient. The northern popularity of Great Britain is not consulted by any of those arrogant claims, which our pretenders to statesmanship seek a low applause by asserting. A minister of talent would choose to renounce them all, conscious that the claim is a barrier to friendship; and that all such claims amount, at the moment of practical enforcement, to nothing at all. The right of strength and the right of wit will ever be used in an emergency: contraband of war will always be seized by the powerful, and always furnished by the dextrous, during a blockade. The agreements do, indeed, guide the decisions of courts of justice, concerning the legality of prizes; but who would wish not to predispose our courts of admiralty to consult the interests of foreigners as well as of natives? because equity is most favourable to an increase of commercial intercourse.

In the concluding chapter a violent effort is made to demonstrate the great increase of our prosperity. We are told that the coinage from the Revolution to the death of George II. amounted to 33,000,000*l.*; but that it has amounted under George III. to nearly double the sum, namely, 62,000,000*l.* This is

quoted as a proof of increased wealth: it only proves that bullion of late years has often been worth more than coin; and that a great deal has occasionally been melted down for exportation. The increased rental of the country is also adduced; but if the pound sterling has diminished in value, this proves little. New inclosures are vauntingly said to have taken place; they always abound during a cycle of dearth; and during the first cycle of cheapness, half of them will probably be abandoned again to sheep-walks. It is not at all desirable to wind up rents very high; or to cultivate every acre of the country: corn should be grown where it can be grown cheapest, in North America, and in such countries as have no rents to pay. By attempting to force the growth of corn here, we render a vast portion of our prosperity dependent on the dearth of food, which is always a public misfortune. In order to prevent the land-owners from losing their rents, our houses of parliament, which consist of land-owners, grant one another, by law, a monopoly of the home-market, and prohibit, at certain prices, the importation of corn; thus taxing the whole community, to accommodate themselves with unnecessary rent. The result of our author's sanguine estimate is, that every man, woman, and child is worth, on the average, two hundred pounds; that eighty millions is the yearly value of their industry; and two thousand millions the value of the whole British nation. Lucian turns auctioneer to the philosophical sects; our author to the European nations; but his Britain is above the bidding even of a Didius Julianus.

ART. XX. *A Summary Account of Leibnitz's Memoir addressed to Louis XIV., recommending to that Monarch the Conquest of Egypt, as conducive to the establishing a supreme Authority over the Governments of Europe.* Svo. pp. 104.

DURING the infancy of agriculture Egypt was an important country.—Lands, which could be brought into cultivation without manure, or the spade, or the plough, might well astonish early society by their fertility and produce. But now that the art of husbandry is improved, and the conquests of tillage immeasurably extended, the strip of ooze between the granite mountains of Egypt is scarcely important to the corn-merchants of Europe. The Delta, it is true, has larger dimensions than ever; but

the perpetual addition of alluvion-soil has lifted much of it above the reach of regular inundation. So that the sum of arable surface is probably not greater than of old. What does Egypt produce beside corn and natron, which promises to commerce any sensible accession? The productions of tropical agriculture might indeed be naturalized there; but it would be a speedier process to raise them on the Zaire, the Coanza, the Orange-river, or on the Oronoko, by means of creole coloniza-

tion, than to undertake the discipline of the present Egyptians into such planters as the West-Indians. It is, therefore, not worth while to covet or envy this acquisition: it would rather be a glorious than a useful prize. Only inasmuch as Egypt is the best road to the interior of Africa, could it be worth the while of the British nation to occupy it; but the river-Zaire is probably its best road. It has been said that Egypt is a stepping stone from Europe to Hindostan: yet it has constantly been neglected, since the establishment of a ferry by the Cape of Good Hope. Where has it a port in the Red Sea? Where has the Red Sea forests of ship timber? And if a naval station were to be occupied in the Isle of France, or Bourbon, or Madagascar, how should any Red Sea fleets escape squadrons stationed there? It would be wise then to let the French over-run Egypt; if for that they would evacuate the European Holland.

Nor is it very clear that the memoir of Leibnitz, of which a neat and interesting analysis is here given to the public, was not drawn up with this very view. In order to divert Louis XIV. from the conquest of protestant Holland, the pious Leibnitz suggested to his ambition an attack on infidel Egypt. It was likely to prove a perpetual drain of men and treasure; for it had always been the grave of its conquerors. Cambyses lost there the empire of Persia; Perdicas, the empire of Macedon; Pompey and Anthony, the empire of the world. The conquest of Egypt under Omar gave occasion to the partition, and that under Saladin to the dissolution of the califate. With the reign of Selim, the acquirer of Egypt, begins the declension of Turkish power. The judgment of Leibnitz cannot possibly have credited the Arabian tales of Egyptian opulence and populousness; yet he describes it with all the enthusiasm of Amrou's exultation, *oculus regionum, mater frugum, sedes commerciorum*. He mixes up with his panegyric all those vain-glorious motives of conduct, which were likely to operate on the sympathetic vanity of Louis XIV. and of his subjects. He offers to the monarch, whom he would seduce, the titles of emperor of the east, advocate of the church, and arbiter of the universe. He describes the Egyptians as seditious, which is true; as likely to side with the Christians,

which is very questionable; as easily retained when once conquered, which is notoriously erroneous; and as defended by an insignificant force of janissaries and mamelukes, which is a somewhat treacherous misrepresentation. If this memoir, as is likely enough, really influences the proceedings of the modern French, let it spur them on; let them follow their ninth Louis to Damietta, and win new victories at Massour; pestilence will again blast the palms of victory.

There is surely a sensible tincture of irony in the following passage:

"A war with Christian states can only lead to the acquirement of small accessions of territory; a tedious process for those who aspire after great things. And experience proves, that every increase of power proportionally encreases suspicions and confederacies. Hence, a prince, aiming, like the most Christian king, at great achievements, will be cautioned by his wisdom to abstain as much as possible from seeking his aggrandisement by these means. For, to proceed in that course would be at once to prescribe the "*non plus ultra*" of his progress; and, for a trifling consideration at hand, to part with the greatest and the best founded hopes.

"Such objects are to be far more easily and certainly acquired by elections and successions, and that which gives origin to all successions, matrimonial alliances. It was thus the house of Austria grew in power, and thus the house of Bourbon will likewise grow, if it persists in the course in which it began. Since, therefore, there are these three methods of aggrandisement—war, elections, and successions; and since the stability of the monarchy, and the internal happiness of the people, are best consulted and promoted by cultivating the several arts and relations of peace with our neighbours in Europe, it follows, that war ought to be exclusively employed against the barbarous nations.—And, among these, it is incontestible, that by one fortunate blow (for striking which the French are most peculiarly formed by nature) whole empires may be at once both subverted and founded. There indeed will be found the materials for supreme power, and glory incredible; by which the most Christian king will find himself exalted to the authority of general or chief of Christendom, and France become the military school of Europe, the academy for the confluence of the most distinguished talents, and the emporium at once of the ocean and of the Mediterranean Sea. And if honour, and indisputable right to high prerogative be sought for, the titles and rights of emperor of the east, recovered from the violation of the Turks by the exertions of the French (who,

formerly, under the Baldwins, held that empire for a time at Constantinople) would be thus acquired, together with the power of universal arbitration; an object far more valuable in the estimation of the wise than universal monarchy itself."

This is further corroborated by those lines in the epistle of Leibnitz to Mons. de Scuderi, written in November, 1697, in which the philosopher thus mentions the monarch.

Les héros, tels que lui, sont de tous les pays ;

Où leur nom peut aller, ils ont les coeurs soumis.

Cette monarchie est la seule universelle,  
Et de celle de Dieu le plus juste modele.  
Et Louis étant tel, l'aurait été toujours,  
Sans le destin fatal au repos de nos jours.  
O nécessaire mal, politique facheuse,

Vos soupçons ont rendu l'Europe malheureuse :

Plus Louis est le Grand, plus chacun allarmé  
Avance, en repoussant, le désastre éloigné.

Indeed all the connexions of Leibnitz favour the suspicion, that he was no cordial friend to French aggrandizement, but was very willing to owe to French enquiry the information he coveted about the supposed resemblance of the Armenian and the Egyptian dialect, and the possibility of explaining in Coptic the names of the Roman divinities. In the

letter to the Abbé de Saint Pierre, on the project of a perpetual peace, he says the best way to realize it would be to assist the emperor in driving the Turks out of Europe, which is a glaring *persiflage*. It is, therefore, not at all improbable that his archness, like that of Socrates, often passed for earnest; and eluded suspicion by its apparent heterogeneity to his character.

Instead of viewing the project of Leibnitz as a philosophic fence, exhaling in order to infatuate and mislead, and dazzle and bemire the French nation, this editor seems to consider it neither as an ironical, nor as an unsound project. He chooses for his motto the line of Lucan,

*Ægyptum certe Latius tueamur ab armis !*

and would have this country take the idle trouble of ridding the Copts of their new mamelukes. Let us, on the contrary, open toward the south side the barrier-gates of Europe; and, if possible, induce France to pursue her aggrandizement in any other direction rather than along the northern coast. By the possession of Holland, the security and independence of Great-Britain is far more seriously threatened than it would be by the annexation of the whole Roman empire besides to France.

ART. XXI. *The French considered as a Military Nation, since the Commencement of their Revolution; exhibiting by their Conduct towards Europe in general, a serious Warning to Great-Britain: with a proposed Plan to Hut the Troops, &c.* Svo. pp. 72.

THESE patriotic pages are addressed to the navy, army, and volunteers of the United Kingdom: they are penned by some one well acquainted with what may be called the generic character of a French soldier. Their avowed object is, to shew to the British army and the English people at large, what French soldiers really are, how they have been commanded, and by what extraordinary means they have been rendered subservient to every project of ambition. The courage and bravery of the French are not underrated, but it is truly remarked that much of their success may be ascribed to other causes than ascendancy in valour, or superiority in military skill. They, as well as their enemies, have often committed the grossest blunders, but the latter were not always so ready to profit by them.

It is stated here, that the revolution

"has destroyed the science of artillery, or engineering, in France." The French are a military nation, and every thing connected with tactics is a subject of importance to them. To their flying artillery, composed of the best and bravest of their soldiers, the French are avowedly indebted for the majority of their victories. If it is true that the revolution disorganized the military, as well as every other branch of the government, there is yet every presumption that they will now use the ancient tactics as the basis of a modern superstructure. The *Dépôt de la Guerre* is at this time under the direction of that accomplished general, Andreossy: it is an establishment likely to be attended with incalculable advantages to the enemy, and which cannot too strongly be recommended as a model for imitation to the British government. *Fas est et ab hoste doceri.* This

Dépôt,\* or repository of maps and plans of war, &c. &c. was established by Louvois in 1688: archives were collected, memoirs, the correspondence of generals, and accounts of military transactions were arranged in order. The importance of the establishment was soon perceived: the materials were increased and more methodically arranged, by Marshal de Maillebois, who was appointed director in 1730. The most important improvement was made by M. de Choiseul, who established a corps of geographical engineers, and charged this dépôt with the direction of their labours. Lieutenant-general De Vault simplified the numerous documents, by retrenching from the military correspondences and memoirs whatever was superfluous, and classing the remainder chronologically under the head of a different army or operation. In this manner he arranged all the military events from the German war, in 1677, to the peace of 1763: this analysis forms 125 volumes, each of which is preceded by a very succinct historical summary of what is more fully detailed in the body of it. This establishment survived the revolution.—When France was at war with all Europe, the advantages which she derived from this collection of the military and topographical labours of the monarchy, from the body of information which it contained respecting the resources and the country of the hostile powers were so great, that it was thought necessary to give the institution a new organization. At the time when individual sacrifices were proudly laid upon the altar of patriotism, private cabinets gave up their scarcest maps to government; the suppression of monasteries and abbeys called to light those geographical treasures which had lain buried in obscurity; intelligent officers were placed in the dépôt, and no less than thirty-eight persons were employed in drawing plans of campaigns, sieges, &c.; mathematicians and astronomers were attached to the institution, and dispatched to different places; and the dépôt now contains one of the first collections in Europe of geographical works. It forms various sections of geographers, who are at present employed in constructing accurate maps of the four united departments,

Piedmont, Savoy, Helvetia, and the part of Italy comprised between the Adige and the Adda. One section, in conjunction with the Bavarian engineers, is constructing a topographical map of Bavaria; another is carrying into execution the military surveys, &c. ordered by general Moreau for the construction of a map of Suabia. It has just published an excellent map of the Tyrol, and resumed the continuation of the superb map of the environs of Versailles. Since the year 1795, it has formed a library composed of upwards of 8000 volumes or MSS. the most rare, as well as the most esteemed, respecting every branch of the military art. General Andreossi is now on the point of publishing a periodical work to be entitled "*Mémorial du Dépôt de la Guerre*," the object of which is to unite the exposition of the knowledge necessary for the direction of the dépôt for geographical engineers, staff-officers, military men in general, and for historians. The author of "*Paris as it was, &c.*" concludes his letter thus: "In order to give you at one view a complete idea of the collections of the Dépôt de la Guerre, and what they have furnished during the war for the service of the government and of the armies, I shall end my letter by stating, that independently of 8000 chosen volumes, among which is a valuable collection of Atlases, of 2700 volumes of old archives, and of upwards of 900 cartons or pasteboard boxes of modern original documents, the dépôt possesses 131 volumes, and 78 cartons of descriptive memoirs (composed at least of 50 memoirs each), 4700 engraved maps, of each of which there are from two to twenty-five copies, exclusively of those printed at the dépôt, and upwards of 7400 valuable manuscript maps, plans, or drawings, of marches, battles, sieges, &c. By order of the government it has furnished, in the course of the war, 7278 engraved maps, 207 manuscript maps or plans, 61 atlases of various parts of the globe, and upwards of 600 descriptive memoirs."

Are the French likely to forget the science of engineering? What is Great-Britain about that she does not rival her enemy in establishments of such national importance?

\* For a more ample account of this institution, see "*Paris as it was and as it is*:" we are consulting the first volume for these particulars.

ART. XXII. *Sketches of the intrinsic Strength, Military and Naval Force of France and Russia; with Remarks on their present Connexion, Political Influence, and future Projects.* In Two Parts. Part I. Quarto, pp. 220.

A WISE general will rather give his enemy credit for greater strength and ampler resources than he actually possesses, than despise the one and under-rate the other; many a battle has been lost by the perviousness of an imaginary panoply. It would have been no more than prudent, perhaps, to have employed the short interval of peace which was allowed us, in examining carefully and minutely the situation of our ancient foe: it would have been well to have estimated the injury he had received from blows in the contest, but at the same time to have ascertained, whether his limbs had not grown stronger by long athletic exercise. Goaded by the silly and insulting threat that we dare not engage him single-handed, in the confidence of our prowess we accepted his challenge, and the issue of the conflict is now in the hands of him "who is the only giver of all victory."

It was the ruinous system of the Pitt administration to gain popularity for the war by inducing hopes which were never likely to be realized, and which therefore ended in the bitterest disappointment; the French government was at one time stated to be on the brink, nay in the very gulph of bankruptcy, her desperate struggles were the convulsive agonies of death, and the name even of the country was soon to be blotted out from the map of Europe. How contemptible, to say the least of them, are such illusory predictions! But it is to be hoped that we are now profiting by our past folly, and we are not a little indebted to the author of these Sketches for a more just, and therefore a more useful appreciation of the intrinsic strength, the military and the naval force of France. They are only sketches, but they come from the hand of a master—the line which a stranger drew on the canvas of Protogenes was immediately detected by the Rhodian painter to come from the hand of Apelles.

This work is printed at the Hague, but the author dates from Paris; and when he controverts the assertions, either ignorant or treacherous, of those British writers, who would lull us into fatal security by setting forth the misery and oppression which they pretend invade the interior of France, his state-

ments are entitled to confidence, from the pledged assurance that he speaks "from ocular evidence, having within these twenty months visited every department of that vast republic."

"As matters now stand, the political powers and military force of continental Europe are to be considered, as concentrated in the governments of France and Russia. These two states have, each in its sphere, fought themselves over the frontiers of resistance; in understanding with one another, no power, or combination of powers can check, or interrupt the operations of either of them. South of the Danube and the Elbe Europe is directly and indirectly subject to France; and the coasts of Barbary and Morocco will forthwith be colonized under her authority. North of the Elbe and Danube to the Frozen ocean is under the dominion and immediate control of Russia; Asiatic Turkey and Persia may also soon fall under her yoke. If Austria and Prussia assume a sort of independence of one another, that very assumption secures the dependency of both, upon the Czar and the Consul: no doubt it will therefore be allowed, and encouraged, until both these governments can be dispensed with. How long the chiefs of those two mighty empires may agree, and continue to pursue their present system, cannot perhaps at this moment be determined; we shall therefore, in as far as relates to their neighbourhood, political ties and commercial intercourse with Great Britain, consider both France and Russia in their present state, and as they now stand relatively to the British empire.

#### "FRANCE.

"No matter who commands there, nor what denomination the government may assume; it is a nation possessing immense natural sources of wealth, power, and political influence.

"Situated as France is, under an excellent climate, and with an arable, easily worked soil, agriculture must always be the staple branch of her national industry, and the principal source from which she must draw her political influence and military power.

"Prior to the revolution, agriculture in France was nearly in the same state in which we find it still in every country in continental Europe: about two-fifths of the land susceptible of cultivation, were, in what is termed culture and pasturage; and produced, upon an average, about one-third of what ordinary culture, upon the like quantity of the same soil, would have produced. Notwithstanding that wretched economy, the government drew, from the produce of agriculture alone, 8,000,000*l.* sterling. The clergy, with religious and charitable institutions, drew

from the same source upwards of 8,000,000*l.* sterling. The feudal and honorary dues paid to the nobility, with corvees, militia, &c. amounted at least to 5,000,000*l.* So that exclusive of the rents of the land paid to the lay-proprietors, and of the duties of excise, consumption, and the like, the produce of the soil was charged annually with upwards of 21,000,000*l.* sterling. By the realization of the church and crown domains, of the tithes, feudal and honorary dues, and, by the abolition of the religious orders, charitable institutions and corvees, the whole of this sum may now be appropriated to a part of the public revenue.

“In every country in Europe, and especially in France, agriculture is susceptible of great melioration; the entire abolition of privileges, and the almost total subversion of property, has laid open an immense field for speculation, which the vigour of the present government seems not ill calculated to encourage.”

Supposing that agriculture in France is still left to individual enterprise, it appears from a calculation, the particulars of which seem very fairly estimated, that in the space of a few years peace France may draw a secure, permanent, and growing revenue of thirty millions sterling, and upwards, from the soil of the territory of the republic! and that not only without adding to the former burdens of the cultivation, or creating any new inconvenience to the public, but even after reducing their taxes by two-sevenths of what was paid under the old system.

Under the monarchy it has been stated, that the rental and raw produce of the soil was charged with about twenty-one, say twenty millions sterling; upwards of 300,000 men were employed in collecting the revenue. If to the loss of their labour, the expence of their maintenance, their extortions, douceurs, &c. estimated at fifteen millions; if to these are added the anticipations upon the revenue, or advances made to government by the farmer-generals, &c. gratuities to the financiers, and spies and informers, estimated at five millions, we have twenty millions sterling, four fifths of which, or sixteen millions, fell upon the proprietors, cultivators, and consumers of the produce of agriculture. The excise and consumption duties on the produce of agriculture, raised at the barriers of the several divisions of the kingdom, were about six millions; so that the rental and produce of the territories of old France were charged with forty-two millions sterling; or with two-fifths more

annually than thirty millions would be upon the present extent and population of the republic.

On this statement we have the following remarks, which are worthy of attention.

“An immense sum: and it proved that the natural resources of that country, well managed, were inexhaustible. Yet the paltry deficit of twenty-two millions of French livres, made the sottish ministry lose the kingdom and their sovereign.”

“Towards the latter period of the monarchy, it was impossible to establish any reasonable system of finance in France. The government having dwindled into the hands of mean intriguing men of narrow conceptions; independence, candour, and honesty, had left the court. The old nobility, and men of property and public spirit, despised an administration which, in common decency, they could not respect; and as a consequence they opposed its measures, whether good or bad.

“When a timid administration arms itself with prejudice and calls jealousy to its aid, it is remarkable how its leaders can resist the powers of common sense. The destruction of the French monarchy, and the means to prevent its fall, were, for the space of fifty years at least, hung up in the cabinet of Versailles, as clear as noon day. In France the whole system of taxation was vexatious, partial, and oppressive; and the punishments of frauds committed on the revenue were tyrannical. The evading an oppressive tax conveys to the mind no idea of moral guilt; and where there is no conviction of guilt, correction or punishment is naturally considered as the most insupportable tyranny. Thus it was the excise laws of the ministry and not the harangues of the philosophers that brought forth in France that terrible doctrine of sacred resistance.”

Speaking of the probable improvement of the state of agriculture in France we are surprised to find our author so decidedly hostile to the exportation of corn, than which he says no measure can be more detrimental to the improvement and prosperity of a nation. A farmer who sells fodder, and a state that exports corn, says he, improve by the same negative progression. This is the revival of an exploded doctrine; and if any new argument had occurred in defence of it, it ought to have been mentioned. A farmer who grows more fodder than he wants for consumption himself, does right to sell it to his neighbour who grows less: it is a system of reciprocal accommodation, and appears to be advantageous, whether adopted by individuals or communities. Agriculture, it is acknow-

ledged, must ever be deemed the staple branch of the national industry of France; but without an unlimited, or at least an indefinite market for the commodity, will France ever be tempted to grow an unlimited or an indefinite quantity? She must copy the villainous policy of the Dutch, who will destroy one-half of the produce of a spice island for the purpose of raising the price of the other half. Is she to hoard her corn year over year in public granaries, exposed to the depredations of vermin, the risk of fire, &c. not to mention the immense loss of capital lying dead? In a year of scarcity what resource has she? But the question is foreign to the present subject, and we shall not discuss it here.

As to the *manufactures* of France, the republic has decided advantages over the monarchy, for the revolution has destroyed that baneful prejudice which excluded manufacturers, mechanics, and merchants, from what was considered as genteel society; it has annihilated the public debt, and the circulating capital is chiefly in specie and wares, labour is low, and the other states of continental Europe can set no manufactures in competition with those of France. "In Great Britain the immense mass of public and private paper in circulation, the amount and manner of levying the public imposts, with the unpardonable\* *neglect of agriculture*, and of the fisheries, have raised the price of labour to such a rate, that notwithstanding the superiority of British mechanism, if efficacious measures are not taken to secure the necessities of common life at a fair price, her exportation must sooner or later be confined to such articles as cannot be made elsewhere."

It is observed, that in order to carry on her *fisheries* with advantage, and the *maritime trade* with security, the republic must establish a durable peace upon solid terms, or must assume a superiority upon the ocean. For our part, we have no hope of the one and no fear of the other. The speculations concerning the maritime trade of France, and the number of seamen she would be able to rear, educate, and employ in the fisheries, have been so much deranged by the renewal of the war, that it would be irrelevant to notice them. The neglect of America during her warfare with France to have secured St. Domingo is reprobated as an irretrievable blunder; some remarks occur on this subject which may be of service at a future period.

"The acquisition of St. Domingo would have been, both in a commercial and political consideration, every thing that America could rationally desire: it would have enabled the United States to carry on a wide, extensive, and profitable maritime trade; and, as it would have rendered the political and mercantile interests of America and Great Britain reciprocal and mutual, by securing the British possessions in the West Indies, it would have raised an insuperable barrier between the United States and their perfidious sister, the French Republic.†

"St. Domingo lost, the Americans have turned their views towards the island of Cuba; they consider the acquisition of that settlement as the certain result of a quarrel with Spain, and they pretend to have already a plausible pretext to make a claim upon that forlorn monarchy. But will France, now military mistress of the gulph of Mexico, suffer to settle under the lee of St. Domingo a power, which might thereby become her rival in the colony trade? Certainly not; the very idea is repugnant to common sense. The consulate may perhaps permit, and even en-

\* Agriculture surely was never attended to more assiduously and successfully than it has been within these last few years; the fisheries have been grossly neglected, but the tide of attention is now setting in towards them.

† "That St. Domingo, being a state of America, would have secured the possessions of Great Britain in the West Indies, admits, we think, of no sort of doubt. To maintain that settlement, and the tranquillity of its own coasts and maritime commerce, it would have become, with the government of America, a necessary policy to encourage, and support if required, the permanency of the maritime preponderance of the British empire. The United States could then never have any thing to apprehend from a naval power, nor from armies to be carried across the Atlantic ocean direct. Nor could the West-India colonies of Great Britain be, in any wise, endangered by the vicinity of the Americans. That government in possession of St. Domingo could by no rule of prudence, nor maxim in politics, aim at the acquisition of more islands; the produce of that settlement would be abundant for the interior consumption of the United States, and for all useful purposes in their foreign trade; to attempt further aggrandisement by conquest, or to monopolize the sugar trade, could not fail to combine Great Britain and France against them; a circumstance that, were they in possession of all the sugar-islands, they could not be prepared against for centuries to come."

courage America to quarrel with Spain, with Portugal, or with Great Britain; but the republic will reserve to herself the objects of their differences, as a pledge of their future tranquillity."

As to the *military force* of France, it appears\* to be equal to the military force of the rest of Europe, Russia excepted; "the peace of Nimeguen made the dominions of Louis XIV. the most compact and populous kingdom in Europe: that of Utrecht extended them to Spain and the Indies, and a natural consequence was the consolidation of the military preponderance of that monarchy. The present situation of Holland, Germany, and Italy, was then foreseen, and the rising of Great Britain itself was predicted." It is shrewdly and sneeringly remarked, that the former was the 'preliminary' to the subjection of Europe, and the latter the 'definitive treaty:' the one put France in an offensive position, the other destroyed the defensive means of all her neighbours.

From this general view of the subject it appears, then, that

"The political advantages which the republic, in a military point of view, possesses, in preference to her neighbours, are,

"1. An immense, secure, annual revenue.

"We have already observed, that the European territory and industry of France are capable of producing, without inconveniency to the public, 80,000,000*l.* sterling to government.

"Or, if we take fifteen per cent. as a medium assessment by cadastre, of the property and income of the nation, it will give the said sum and upwards.

"From these thirty millions deduct about two millions, which the consulate is yet pleased to allow to the creditors of the state, and there will remain a clear and unencum-

bered revenue of 28,000,000*l.* sterling. A sum equal to, if not exceeding the unencumbered part of the revenues of all the independent governments of Europe. Add to this, that, in all other European states, the public imposts, as they are raised, amount to upwards of thirty per cent. upon the income of the taxable part of the community.

"2. The military organization of the republic.

"By the conscription-laws, every male is liable to serve in the lowest military capacity: there is neither legal exemption nor privileged preferment: and consequently, there is no subject for jealousy in the army, nor for discontent in the community. In France upwards of six millions of men are able to carry arms; of these, two millions and a half are between 18 and 23. Any number of these young men may be armed and put in motion by a *parole d'ordre*; for both the legislation and sovereignty of the republic are in the staff of the army: the military is the only road to consideration and power. And such is now the reputation of that profession, that, to avoid the contempt of the public, it is necessary either to serve or to have served. These are advantages which no other government possesses.†

"3. The frontiers and avant-posts of the republic.

"In a defensive point of view, since the meridian of the Roman power to the present time, no state had ever its frontiers so judiciously covered as those of the French republic now are. The strength of the frontier lines of monarchical France has often been proved; the subjugation of Holland, Switzerland, and Italy, render those lines now, we may say, inaccessible. Those vassal auxiliaries, being acknowledged by the rest of stupified Europe as independent states, may either serve as neutral outworks, or will have to maintain French armies sufficient to oppose any force that can be brought against them. Considered as offensive, the strength of her frontiers, and the localities of her several dependents, must necessarily give to the

\* For the several data from which this and other inferences are drawn we must refer to the volume itself: to state them all would be to transcribe it.

† "The absurd declamations and fallacious reports, which we daily see in the London-news-papers, respecting the tyranny of the conscription and the desertion of the young men in France, deserve no attention; they only shew, that those writers are as little acquainted with the military institutions of other countries as they are with the present state of the republic. In every part of continental Europe, the lower orders of the community are as immediately subject to military service as they are in France; and with that aggravating difference, that the baptism of every male is the act of his enrolment; infirmity or death is the only term to which he can look forward for release; neither talents, bravery, nor other merit, can advance the rank or better the condition of an European bondman. It should likewise be considered, that it is not the low situation in which the great majority of mankind is placed that induces them to complain of their lot, it is the difference they see between themselves and others that makes them dissatisfied and oppose their superiors; in as far as relates to the conscription system in France this difference is professed to be done away, and the mass of the nation rejoice at it. Besides, we know for a certainty, that it is only the rich and easy who complain of military tyranny; and their desertion will rather facilitate than impede the operations of government."

armies of France a decided preponderance in Europe. From the Ems, up the Rhine to Basil and Feldkirk; from thence by Verona and the Adriatic-sea to Calabria, the republic is covered with a chain of double and triple lines of natural barriers and military posts. Secure at home, her avant departments, open to her armies every part of the continent from the Morea to Pomerania; Bonaparte's legions may be at the gates of Vienna and Berlin, before the Austrian and Prussian cabinets have any suspicion of the Consul's hostile intention. Lord paramount of Naples, the cession of Malta, and all other military and naval stations in the Mediterranean, by Great Britain, puts the Turkish government under the immediate direction of the consulate. With the command of Constantinople, or only enjoying the freedom of navigating the Dardanelles and Bosphorus of Thrace, the republic will check the operations even of Russia itself; and may make that mighty empire subservient to her future projects."\*

4. Her colonies and settlements abroad; these are concerns of a very subordinate nature to France, considered as a source of revenue or a nursery for sailors, but to the consulate these foreign settlements are of high importance.

"Considering how the great sources of our maritime power are scattered, the whole island of St. Domingo, the boundless countries of Guiana, Louisiana, and the Floridas, with the invaluable settlement of the Cape, are, in the hands of the chief consul, offensive stations of the most formidable nature. Making her armies subservient to the cultivation of the soil, these possessions will become such military departments, that, when the republic shall again think proper to find a pretext to quarrel openly with Great Britain, Jamaica and Brazil may be easy conquests; or, should the consulate limit its operations in America, as some think it will, to a free trade with the Spanish and Portuguese colonies; France will in that case have ample means to raise and keep up a maritime force, proportionate to her military preponderance.

"We have already stated, that the fisheries and trade of the republic, in her present situation, will employ and maintain 120,000 able seamen; the foreign possessions chosen by her rulers, having no boundaries, she may extend her settlements and augment their produce, we may say, to infinity; and by managing other powers with a pacific prudence, she may double the number of her

sailors, and secure a dominion on the ocean, before any of her neighbours be aware of her design. Commanding the powers, the ports and arsenals of Spain, Italy and Turkey, France may very soon possess the absolute sovereignty of the Mediterranean; with the Rhine, she has the forests of Germany for the use of her dock-yards; with Holland she acquires an extent of coast and a chain of sea-ports, which may enable her to raise a numerous navy in a few years."

The leading policy of France has ever been to reduce the power and political influence of Great Britain; with the same disposition she has now more power than she ever had. The annulment of the treaty of Amiens, indeed, by which we retain possession of Malta, and the consequent superiority in the Mediterranean, has abridged the consulate power in that quarter since these Sketches were written. If France, however, is mistress of the south-west half of continental Europe, Russia claims a similar dominion over the north and eastern parts. "These two mighty empires are come in contact; Berlin, Vienna, and Constantinople, can only be considered as their neutral posts, situate in their line of demarcation." The free, secure, and independent communication between the southern provinces of Russia and the Mediterranean is of too great importance to be abandoned; nor is the republic of France likely to cede the navigation which it has obtained of the Black Sea. If these two powers then do not go mutual shares in the trade and government of the Turkish empire, an event perhaps impossible, which of the parties is to give up its pretension?

"The cabinet of Petersburg must certainly know, that should the consulate be allowed to assume an ascendancy at Constantinople, or to intermeddle in the affairs of Turkey, the fate of Moscow may again be disputed at Pultava! Will the present government of France retract and leave the seraglio and St. Sophia to the desecration of Russians? In that case a Cossack and Highland army, seconded by a Russian and British fleet, might yet confine the empire of Bonaparte to the government of his Gauls of the west. Or can the ambition of Russia and the avarice of France be satisfied with a partial partition of Turkey? It is a known fact,

\* "The ascendancy of the consulate at Constantinople, and the free navigation of the Black Sea, now allowed to France, cannot fail to produce effects of great importance; these two circumstances must either cement and strengthen the political ties that are already existing between the consulate and the emperor of Russia, or they must break off the connexion. Should Russia and France continue friends, they will co-operate and subdue Asia, as they have done Europe. They cannot now separate without quarrelling, and in that case they will crush the world between their mighty armies."

that the consul did propose to the court of Petersburg to leave Moldavia, Walachia, Bessarabia, Bosnia and Servia, to the disposal of Russia and Austria, on condition that France might possess Candia, Negropont, and other Greek islands in the Archipelago. But Russia would as soon see France in possession of the canal of Constantinople and the Crimea, as suffer her to fix her feet on posts that might soon command the communication between the Black and Mediterranean seas. To propose an entire partition of the European dominions of the Turks, to whom give Thrace and Constantinople? Besides, Russia will never agree to a division that shall leave the Grecian islands to France; nor can it be expected that the consulate will leave the Bosphorus to Russia.

"Thus between these two governments matters seem to come nearly to a crisis. Considering the characters of each respectively, and the powers and attitude of the two empires, if the consul possess only the half of those transcendent talents which his panegyrists are willing to allow him, he must certainly see, that their present cordiality cannot be of long duration.\* And he is no doubt likewise aware, that while Great Britain can powerfully interfere, to risk a quarrel with Russia would be imprudent and dangerous.

"In this situation it appears to us, and indeed daily occurrences seem to confirm our opinion, that the plan of the chief consul is, to manage the court of Petersburg until he disengage his rear; that is, until he shall tie down the British government to passive inactivity."

There is a prophetic tone in these spirited remarks, which subsequent events have verified: France is often successful in the field, and *always* in the cabinet. She has not quarrelled with Russia, but it is notorious that each regards the other with a most vigilant and suspicious eye. Our author, in common with every Briton, deprecates the treaty of Amiens, or rather he laments the necessity of acceding to the disgraceful terms of it. He contends that

"At no period of the war was the situation of France so critical as just when the preliminaries of London were signed. To have lost the battle of Marengo, might have lost the progress of the campaign, but the consequence would have been nothing more. At the juncture we refer to, the existence of the republic, the destiny of France, hung upon the will of an irritated and all-powerful enemy. The British navy was completely mistress of the ocean, of the Gulph of Mexico, the Baltic, Mediterranean and Indian seas; from the Point of Florida to Cape Horn, and from Madagascar to Japan, every island, port, and place, were under our command, and at our disposal; as were also the continent of Africa, Egypt, Syria, Natolia, Cyprus, Candia, the Morea and Grecian islands, Malta, Sicily, and Lisbon. No nation ever stood in such a posture. And sue for peace! A frank declaration to the world, and a liberal proposition to the court of Petersburg and to the United States, would have instantaneously rallied all the sovereigns of Europe and America (the king of Spain not excepted) around the British standard. Then we might have consolidated our maritime empire, every state that bordered on the sea would have become our natural ally, and all civilized nations our cordial and constant friends. And France, republic or monarchy, no matter which, might have been finally remanded within the limits of her own legal dominions. These Bonaparte saw, and by an address, (or perhaps from our want of address) he snatched away the fruit of all our toils. The very means we then possessed to have interwoven the interests of Europe and America with our own the consul is now dealing out to unite the world in enmity against us."

Of the solicitude of the First Consul to reduce the power, and particularly the naval power of Great Britain, there certainly can be no doubt: he is possessed of no ordinary talent, spirit, or perseverance: that he will make some desperate attempt is probable, but where the existence of the British empire is at stake

\* "It is truly pitiful to see public ministers and men charged with the defence of nations, cajoling themselves in the hope, that Russia and France will quarrel and fight! Quarrel they certainly will, but when that event takes place, woe to their neighbours! While at peace their mutual preponderance requires only dependency and obedience: at war their hostilities will impose upon the eastern continent submission and slavery.

"When the Czar and the Consul draw forth their legions in hostile array, mediation, armed coalitions, neutral conventions, and demarkation-lines, will be of little avail. Those powers have long been unused to cabinet warfare, and to courtier *étiquette* in the field. The intervention of other states may hasten their own subjection, but cannot ward off their fate. The chieftains of Russia and France will meet nearly on the centre of the world: the object of their quarrel will not be a bishoprick, a sugar-island, nor who shall read their mass in latin, or say their prayers in greek: they will fight for the possession of the Hellespont and Bosphorus, two posts on which hangs now suspended the empire of our eastern hemisphere. Such contending parties will not come out to skirmish and then mutually retire; nor will they fight for conquests to give away; the one will keep the field, and with it the dictatorship of the world."

her sons may very safely be entrusted with the defence of it. Italians, Mamelukes and Spaniards, the First Consul can drive before him,

— In vain has Nature form'd  
Mountains and oceans to oppose his passage;  
He bounds o'er all, victorious in his march:  
The Alps and Pyreneans sink before him,

but let him venture on these shores, and he will find a nation 'with a soul in it,' he will find us as one man rising to oppose his progress, and roll back his legions.

#### RUSSIA.

Such are already the extent and situation of the territories of this mighty empire, the nature and abundance of its produce, and the number of its population;\* that another Peter, says our author, a Catharine, or an *Alexander*, may extend its dominions to the extremities of Europe and *Asia*; and its politics, guided by the interests of the state, have as little connexion with those of other nations 'as the etiquette of the court of Peking has with the ceremonies of the conclave of Rome.' This empire, one half surrounded with an unnavigable ocean, and six-sevenths of the other half covered with Asiatic nations and wandering tribes; mistress of the Baltic, Livonia, and Poland, of the Black and Caspian Seas, Georgia and the Caucasus; though its own frontiers are inaccessible, can pour her resistless legions over every part of continental Europe and Asia. "Commanding, as she doth, the Sound and the Belts, *if she do not lose the Bosphorus*, no check whatever can be set upon her future operations." And is it indeed true, that a prince of ambition and talent at the head of a Russian empire might place himself at the head of our eastern continent?

"The insurmountable difficulties that it is said would attend the march or passage of a Russian army through Parthia and Bucharra to Cashmire and Cabul, or by the Euphrates to Bassora, reminds us of Mr. Canning's crocodiles that eat up Bonaparte's army on the banks of the Nile! And the estimations drawn up to shew the force which the Persian cavalry and the Arabian strollers would oppose to such an expedition, seems to be made from the same scale, by which we lately saw calculated the resistance the valiant Swiss were to make to the legions of France. How

is it possible to presume that Persia, in its present state, could make any opposition to the demands or operations of Russia? From Astrabad to Ispahan, is not further than from York to London. From the port of Zauze or the Tendzen river, and from the Aral-lake to Cabul, is only about as far as from Oczakow to Teflis. A million of camels are to be found on the roads, and should a Russian army be pleased to purchase them, they cost only about the value of forty shillings a-head; a hundred pound weight of wheat costs fifteen-pence, as much salt two-pence, an ox of six to eight cwt. about twenty shillings, and a sheep of two hundred pounds four shillings sterling. We can scarcely believe that an army of Cosacs and Kalmucs would find such a country impassable; especially when they are told that Taimas Kouli-Khan, on an excursion of pleasure rather than an expedition of war, brought a booty worth sixty millions sterling out of Indostan. And would the Grand Signor refuse a passage through his territories to Bassora, when only to demur upon the demand might cost him Constantinople? If the safety of Delhi, Agra, and other places in India, depend upon their distance from the frontiers of Russia, and upon the difficulties and dangers of the route, we would recommend to the Mogul and those concerned with him, to make terms, or hide their treasures as soon as they can.

"We are told in England, and it is said, that writers have been paid to prove it, that the trade of Indostan cannot be carried on through Persia and Tartary by Russia; nor through the Persian gulph and Red Sea by France. That may be, but should these powers conjointly, or either of them, acquire the dominion of India, doth that imply that the trade of Asia with Europe must change its usual channel? We believe not. The French republic will, we know, very soon possess herself of Brasil, and she will bring the produce of that country across the Atlantic as formerly. That the British and Portuguese navies could interrupt the passage is possible, at least for a time; but what benefit could that produce to either? Besides to keep those navies equipt, Indostan and Brasil are perhaps as necessary as water is to keep them afloat."

Our author reprobates with great severity, our quarrel with the northern states. He asserts that the object of the war was not worth to Great-Britain the *little-finger* of a British sailor; that it evinced an obstinate adherence to the most despicable principle in politics that ever was countenanced by a great nation; that of avenging upon weaker

\* Exclusive of Georgia, amounting to forty-two millions; whereof there are upwards of twenty millions of male peasants, 700,000 enrolled soldiers, and 50,000 servants for the staff; and 1,200,000 free men of all descriptions.

neighbours, wrongs received from powerful states; and lastly that the war, without producing any sort of benefit to Great-Britain, organised and cemented an universal combination of hostile enmity against the British empire!

If the revenues of Russia then are so enormously great, and her resources almost incalculable; if France, with almost rival means, is actuated by a dangerous spirit of aggrandizement and domination, it was incumbent upon Great-Britain, who must consider herself as the object against which the intrigues and hostile preparations of both these governments, so long as they continue in political connection with each other, are directed; it was incumbent on Great-Britain to have directed all her power and influence towards the support and augmentation of the lesser states of Europe, and to have preserved them as much as possible, independent of those two mighty powers.

"These were, prior to the peace of Utrecht, Holland, Spain, and Austria; and until the capitulation of Nysted, in 1721, Denmark and Sweden came under the same description. To raise and keep up the maritime states, to extend their dominions at home and their possessions abroad, should have been our peculiar care; their interests were our own, and upon our prosperity depended their existence." But the world must not be given up for lost: it is the interest of Russia as well as of Great-Britain to oppose the gigantic strides of France; nor can America be indifferent to her restless and domineering spirit. A friendly intercourse, therefore, and close political connexion between these powers is recommended, as forming, perhaps, the only efficient check to the licentious career of the French Republic. "Any partial alliance or treaty for subsidy which Great-Britain can make on the continent of Europe can only produce the instantaneous subjugation of the continental party. But to form a permanent connection with the government of the Russian empire, and to defeat the jacobin machinations of France in America and in our settlements abroad, the British Government must resume a Bri-

tish character, and adopt a system of politics analogous to the present situation of the world and the political state of Europe. Honesty and candour in negotiations, bold simplicity in public measures, and vigorous perseverance in their execution may yet save the state. Such are now become necessary."

The intrinsic importance of the subject itself, and the bold, the masterly, and commanding manner in which it is treated, have prompted us to make more ample extracts from this volume than we are in the habit of allowing ourselves. This is no flatterer, no smiling politician, tickling our pleased ears 'with holiday and lady terms' to gain the noisy clap of popularity; we see the stern unbending patriot, anticipating the declension of his country's interests and pre-eminence among nations, and holding up a vigorous arm to save it. The physician has investigated the disease with carefulness and sagacity: instead of attributing it, in order to avoid giving offence, to any and to every cause but the true one, he tells you honestly, though bluntly, that your debility arises from your own intemperance, and that you have grown worse and worse by following the unwholesome prescriptions of ignorant time-serving quacks. To drop the metaphor, we find in the author of these Sketches, a politician whose piercing eye has penetrated into the interior of the several continental cabinets; who has made himself acquainted with their respective strength, views, and interests; who is alarmed at the growing resources of our ancient hereditary foe, and has pointed out to his parent country, the line of conduct she must pursue in order to humble his high-crested pride, in order to retrieve her own injured reputation abroad, and ensure her security, perhaps her existence as an independent nation, at home.

We cannot close this article without mentioning, that we are promised a second part of these Sketches, which will contain a general view of the politics and diplomatic history of Great-Britain, from the peace of Utrecht to the present year of the French consulate.

ART. XXIII. *The Five Promises : Conduct of the Consular Government toward France, England, Italy, Germany, and especially Switzerland.* By Sir FRANCIS D'IVERNIS. 8vo. pp. 350.

THE financial system of the French, says with precise justice a manifesto of Bonaparte, reposes exclusively on their soil and their courage.

The *contribution foncière* and the *recette extérieure*, are in fact the chief sources of governmental income.

The *contribution foncière* closely resembles our assessments, with the addition of a rent-tax. The doors, windows, carriages, and servants, of each house-keeper are enumerated; an estimate of the value of the furniture is inserted; the rent is recorded; and on all these particulars a tax is levied, at present so moderate, that in a nation less military, it might speedily be doubled without inconvenience. This tax is chiefly odious among the small proprietors of land: it is chiefly evaded at Paris, where the government is shy of making enemies, and where the facility of shifting residence renders evasion easy.

The *recette extérieure* is a tribute impudently exacted from Spain, Holland, and other contiguous countries, as the price of neutrality, security, or autonomy. The independent nations of Europe ought to resist such levies, by instantly withdrawing their recognition from all those states which submit to them. From the moment a real independence has terminated, it is time lost to dissemble the conquest; and only enables the over-awing power to secure a larger proportion of the eventual partition.

Both these classes of revenue are admittedly progressive in France. There are other symptoms of increasing internal prosperity. Witness, the indirect taxes, which during the last three years have produced as under,\* neglecting fractions.

Indeed the minister Gaudin appears to have introduced great order into the collection of the revenue; and although it cannot be doubted that the expenses of the French government are increasing, yet the means of meeting those expenses extend with still greater rapidity. Governments are strong in proportion to the circulation of which they

are the organ: they derive power both from what they levy and from what they pay; and far from acquiring influence or popularity by economy, they usually acquire it by magnificence.

Notwithstanding these facts, Sir Francis D'Ivernois persists in drawing his old inferences, that France is verging on new bankruptcies; and that French power (which is a far wilder inference) would by new bankruptcies be brought to the brink of ruin. To encourage this country in a war of finance, is like encouraging a man of property to gamble with an adventurer: if he breaks his antagonist he has not gained any thing; if he breaks himself, he has lost every thing.

We have much more faith in the representations contained in Mr. Necker's "Last Views of Finance" than in those of his fellow-citizen: he makes the revenue of France amount to twenty-three millions sterling. The consequence of understating the income of all governments is to strengthen those governments, and to provide an apology for new levies; it predisposes authority to timely precaution, and the people to patient acquiescence. Mr. Necker understands far better the art of letting down an authority: "What a country," he said to Louis XVI. where subordinate economies and imperceptible objects would suffice to banish the very appearance of a deficit." He now says to Bonaparte, "Behold France rising from beneath her ruins, as opulent as ever."

The expenditure of France appears here to be estimated with little exaggeration, and to approach nearer to probability than the estimate of income: It runs thus according to the postscript:

"Let us now proceed to the principal article, namely,

*"Expenditure present and future.*

"Every one, who has attended to the French budgets, must remember, how uniformly the Directory promised, that at the peace the expense of the army should be reduced to one hundred and fifty millions; and

	Year VIII.	Year IX.	Year X.
* Enregistrement,	55,789,000	71,219,000	80,665,000
Mortgage-duty,	4,708,000	6,398,000	7,697,000
Stamps,	17,261,000	20,901,000	23,238,000
Customs,	22,860,000	29,867,000	41,066,000

that when, in the year X, the consular government raised them to two hundred and ten, it declared, by the minister of finance, that in this article there was a certainty of important reductions, which were impossible during the first moments (of peace.)

"These first moments have passed away, and he has raised the expense of the army to two hundred and forty-three millions; so that the important reductions, of which he guaranteed the certainty twelve months ago, are already converted into a certain increase of thirty-three millions. Thus, even should there be no further augmentation in the year XII, the army will cost, on the peace establishment, and under the republican government, just double what it cost under the monarchy.

"The same remark applies to the navy, the expense of which, from the year X to the year XI, has likewise increased from one hundred and five to one hundred and twenty-six millions.

"Another observation, of no less importance, is, that precisely in the same proportion in which the army and navy establishments have been immoderately increased, the new list of expenses for the year XI, the amount of which is five hundred and eighty-nine millions and a half, does not contain any one of the articles, which, as I all along foretold, would be passed over in silence.

"The sinking fund is the only one of which mention is made, and this is stated at no more than five millions, though the government stands engaged, by a decree, to make it ten, commencing from the year XII. The same may be said of the roads, this article of expenditure not being stated at one fourth of the eighteen millions which the government intends appropriating to them. Lastly, a profound silence has been observed on the floating debt, which amounts to above a milliard and a half, (about sixty millions sterling); on that part of the debt already funded, the interest of which will commence in the year XII; on the army of reserve; on the legion of honour; on the new departmental senatorships; and even on the new lyceums; the expenses of which are doubtless intended to be thrown upon the departments.

"However important these omissions may appear, they are far less so than that of the clergy, in favour of whom Bonaparte had instituted an eighth department of administration; the only one not set down for any share in the probable expenditure for the year XI. All that I have been able to discover in the accounts for the preceding year, when the extraordinary installation of the bishops was to be provided for, is, that the whole Gallican church of France was unable to obtain a sum equal to that which was swallowed up by Bonaparte's privy counsellors alone. Scarcely has the impious author of the concordat devoted to the service of the Deity

twice the amount he devotes to that of the opera and dramatic art!

"The omission of these seven articles itself constitutes an additional deficit of near one hundred millions, which does not appear in the consular budget. The treasury, however, will not perceive this deficit till the consul shall have realised all these promises.

"Strange as such omissions may appear, it is far more so, that the tribunes, to whom Bonaparte thought proper to submit his accounts of the receipt and expenditure, considered them so well proportioned to each other, and so complete, that they have solemnly thanked him for rendering, in less than thirty months, the finances more flourishing than they ever had been since the year 1688, when Colbert died; that is to say, they thank him for having gloriously restored the equilibrium, by inserting in the account of the revenue an external receipt of twenty millions, and obliterating from that of the expenditure seven articles, which will amount to at least a hundred millions.

"Notwithstanding this gross artifice exhibited in the new budget, the accounts of receipt and expenditure, which accompany it, induce me to think that it is less difficult to restore the equilibrium, than was once imagined; and that it might be accomplished by at once adopting the two following measures:

"1. A retrenchment of one hundred millions in the expenses of the army and navy; not only perfectly easy in itself, but at the same time the surest mode of consolidating that peace, to which the minister of finance principally attributes the improvement in the revenue.

"2. A diminution of at least fifty millions in the land tax, together with a reform in all the expenses of show, beginning with the civil list of the consuls, the senate, the tribunes, the legislative body, and the legion of honour.

"If I am not very much mistaken, republican France will never be able, without these two reductions, to return to a pacific system, to a state of prosperity, to find within herself sufficient resources to enable her to go on without plunder, without tributes, and without external receipts."

Very unfavourable and certainly overcharged accounts of the internal distresses of the French are given in various places, as (at p. xxiv.) of the roads, which (the writer speaks from personal observation) are good already, and in a state of active amelioration. The cottages of the peasantry have improved in neatness and embellishment within these twelve years. The small farm-houses are more elegant and more numerous. The *guinguettes* of the lower classes are cleaner, and let higher.

The wages of vulgar labour in the country have risen about a fourth; and the consequent increase of ease and luxury in the most numerous class is real and apparent. The quantity of waste land has decreased, and a very industrious agriculture prevails. Still the excessive subdivision of estates, the mischievous smallness of farms, which are mostly occupied by the owner, and the deficiency of stock and capital, render French agriculture less productive than our own. A conscription of 120,000 men, requires but two men and a fraction out of each commune, which is a consolidation of three or four parishes, so that the requisition is little felt, and substitutes have seldom cost more than one-third of what is paid here to supply the army of reserve.

The historical digressions in this work of Sir Francis D'Ivernois, are of more value than that part of the work which respects the finances of France: none better deserves the attention of Europe, than the appendix which respects the justly odious conduct of the French in Switzerland.

"Bonaparte has omitted nothing in his power, to obliterate the Swiss from the list of independant states; he has reduced the great bulk of that people to utter desperation, and to ensure their peaceable submission, he finds himself above having recourse to any other measures than those of restoring their arms, and withdrawing his army, at the very moment in which he takes from them every means of maintaining their own tranquillity! Thus it is, that he thinks it necessary to bolster up the odious laws which he has forced on them, by no other support than that of his name, and of the heterogeneous 'amalgama' imposed upon them, an amalgama equally detested by both parties. After this, lest any observer should have retained a doubt of the real object of the first consul, he himself most fully explained it. When he dismissed the Swiss deputies, he disclosed the secret of his system toward their country, and proclaimed it to the world through the newspapers of Paris; 'If,' said he, 'you shall again fall into a state of anarchy, I must reduce you to order by force, and by the annihilation of your independence\*.'

"Who is so blind as not to see in this declaration, that by thus having in some cantons permitted the predomination of the friends of order, and in others forcibly established the triumph of the jacobins, he is sowing the seeds of new commotions? Agitated as the inhabitants of Switzerland have

been, his contrivance of leaving them to themselves may not improbably produce some internal measures of opposition, which the dictator will brand with the stigma of rebellion. Then will he represent to the world, that finding his benevolent intentions frustrated by the prevalence of internal factions, no remedy is left but the immediate incorporation with France, of those cantons which prove themselves incapable of the liberty which he had provided for them, and unfit for the absolute independence of which he had thought them worthy. 'Can I,' will he say, 'suffer such a source of inquietude to continue? must not this anarchy produce the most dangerous consequences? have I not exhausted the utmost efforts of kindness? shall I be held excused, if I leave to themselves people who thus tear themselves to pieces?' &c.—Nothing can be more easy than to anticipate the new manifesto which is preparing for them, and which in all likelihood will, in the first instance, be addressed to his *protégés* in the *pays de Vaud*.

"In this last scene of the political drama which their protector is exhibiting, he will not fail to remind them, that he has always held the same language, and truly in this instance he will have a right to say so: his last declaration by word of mouth, that he would reduce them to order by the annihilation of their independence, is probably much more sincere than the assurance which he sent to them in June 1802; when on withdrawing his troops, he solemnly asserted his repugnance to take part in the internal affairs of other nations.

"After he had satisfactorily proved to the Swiss the reality of this repugnance, by manufacturing for them nineteen constitutions, and committing several of them to the charge of the very men whom he had before reproached with the overthrow of the legitimate government of M. Reding, he had only to decide on the fate of that individual, and five other prisoners at Arbourg. To have prolonged their confinement, would have been absurd, as its only object was that the severity of their treatment† might induce them to assist at the consulta at Paris, where Mr. Reding's presence would indeed have completed the triumph of the mediator. At the first mention of such a proposal, he only replied, that having already unsolicitedly represented his sentiments to the first consul, he had no farther communication to make to him. Afterwards, when they had the assurance to repeat their attempt, he by his silence demonstrated to his jailors, that he never retracts his resolutions.

"I know not whether my readers will agree with me, but in my estimation, the illustrious Aloys Reding voluntarily submitting to wear chains himself, rather than assist in forging those of his country, and repelling

\* "See *Journal des Débats*, March 18th.

† "They were all like malefactors, locked up together in one room.

this last insult without indulging in any re-erimination, is an object worthy if possible of higher admiration in the prison of Arbourgh, than on the plains of Mortgarten.—This is indeed the *homo fortiter miser*, whom Seneca describes as the noblest spectacle of the creation. *Ecce spectaculum dignum, ad quod respiciat intentus operi suo deus. Ecce par deo dignum, vir fortis cum malâ fortunâ compositus utique si et provocavit.—Ita affectus sumus ut nihil æque magnam apud nos admirationem occupet quam homo fortiter miser.*"

To the general information, to the industry, and the sagacity of Sir Francis D'Ivernois high praise is due. His vindictive aversion to the French oppressors of his country, does honour to his republican spirit. His animosity against Bonaparte is shared by every enemy to usurpation or tyranny. The first promise which the consul is accused of having broken is *respect for property*; the second is *respect for the constitution*; the third, *peace, and moderation to the vanquished*; the fourth, *not to interfere in the domestic concerns of other countries*; the fifth, *to restore public credit*. Under each head facts are detailed, which convincingly show a repeated departure from these professions; yet there is a something in the plan of criticism, not altogether dexterous and consistent. Some of the complaints tend only to render Bona-

parte odious *out* of France: these should have been separated into some address to the Swiss. Others only tend to render him odious *in* France: these should have been separated into some address to the French; and might have been powerfully strengthened by a person duly acquainted with the state of opinion in Paris. In some places Steigner, an aristocratic chieftain of the Swiss, is unaccountably applauded: he is supposed to have stimulated those measures of the Senate of Bern, which, by destroying the hope of domestic redress, founded a French party in Switzerland. Elsewhere Reding, the purer chieftain of a purer cause, is applauded with like zeal, and with less reserve. The art of hostility does not consist in indiscriminate, in perpetual, or in contradictory opposition; but in selecting the most uniformly thwarted interest for the especial object of protection, and in dropping all grounds of discussion which interfere with its sympathies. Bonaparte is a hero of the anti-jacobins, not of their adversaries; it is in the name of outraged liberty that he should be devoted to the abhorrence of the nations he enslaves. The restorer of popery and monarchy is sure of the perennial praise of the priest and of the courtier.

ART. XXIV. *The Importance of Malta considered.* By G. ORR, Esq. 8vo.]

WHEN Richard Lion-heart coveted the Holy Land, he began by taking possession of the island of Cyprus. Perhaps the shipping then in use could be well accommodated there, but not modern men of war.

Rhodes was long a seat of maritime power: is its best port become a mere haven for sloops and feluccas?

Is Lampedusa, though so dear to the muse, worthless to the armed Neptune? Is it as a maritime arsenal useless and contemptible?

One must presume, at least, that a nation, whose charts are the best in Europe, has been unable any where to detect a naval station in the Mediterranean; since she has thought fit to set so extravagant a value on Malta, as to think her infinitesimal fraction of a right to it worth a war.

Mr. Orr endeavours to demonstrate this value. He justly calls it the watch-tower of the Mediterranean, and recounts the advantages it afforded during

the Egyptian campaign. Very true. But will no other island answer all these purposes nearly as well?

Mr. Orr takes it for granted that it is always an object to us (p. 22) to interrupt the proceedings of the French; whereas, it ought to be an object to us only to interrupt those proceedings of the French, which tend to interfere with our own national interests. By interrupting last war their aggrandizement *southward*, we have compelled them to extend themselves in the *north*, and are now wholly unable to eradicate them from Holland, from Westphalia, from Denmark. Never was such want of statesmanship displayed as in the selection of enterprizes during the anti-jacobin war.

In the progressive partition of the world, Great Britain, from geographical causes, cannot aggrandize herself. Her interest, therefore, is to promote the institution of new independent powers, among whom she may preserve her old

relative rank; and not the perpetual addition of territory to those already in being, who thereby become relatively, as well as positively, greater.

ART. XXV. *The Importance of Malta considered, in the Years 1796 and 1798: also Remarks, which occurred during a Journey from England to India, in the Year 1779.* By MARK WOOD, Esq. M. P. late Chief Engineer, Bengal. 4to. pp. 78.

IN the year 1796, Mr. Wood addressed a letter to Messrs. Pitt and Dundas, and in the year 1798 he addressed two letters to Mr. Dundas alone, exhibiting in the most clear and satisfactory manner the high importance of Malta to Great Britain, as a depôt and guardian of our commerce in the Mediterranean and Ionian seas; and as affording the most effectual, if not the only, means of protecting our eastern empire from the insatiable ambition of the French republic. Malta is truly represented as "that station which would give us completely the command of the Levant, since not one ship from thence could sail to or from any port in Europe, unless, by our permission or under convoy of a superior fleet; the coasts of Spain, France, Italy, and Africa must be subject to our control, and, whilst at war with this country, be kept under necessary subjection. From Africa and Sicily we could have ample supplies for our fleets and garrisons; and by the Dardanelles, from the Euxine and Caspian seas, inexhaustible supplies of various naval stores, which, if not secured to ourselves, must inevitably find their way to the arsenals of France."

These short letters do the greatest credit to the sagacity and political foresight of Mr. Wood: Bonaparte's expedition to Egypt is distinctly foretold, and even the measures which he pursued when in possession of the country, are anticipated. But it was not the custom of our last ministers to profit by the superior knowledge of private individuals, or act upon advice—till it was too late to be of service.

In the year 1779, Mr. Wood received a note about mid-day, from Mr. Wilkes, clerk to the secret committee of the court of East India directors, desiring to see him on particular business: he attended, and, under injunctions of secrecy, the desire of the committee was

communicated, that he would charge himself with their dispatches, as well as those of the secretary of state, and proceed with them overland to India *that evening*. Mr. Wood, accordingly, set off on his journey, which he pursued with the utmost expedition, according to his instructions, by way of Holland and Germany to Venice, and thence by Alexandria, Grand Cairo, and Suez, to Fort St. George. If the contents of his dispatches had not been represented as of the highest and most pressing importance to the British nation, the tenor of the instructions, that every thing but security was to be sacrificed to expedition, would have justified the inference. But it was the mountain in labour!

"From the tenor of our instructions, as well as conversation of Mr. Wilkes, every person would have believed the dispatches to have been of infinite importance; and as the French had been expelled from all their settlements in India, and Sir Edward Hughes, with a large fleet of men of war, accompanied by troops in transports, had sailed for the East only a few days before, I naturally concluded that his destination was against Mauritius, and that I carried orders for troops and stores to be immediately sent from India to co-operate in this expedition. A large army of near 30,000 men was at this time in and about the Carnatic, totally unemployed, and as many in Bengal. On my arrival at Madras, I was not a little surprised to find that, excepting honours for Sir Thomas Rumbold and Sir Hector Munro, my dispatch merely contained orders for destroying the fortifications of Pondicherry. As I reached Madras many months before Sir Edward got as far as the Cape, the facility with which such a plan could have been executed is obvious, and Sir Edward might have performed this service and reached India as soon as he did."

The remarks in this rapid journal may be serviceable to those who are employed in a similar expedition.

ART. XXVI. *The Possession of Louisiana by the French considered, as it affects the Interests of those Nations more immediately concerned: viz. Great Britain, America, Spain, and Portugal.* By G. ORR, Esq. 8vo. pp. 45.

THE best thing for Louisiana would have been to belong to Great Britain, whose superfluous capital and population would more rapidly have settled the country than that of the Americans.

The next best thing for Louisiana is, to belong to the United States, whose equitable legislation and pacific habits render them the most excellent sovereigns on the face of the earth.

During the anti-jacobin administra-

tion the first event might have taken place without much difficulty: during that of Mr. Addington, the second has taken place.

It is folly to repine at the unalterable; but it is not folly to endeavour to obtain ministers, who will seize those opportunities of aggrandizing their country, which events present once, but not again.

ART. XXVII. *An Inquiry into the Colonial Policy of the European Powers.* By HENRY BROUGHAM, Jun. Esq. F.R.S. 8vo. 2 vols. pp. about 600 in each vol.

THE antiquities and theory of colonial policy have already engaged many celebrated pens. M. de Bougainville composed a valuable work *Sur les Devoirs reciproques des Metropoles et Colonies Greques*. M. de Saint Croix, with greater minuteness, investigates the colonial systems of the ancients in his book *De l'Etat et du Sort des Colonies des anciens Peuples*. Heeren, among the Germans, has treated the subject with exhaustive erudition, and \* Barron, among ourselves, with scanty condensation. Concerning the modern state and government of the European settlements, works abound in every language: in none more than in our own.

It does not appear to have been the object of Mr. Brougham to excel or supersede his predecessors in antiquarian research, or in statistical information; but rather in speculative commentary. His inquiry announces great talents and great acquirements; but it has the fault (if fault it be) of being drawn up in too professor-like a manner. The preliminary information is far-fetched and comprehensive; but it includes notorious and trivial intelligence. The subdivisions of the subject are methodical and numerous; but they allot places, like a marine packing-chest, to ordinary utensils. The walk is through a suite of apartments admirably distributed and sufficiently furnished: but room succeeds room with needless repetition, before one reaches the apartments, in which acquaintance can be formed with the personal and peculiar mind of the author. As a book for vernacular instruc-

tion it is copious and well-devised: as a manual for the statesman it wants condensation: it aims rather at exhausting than at advancing a particular branch of political theory; and resembles a course of lectures more than a fit of research. In stock of fact it does not abound: but in the speculations of hypothetical and inferential reasoning much time is passed. Yet the data of experience, to which appeal is made, are so well selected as to imply an extensive knowledge of historical event, a great command of fact: while the metaphysical generalizations display such a fibrous branchiness of argument, as leave no doubt of the luxuriance of the writer's logical powers.

The first book treats of the relations that subsist between a state and its colonies. The following commentary on the colonial policy of the Carthaginians is further corroborated in a learned note.

"It is remarkable how exactly the history of the Carthaginian monopoly resembles that of the European nations who have colonized America. At first, the distant settlement could admit of no immediate restraints, but demanded all the encouragement and protection of the parent state; and the gains of its commerce were neither sufficiently alluring to the Carthaginian merchant from their own magnitude, nor necessary to him from the difficulty of finding employment for his capital in other directions. At this period, the colony was left to itself, and was allowed to manage its own affairs in its own way, under the superintendence and care of Carthage, which protected it from foreign invasion, but neglected its commerce. In this favourable predica-

ment, it soon grew into importance: some of the Carthaginian merchants most probably found their way thither, or promoted the colonial speculations by loans; at any rate, by furnishing a ready demand for the rude produce.

"In this stage of its progress, then, we find the colony trade left free: for, the first of the two treaties, prohibiting all the Roman ships of war to approach within a certain distance of the coast, allows the trading vessels free access to all the harbours, both of the continent and the colonies. This intercourse is even encouraged with the port of Carthage, by a clause, freeing the vessels entering, from almost all impost duties. The treaty includes the Roman and Carthaginian allies; by which were probably meant their colonies, as well as the friendly powers: and the clause which expressly includes the colony of Sicily, gives the Romans all the privileges in that island, which the Carthaginians themselves enjoyed. At this period, it is probable that the commerce of Rome excited no jealousy, and the wealth of the colonies little avarice; although a dread of the military prowess of the former, seems to have given rise to the negotiation.

"Some time afterwards, another treaty, conceived in a different spirit, and formed exactly upon the principles of the mercantile system, was concluded between those celebrated rival powers. The restrictions upon the navigation of the Roman ships of war, are here extended and enforced: the freedom of entry into the port of Carthage is continued, and into the ports of Sicily also, the Romans granting to the Carthaginians like privileges at Rome. But the Romans are debarred from plundering, trading, or settling (a singular conjunction) upon the coast of Africa Propria (which was peopled by Carthaginian colonies, and furnished large supplies of provisions and money to the city). The same restriction is extended to Sardinia; and trading vessels are only permitted to enter the harbours of that colony, for the space of five days, to refit, if driven thither by stress of weather. A singular clause is inserted, to which close analogies may be traced in the modern questions of neutral rights and contraband of war:—if any Roman troops shall receive stores from a Carthaginian port, or a port in the provincial territories of the state, they are bound not to turn them against either the republic or her allies.

"The substance of this very singular document will suggest various reflections to my readers. I shall only observe, that we find in the principles of the modern colonial system clearly unfolding themselves; and that we have every reason to regret the scantiness of our knowledge of the Carthaginian story, which, in so far as relates to the commerce of that people, breaks off here, and leaves us no trace of the farther restrictions most probably imposed by succeeding states—

men upon the growing trade of the colonies."

The Carthaginians, among the ancients, and the English, among the moderns, have had much experience in colonizations: yet neither of these nations appear to have observed, that the reputation of dominion is useful to neither party; and that if colonies were founded *independent*, or autonomous, they could preserve a neutrality highly profitable during the wars of the mother-country, whose commerce and territory would thus be less vulnerable. This independence might indeed require occasionally an armed support, which would then become the object of a specific subsidiary treaty; and the colonists would thus tax themselves for their own protection. By retaining the monopoly of the colonial trade, we diminish our own returns, and we retard the commercial progress of the colonies; by retaining the sovereignty we bring on ourselves the whole expence of defence; and if we attempt taxation, we incur, as the Carthaginians often did, an ungrateful war of the colonists for autonomy.

In the second section much is said of the theory of the physiocratic sect. This doctrine now belongs to the learned lumber of the schools. From Quesnay, its first founder, to Dupont de Nemours, its last commentator, it was always a jargon, which escaped refutation by eluding intelligibility. Turgot was more than an *économiste*. Mirabeau the elder, and Mercier de la Riviere, are the least obscure apologists of the theory. The use of pushing it into reputation was merely seditious. It was an opinion well adapted to become an engine of revolution in France. Taxation on all objects of popular consumption was condemned by these theorists: taxation on a mass of proprietors, too strong to be taxed without their own consent, was recommended by these theorists: the theory therefore tended to please the croud, and to embody the landed interest. But now that it has accomplished its purpose, of bringing all the noble property under the operation of the *contribution foncière*, it is laid aside by the Parisian sophists with a triumphal sneer: and the doctrine of indirect taxation is again recommended to popular credulity, by the patronage of government. Nature and labour, matter and form, are the sources of all production and all

wealth. Society is divided into those who possess the matter, and those who bestow the form; into proprietors and labourers. Taxes on rent fall on matter: they diminish the capital value of the lands, houses, money, machines, or ships assessed. Taxes on consumeables fall on form: they diminish the exchangeable value of the labour employed in bestowing it, by endearing the objects of its purchase. It would be more reasonable always to tax the proprietor than the labourer, the idle than the industrious citizen; but the thing is impossible. Whenever a season of scarcity comes, he would raise the rent of his lands, houses, money, machines, or ships, and thus assess much of his tax on the labourer in the price of matter. And if the labourer alone were taxed, in his wine, his beer, his soap, his candle, his tea, his sugar, his tobacco, his glass, his leather, &c. he again would, in seasons of demand, raise the price of his toil, and thus assess much of his tax on the proprietor in the price of form. So that natural causes, not positive laws, regulate the proportion of burden between proprietors and labourers.

The third section is, for the contained information, the most valuable: it treats well of Dutch, particularly well of Spanish, colonial policy.

After very extensive, elaborate, and alarming commentaries on the state of the slave-system in the West Indies, Mr. Brougham thus states the result of his multifarious reflections.

“The remarks which have been made upon the character and habits of the negroes, both in the last section, and in the former parts of this inquiry, seem to suggest certain conclusions of a very positive and definite nature with respect to the internal structure of the slave colonies.

“It may be observed, in the first place, that all attempts speedily to change the state of society in those settlements by legislative enactments, are if possible still more ridiculous, and, if attended with any material consequences, still more dangerous than similar endeavours made suddenly to new-model communities of the ordinary texture.

“In the second place, we may remark, that however deficient in civilization, the negroes are evidently capable of acquiring those wants and desires which are the seeds of industry; that they are endowed with powers, not only of body but of mind, sufficient to render their improvement and high refinement a matter of absolute certainty under a proper system of management; and that there is nothing in their nature peculiar

or distinguishing, which renders them a separate class, or places them beyond the influence of the passions and principles common to all the rest of mankind in certain stages of society. Through the whole of this inquiry, I have argued every question relating to the negroes, upon the same general grounds which are used to investigate the history, or determine the probable fates, of other rude nations. All the facts with which we are acquainted, concur to justify a mode of reasoning pointed out by the clearest analogies; and the greatest errors have been committed by politicians, both in speculation and in practical arrangements, from the fundamental and vulgar prejudice of considering the Africans as a peculiar race, to whom general views do not apply. The Africans, in fact, as closely resemble every other rude people in their characters and habits, as in their circumstances. When enslaved their characters and habits are modified by the change of situation; and they become similar to all rude tribes placed in a state of bondage. When wise and liberal regulations mitigate the hardships of their lot, a door is opened for their gradual improvement and progress in civilization, according to that general principle of advancement which seems to be an essential part of the human character, and which always works its effects in the most obvious manner, unless when stifled by absurd or wicked institutions.

“We may remark, in the third place, that the mixed breed of mulattoes in the slave colonies does not render the structure of the society anomalous. On the contrary, these men are subservient to many useful purposes. They are in some respects superior to the negroes; as, in civilization and mental endowments. In bodily strength and adaptation to the circumstances of the tropical climate, they are almost on a level with the pure African breed. They are uniformly attached to the whites, in those colonies where cruel rigour on the part of the government has not alienated them, or their numbers rendered them formidable. They form, together with the free negroes, an intermediate class of men, connecting the other two, however imperfect the link or however sudden the gradation may be, compared with those uniting principles which knit and mould the more curiously arranged fabrics of European and Asiatic society. It is entirely from the influence of manners, and of positive institutions, that the people of colour have uniformly been held in a state of degradation, and even classed with the free negroes. The existence of slavery is the great cause of those manners and institutions. The free mulattoes are tinged with a hue which is almost the characteristic of degradation and bondage in the eyes of West Indians. They are related by blood to the vilest portion of the society; they are of the same race with many who yet obey the cart-

whip : while no white man can name a brother in chains. They are, moreover, from the state of morals among the whites (the immediate effect of the slave system), almost universally the fruits of illicit and vulgar amours ; they owe nothing to their mother but life ; and are, in their turn, sacrificed to the brutal passions of the common tyrants. It is evident that these circumstances which distinguish the mixed race in the colonial society, are altogether the consequences of the slave system, and of the state of manners which that system has produced. They present, therefore, no formidable obstacle to the legislator who would, by gradual and prudent measures, reform the corrupted mass, and lay the foundations of a more natural arrangement in the social union, by cautiously but firmly applying the axe to the root of the evil, and undermining the institutions that have grown up in defiance of all justice and policy.

“ The same remarks apply with equal precision to the free negroes, who indeed resemble the mulattoes in their moral and political circumstances. And as the state of society among the whites themselves is evidently affected in the most material degree by the same system of institutions which so peculiarly distinguishes the tropical colonies of America, we may with confidence conclude, that the whole fabric of colonial society has naturally arisen out of the circumstances in which legislative enactments originally placed those provinces ; that it presents no insuperable difficulties to the wisdom of enlightened reformers ; that it may receive complete and radical amelioration from the gradual abolition of the noxious and artificial establishments which have been formed by the measures of former statesmen.

“ In the fourth place, there can be no doubt that the climate of the West Indies renders the labour of negroes essential to the cultivation of the soil. It is only in their corporeal qualities that those men are fundamentally distinguished from the rest of the human species. They excel all the other races of mankind in hardiness, agility, and strength of limbs ; in the capacity of sustaining the most galling fatigue and pain ; in the faculty of enduring labour under every sort of privation, and all kinds of annoyance ; above all, in that quality which chiefly distinguishes the human body from the bodies of the lower animals, the power of submitting with ease to every change of season, and adapting the corporeal habits and functions, with safety and alacrity, to all the varieties of climate. From the first discovery of America to the present time, the experience of every day in those sultry though splendid regions, has proved, that neither Europeans nor their descendants are capable of enduring fatigue in the burning climates of the southern colonies. To the negro, all climates and soils are the same. He thrives

as well in those marshes whence the heat of the vertical sun exhales every noxious vapour, and engenders all the multifarious forms of animal and vegetable poison, as in the happiest vallies of the old world, where the breeze, the shade, and the stream, temper the genial warmth of the most serene and fragrant air. As long, therefore, as the colonies are cultivated, the population must consist of a mixed and variegated tribe. The great object of the legislator is the improvement of that state of society ; and that system of manners, which have arisen from the necessary introduction of distinct races of men, differing from each other in civilization, in bodily qualities, and in political privileges. The only plan which can be admitted into our thoughts must proceed upon the principle of new-modelling the present structure of society, and retaining at the same time all the parts of which it is composed.”

To this melancholy inference all the preliminary observations of this fluent writer have not disposed us entirely to accede. Legislative enactments may very speedily change the state of society in the wholly cultivated islands. In these, a heavy and fast increasing duty on the further importation of negroes might render the domestic rearing of labourers cheaper than the importation of them. A disposition to use kindly, and to emancipate frequently, the *vernacular* slave, would soon succeed to the present insolent contempt for the black cattle of Africa. The use of distilled liquors, such as rum, might be more freely tolerated : drunkenness is the first luxury of the savage, the primary motive of his voluntary industry, the earliest temptation to exchange labour for recompense by compact. The use of strong drugs, however unwholesome to the refined and delicate constitutions of the civilized, appears, in the ruder stages of society, to be necessary to the very evolution of the faculties. If an habitual want of rum, of tobacco, or of other similar objects of consumption, can once be superinduced generally on the negroes, every thing necessary to fit them for free labourers is accomplished. Their idolence can then be overcome by other motives than pain and fear. Proprietors might favour the acquisition of wants by their slaves, as well by providing shops of supply, as by allowing recompenses, or partial wages, to such as work over-hours. The suppression of importation, or the abolition of the slave-trade, in the fully settled islands, would almost immedi-

ately convert the slaves, or churls, into vassals; and the allowance of certain days, or half days, in which to work for themselves, as is practised in the Spanish islands, would gradually modify the more orderly and industrious part of the vassal population into free labourers. The process, which is to convert slaves into peasants, has in early ages been tried in all the countries of northern Europe. It ought to be already going on in the West Indies; and it ought to be more speedily applied to the islands, which are most advanced in the progress of cultivation, than to the newer settlements.

Mr. Brougham, however, is not unwilling to make some reforms. He considers as the greatest evil of the West Indian system, the oppressive treatment of the negro-slaves. He objects to the large proportion which the imported bears to the whole black population. He finally assents to the abolition of the slave-trade. The merit of his book consists in a certain ubiquity of attention; in viewing on every side and in all its bearings, the consequences of the measure, and in the art of masking the prejudices of the heart in the frigid forms of calculating policy. He seems aware that there are governments which dare not make their subjects happier, unless it be proved that philanthropy is no per centage on profit, and justice but the titular appellation of prudence.

The title of these volumes is too comprehensive: not colonial policy in general, but only that of the West Indies has been enquired into: perhaps two more volumes are in preparation, to examine colonial policy in the east. There is a something disappointing in the puny concluding result. After visiting the whole archipelago of sugar-islands, and marshalling disquisition after disquisition concerning their circumstances, what do we learn?—*that it would be rational to abolish the slave-trade.*

A very important branch of colonial policy, which at this time it was peculiarly important to discuss, is the theory of colonial taxation. To us it appears very reasonable that, whenever lands are granted to settlers in ceded or conquered territories, the government should reserve a quit-rent—a certain annual tribute from the land, to be valued afresh every fourteen years, and to increase with the progress of private ren-

tal. Some retribution for the original advance of capital, and for the continual charge of protection, is justly due; and this ought to be commensurate with the improvement of value deriving from such successive advances and such successive protections. A land-tax, then, fluctuating with the rent, is the natural recompense, or rather indemnity, of the metropolitan country.

How can this land-tax be introduced? The proprietors will object. They can arm their vassals; and with the help of the climate tire out our troops. They can transfer their allegiance to the president of the United States, and benefit their commerce by breaking loose from the restraints of monopoly. Here appears the want of a middle order of settled tradesmen in the islands. Such a class would long ago have grown up, but for the commercial monopoly. American and other settlers would have had their shops, their banks, their warehouses, their distilleries, their refineries, in every island. These clad classes of the people would have demanded far more British produce, than the naked slaves of the feudal proprietors. These tradesmen would have employed their acquisitions in the purchase of lands, which would thus have risen in value, and have been subdivided into more lots. A large body of small proprietors is more easily subjected to a land-tax, than a small body of large proprietors: division is surer and individual power feeblener. Break up then the commercial monopoly.

It is probable that if the money levied were obviously to be expended within the island, and were to increase circulation without withdrawing property, many persons would, with little reluctance, incur the levy. If it came in the form of a commutation, of a land-tax in lieu of certain burdens on the commerce about to be withdrawn, this would further diminish the hostility. And if it were made the pledge of the security of West Indian property itself—the reluctance might possibly change into approbation. Minors, and other West Indians, widows, and the like, have money in the English funds. What if the dividends on such properties were made payable at certain government-banks in some one, or in all the islands: the new land-tax being payable to, and the dividends on vested capital payable from, these banks. For the balance only the

bank and government might account. The fluctuation of English stock would then never affect the people of the islands, and the facility of making a stable provision of income would increase the spirit of frugality there. The frugal are a stationary population always. The different forms and orders of English society would grow up; and the influence of the observation of civi-

lized gentlemen, not engaged in the cultivation of the soil, would abolish the present effect of reciprocal countenance in perpetuating the ill-usage of the negroes. All things would mend.

Begin by abolishing the commercial restrictions, which is a justice we owe; and we shall receive justice in our turn, by a voluntary submission of the West Indians to a land-tax.

ART. XXVIII. *Remarks on the late War in Saint Domingo.* By COLONEL CHALMERS, late Inspector-General of Colonial Troops in Saint Domingo. 8vo. pp. 115.

THE whole attempt on Saint Domingo was impolitic; to rescue it from the French was to close a constant drain of their troops and their treasures; and to interrupt an interesting experiment on negro emancipation, as ruinous to the enemy, as it was instructive to ourselves.

“From the ill-fated hour of our occupying Port au Prince, our affairs began to decline, in proportion, as it were, to the vast accumulation of expence, and all was languor, disease, or pecculation. Tiberoon and Leogane, Jean Rabel, La Petite Riviere, and L’Arribonite, were re-occupied by the republicans; and St. Mark was nearly lost by the treachery of the men of colour, to whom the gallant Captain Brisbane unguardedly had given his confidence, though extremely offensive to the loyalists of that quarter, who, aided by forty or fifty British convalescents, bravely retook the place from Toussaint; an additional proof, that the offensive operations of this boasted chief were impotent; and his shameful repulse about this time before La Verrete, one of the central posts of the cordon of L’Archaye, is no mean confirmation of this assertion.

“Posterity will scarcely believe, that considerably more than two millions sterling were annually expended in Saint Domingo after the possession of Port au Prince; and will lament the infatuation of the times, when informed that the Mole and the entire Peninsula of Tiberoon might have been tranquilly secured for one third of that sum.

“About seven thousand troops sailed in November, 1795, from Cork; and, experiencing those repeatedly terrible gales so destructive to Admiral Christian’s convoy, they were obliged to return to that place; from which, in February, 1796, they again sailed, and arrived at the Mole in May, under the command of Brigadier Howe. This place, indeed, was very ill-adapted to restore troops after such a disastrous passage; and a dreadful mortality immediately ensued\*.

“If Mr. Edwards had possessed candour,

or information, he would have acknowledged, that those and almost all the troops sent to Saint Domingo were indifferently composed; arrived unseasonably; perished almost immediately; and on service were directed with little ability; he would have acknowledged these, and disregard to oeconomy, as the causes of the failure in Saint Domingo, and not the republican force, which was ever contemptible; nor the lukewarm attachment of the royalist planters, for those maintained their loyalty even after their hopes were almost destroyed by our inconsistency.

“General Williamson was succeeded in command by Major General Forbes, a brave and worthy officer, enthusiastically disposed by every means in his power to promote his Majesty’s service. He strengthened the cordon from the Cul de Sac to Saint Mark, and established the frontier post of Miraballais and Banica, to preserve the communication with Spanish Saint Domingo, necessary for procuring cattle. He took eight or nine hundred Spanish inhabitants into British pay; and those, with a body of Colonials and a few other troops, garrisoned Banica, commanded by an officer of merit, Lieutenant Colonel Sir William Cockburn. This place promised important future advantages by its easy access to the rich plains and town of Cape Francois, which is open on the land side, and commanded by high mountains, and most undoubtedly at the mercy of the garrison of Banica, if reinforced by one thousand steady British infantry. But, in justice to General Forbes, it must be admitted, that, from the infelicity of the times, and the causes already suggested, the troops at his disposal were not such as those commanded by General Wolfe.”

Future historians of the anti-jacobin war, will derive, from this pamphlet, many similar corrections of the prevailing ideas concerning this unfortunate campaign, which ingloriously sacrificed to pestilence a force that might have occupied Louisiana, and liberated Mexico.

\* As if to seal the destruction of the said troops, they were, it seems, detained some weeks on board the transports in the harbour of the Mole, previous to their being disembarked.

ART. XXIX. *A Letter from Barbadoes on Manumission*, 8vo.

THE expediency of provisions for liberation from slavery, where slavery exists, has been found in all ages. Manumission operates as an incentive to good deeds: it is a mean by which fidelity may be recompensed, service remunerated, industry indemnified, and affection acknowledged. The Hebrews, the Greeks, the Romans, had accordingly their several forms of redemption; the English have connived at the introduction of a form of manumission, by declaration to that effect before the Lord Mayor of London.

This writer (page 16) disputes the validity of such London manumissions; and maintains, that in the West Indies some dispensers of justice would attend to them, but that others would not.

The uncertainty of the law is itself a sufficient grievance, to justify, or rather to call for parliamentary interference. It is obviously desirable, that some form

of manumission should be devised, common both to the islands and to the mother country, and capable of being legally executed in the presence or absence of the parties.

We recommend to fix a specific and a narrow price, at which every negro should have a right to demand and exact his freedom. The receipt for that amount, from his master, would then at all times be a proper proof of manumission.

The Romans conducted a slave to the temple of the goddess Feronia, and there put him on a worsted cap. This was their form of manumission, and hence the cap of liberty. It is more in the spirit of our legislation, to be less emblematic, and more calculating. Suppose there be a stamp duty on manumission, and the cap of liberty engraven on the die.

ART. XXX. *Substance of the Speech of the Honourable C. J. Fox, in the House of Commons, May 24, 1803.* 8vo. pp. 129.

COULD the manner of Demosthenes be copied, says Hume, its success would be infallible over a modern assembly. It is rapid harmony, exactly adjusted to the sense; it is vehement reasoning, without any appearance of art; it is disdain, anger, boldness, freedom, involved in a continual stream of argument. Of all human productions, the orations of Demosthenes present to us the models which approach the nearest to perfection.

Two thousand years have elapsed since these speeches were pronounced at Athens, and the whole surface of the earth has as yet produced but one rival to Demosthenes. How fortunate the country which possesses, how blind the country, which possesses in vain so rare an evolution of human intellect. Mr. Fox is not inferior to his Greek model in the highest departments of art, in exhaustive argument, or in vehement, pathetic, soul-enkindling expression; he displays more humour, when he condescends to the ridiculous, and, at all times, a greater command of critical allusion.

Since the admirable speech on the Russian armament, Mr. Fox has not perhaps executed a superior piece of oratory to the present, for comprehension of view, for sagacity of inference, for patriotism of advice, and for the adaptation of its

temper to its aim. This statesman-philosopher, like the Olympian Jove, seems to look down, from his unclouded dwelling, on the mad strife of men with heartfelt pity; his benevolent wisdom estimates already the mischievous result with prospective equity, and commissions Pallas to seize the warriors by the hair:—"hearken in time, ye kings, or Nemesis, the goddess of retribution, will arrive to punish your heedlessness."

What has in fact irritated this country most of any thing against Bonaparte, is the arrogance, the contemptuous tone toward us, ascribed to him. This charge is happily got rid of.

"The charges of arrogance, and of a superiority assumed by the First Consul in his language towards this country, are further urged and supported on the testimony of his conversations with Lord Whitworth, to which allusions had been so frequently made: those conversations are said to have been not only offensive in their tone, but in their substance. Mr. Fox could see no foundation for this species of charge in the long conversation with Lord Whitworth, on which so much stress had been laid, and some expressions of which had been so triumphantly quoted.—What was the report of those expressions, as given by Lord Whitworth himself? Does the First Consul say haughtily to him, 'I will come and crush you—*Je vous écraserai*?' Just the reverse. He tells us plainly and di-

rectly indeed, that he shall attempt to invade us; but he says also, that he knows the chances are one hundred, to one against his success; that it is one hundred to one that he and the greatest part of the expedition would go to the bottom of the sea. He talked much, and with great earnestness, on this subject, but never once affected to diminish the danger. Yet this declaration of the First Consul, of the almost utter hopelessness of any enterprize he might attempt against us, is quoted as a proof of his arrogance and presumption! 'Whatever else there may be in it,' said Mr. Fox, 'there certainly is in this conversation no tone of superiority; on the contrary, it is an acknowledgment of superiority on our side. To call it arrogant or presumptuous, or to say that it is offensive in its tone, or in its substance, appears to me a very whimsical imputation. It reminds me of the most extravagant passage that is, I believe, to be found in a great, and, with me, most favourite poet, and who, notwithstanding the frequent instances of the same sort which occur in his works, is one of the finest in our language, I mean Dryden, who, in the most extravagant perhaps of his pieces, and into the mouth of Almanzor, puts a sentiment which has always appeared to me to outsoar every flight allowable to the wildest fictions of the imagination. In the conquest of Grenada, his hero, who is burlesqued in the *Rehearsal*, under the character of Drawcansir, says, in anger to his rival:

'Thou shalt not wish her thine; thou shalt  
'not dare  
'To be so impudent as to despair!'

"Now I confess, notwithstanding what I may have thought of the extravagance of my favourite poet, that I had over-rated it. I had thought that no case could happen to give common sense to those expressions, and make them applicable to real life. I thought them the daring efforts of a vivid genius, aiming at the summit of poetical hyperbole; but now I find that Dryden gave only a tame prosaic account of a matter of fact, a few years before it happened! He says, 'You shall not wish, you shall not dare, to be so

impudent as to despair!' Bonaparte says, he despairs of success in his invasion of England, and, for his pride and impudence in despairing, as well as for his presumption in telling them so, ministers think no punishment too great. Now I profess myself to be one of those who agree in this respect with the First Consul, and who think that in his despair there is infinitely more good sense than arrogance. I think it is full one hundred to one that he and the greater part of his expedition would go to the bottom of the sea, if he should attempt a descent on our coast. I certainly think this, and I am very glad to find that Bonaparte is of the same opinion."

It is not often, that a proposition of such extent and consequence as Mr. Fox on this occasion opened to the house, brought forward under circumstances so unpropitious to parliamentary union, has been distinguished by so universal a concurrence of public sentiment. To himself personally the result of that day must be presumed to have been highly gratifying. Added to the satisfaction of success, he could not be insensible to the general voice of parliament and of his country, nor to the favourable opinion of a great man, not very ready on other occasions to assist his exertions; or to do justice to his public conduct.

That day also will form, should Europe providentially escape from its present danger, a very interesting epoch in its annals. If a balance to the continental power of France is ever to be recovered, it must be recovered through the operation of the principles contained in Mr. Fox's proposal, and through that only. If the smaller states of Europe are to enjoy any portion of independence, they must look for it in the system sketched out by his speech, and in that system only.

ART. XXXI. *Substance of the Speech of the Right Honourable HENRY ADDINGTON, on Friday, December 10, 1802.* 8vo. pp. 35.

MR. Addington is the avowed copy of Mr. Pitt: the likeness is real, but it is not a flattering one; both are more adapted for the department of finance than of statesmanship; and harangue better with the figures of the arithmetician, than of the rhetorician.

During war, it is expedient for the Chancellor of the Exchequer to make his statements of actual revenue at the highest, to infer his average produce of the year from those months which are

most productive, and to wind up his accounts at the period when the tide of revenue is at flood. This favours an opinion of the stability of funded property, and of the national power to discharge the interest of further loans. It consequently induces men to place money in the stocks; and, by keeping up their price, enables the state to borrow so much the cheaper.

But, during peace, when the state is in a train of paying, not of borrowing, it

becomes expedient for a Chancellor of the Exchequer to make his statements of actual revenue at the lowest, to deduce his average produce of the year from the unprofitable months or quarters, and to bring out his documents when the tide of revenue is at ebb. This favours alarm among the stock-holders, depreciates funded property; and by enabling the commissioners to make their purchases in the different stocks at the lowest possible rate, accelerates the extinction of the national debt.

This speech was made during peace; and Mr. Addington has not shown himself aware of the propriety of this inversion of former policy. He follows a precedent when he should set an example; he hangs out the old show-board, and gilds the figures he should blacken.

A passage, which may retain some interest, we shall select.

“ It was not possible till the conclusion of the year (when all these accounts were made up) that they could be laid regularly before the house, or stated with exactness. Great pains had however been taken to procure the most accurate and complete information which the period of the year admitted, and he thought himself justified, by what had been obtained, in pronouncing the commerce of the country to be in a state of unrivalled and unexampled prosperity. It appeared that the real value of the principal articles of British produce and manufactures exported during the year ending 10th of October, 1802, was 27,900,000*l.* while in the preceding year it was something less than 24,500,000*l.* Supposing these articles to bear the same proportion to the whole of our exports which they had done in former years,

the total value of British manufactures exported in the year 1802, would not fall short of 50,000,000*l.* sterling, being an increase of 8,000,000*l.* above the year preceding; and compared with any former year, the increase would be still more extraordinary.

“ The accounts of shipping were more imperfect than those of trade, as no quarterly account was made up, except in the port of London; but so far as the fact could be ascertained, it was no less satisfactory, especially with regard to the important circumstance of the increase of British shipping and seamen.

“ In the year ending the 10th of October 1801, 1762 British ships, measuring 418,631 tons, and manned with 23,096 men, had entered that port, and 1331 ships, measuring 350,634 tons, and carrying 24,070 men, had cleared outwards. In the year 1802, the British ships which entered inwards were 2459, the tonnage 574,700, the men 33,743. The British ships which cleared outwards were 1933, the tonnage 419,067, the men 23,112. The diminution of foreign shipping was not less remarkable than the increase of British. In 1801, the number of foreign ships which entered inwards was 3385, their tonnage 452,677, their men 20,388. The foreign ships which cleared outwards were 3381, their tonnage 445,651, the men 23,302. In the year 1802, the number of foreign ships entering inwards was reduced to 1549, their tonnage 214,117, the men 10,555. The foreign ships which cleared outwards were 1808, their tonnage 262,006, the men 14,826. These details he feared might be tedious, but he was persuaded the committee would excuse him for having entered with minuteness into the proofs of the increase of our commerce and maritime strength, which were the great sources of our prosperity and of our power.”

ART. XXXII. *The Speech of the Earl of MOIRA, delivered in the House of Peers on Wednesday the 9th of March, 1803, on the present Situation of Public Affairs.* 8vo. pp. 14.

THIS animated and lofty eloquence of the Earl of Moira, called forth by the critical situation of public affairs on the eve of the present war, was admirably calculated to rouse the energies of Britons; he conceals not the dangers of the conflict, but he prepares us to encounter them like men, who fight ‘for their property, for their hearths, for every thing that is dear to sons, to fathers, and to husbands: for their honour, their liberties, and all the cordial relations of social life.’ The noble earl prepares us

for an attempt on our country: the extent of coast possessed by our enemy renders an invasion not impracticable; but though he anticipates the desperate enterprise, he estimates the character of Englishmen too highly, to hold forth the possible subjugation of the country, as an object of the remotest apprehension.

We are truly glad to see such speeches as this committed to the press: they do honour to the orator, they keep alive the noble ardour of the people, and they are not read with indifference on the continent.

ART. XXXIII. *The Substance of a Speech intended to have been spoken in the House of Lords, Nov. 22, 1803. By R. WATSON, Lord Bishop of Llandaff.* 8vo. pp. 46.

THE short administration of the marquis of Lansdowne was distinguished by a wise selection of the objects of promotion: but a preference of candidates for advancement, recommended only by their merit, to those supported by *parliamentary connexion*, is but too sure to combine against a minister the constituted authorities. The elevation of the bishop of Llandaff was among the benefits conferred on Great Britain, by that short, but truly patriotic administration.

The speech before us contains three distinct propositions, not equally within the province of this venerable prelate. First occurs a proposal for a rotatory militia, for training all the young men of the country, who have passed their seventeenth year, to the use of arms during six successive years. This is not an impracticable, nor an absurd plan: the military exercises promote health, bestow grace, afford amusement, and liberalize the manners. They tend to break down the barriers of rank and the arrogance of inequality, to open the gates of advancement to spirit, and to unite a whole nation in a brotherhood of feeling and affection. But they also tend to introduce an earlier libertinism: and thus to increase the proportion of prostitution, of bastardy, and of the undomesticated, uneducated, and improvident poor. Early libertinism in the numerous classes is accompanied with heavier demands on the pocket, than the wages of incipient skill can usually supply: the temptations to pecuniary improbity are thus increased. In a commercial country this is a very alarming consideration: the exchange of honesty for honour among the industrious classes, is utter ruin. Impatience of confinement is probably another consequence of military habits, not very desirable in a mercantile nation; so that there is reason to pause before the usual division of labour is abolished, and the whole mass of our youth is barbarized into a soldiery. The bishop will not disapprove our discussing the morality of his project.

Secondly occurs a proposal for the payment of the national debt; but as the means of accomplishing this magnificent scheme are veiled in obscurity, we can neither admire the ingenuity, nor

dispute the practicability of the plan. There is a figure of rhetoric, which the French call a *Gasconade*, and which the English might denominate a *Welshism*, under which it seems most rational to class the eloquent passages relative to this expensive enterprize.

Thirdly occurs a proposal for the establishment of popery, and the extension to all dissenters of eligibility to office. Here the bishop is at home; he argues with a candour, a liberality, and an earnestness worthy of his generous cause.

“One circumstance in the situation of Ireland has always appeared to me an hardship, and that hardship still remains undiminished. I have always thought it an hardship, that a great majority of the Irish people should be obliged, at their own expence, to provide religious teachers for themselves and their families. I have the copy of a letter, in my possession, to the duke of Rutland when lord lieutenant of Ireland, in which I pressed upon his consideration, the propriety of making a provision for the catholic bishops and clergy in that country; and I have been assured by men, well acquainted with the temper of the Irish, that had such a measure been then judiciously adopted, a rebellion would have been avoided, and Ireland would long ago have been tranquillized. Whether the time for trying such a mean of tranquillization be now so passed that it cannot be recalled, I know not; but whether it be so passed or not, the measure itself, being founded in justice, is not unworthy the consideration of government. I love, my lords, to have politics, on all occasions, founded on substantial justice, and never on apparent temporary expedience, in violation of justice; and it does appear to me to be just,—That the religious teachers of a large majority of a state should be maintained at the public expence.

“If you would make men good subjects, deal gently with their errors; give them time to get rid of their prejudices; and especially take care to leave them no just ground for complaint. Men may for a time be inflamed by passion, or may mistake their pertinacity for a virtue, or may be misled by bad associates; but leave them no just ground of complaint, and their aberrations from rectitude of public conduct will never be lasting; truth and justice, though occasionally obstructed in their progress, never fail at length to produce their proper effect.

“Justice, I think, may be done to the catholics, without injustice being done to the protestants.—The protestant clergy may continue to possess the tithes of the country;

and the catholic clergy may be provided for from the public exchequer of the empire. I see no danger which would arise to the established church from some such arrangement as this; and it would, probably, be attended with the greatest advantage to the state. We think the catholics to be in an error; they think the same of us; both ought to reflect that, every error is not a criminal error, and that their error is the greatest, who most err against christian charity.

“If any one should contend that this is not the time for government to make concessions to Ireland,—I wish him to consider whether there is any time in which it is improper for either individuals or nations to do justice, any season improper for extinguishing animosity, any occasion more suitable than the present, for putting an end to heart-burnings and internal discontent. I should be as averse as any man from making concessions to an enemy invading the country; but I would do much to gain a cordial friend to assist me in driving him back;—and such a friend, I am confident, Ireland will become.

“I come to the last point—the case of the dissenters.—I am well aware that on this point I differ in opinion from men whom I esteem; but without arrogating to myself, without allowing to others, any infallibility of judgment, I am anxious, in this crisis of our fate, to speak my whole mind. What I presume to recommend is—A repeal of the test and corporation acts—as a mean of combining together, in the cords of mutual amity and confidence, the whole strength and spirit of the country. It has been said that the dissenters constitute above a fifth part of the population of the kingdom; I do not think them to be so numerous; but I am convinced that they are too loyal to be treated with distrust at any time, and too numerous to be soured by neglect at this time. I am far from insinuating that the dissenters want to be bribed to their duty by the repeal of the test act; no, my lords, churchmen and dissenters of every denomination, are equally zealous in the common cause—they seem to me to emulate the patriotism of the patricians and plebeians at Rome; who, for 500 years, waged an eternal war of words about their respective rights, claims, oppressions, privi-

leges;—but when their country was in danger, when an enemy invaded their territory, they laid aside their disputes; their only contention then was, which of them could show the greatest courage in repulsing the enemy of them both.

“I have never had any design, any wish, my lords, to gain the good-will of the dissenters, by becoming a champion in their cause—much less have I any inclination to provoke the ill-will of churchmen, and the disesteem of my brethren, by a forward display, or a forward retention, of an opinion opposite to theirs. I may be wrong in thinking that the repeal of the test act would in no degree endanger the safety of either the church or state; but whilst I do think so, I should act a timid, interested, dishonourable part, if I concealed my sentiments.

“I will mention to your lordships an anecdote respecting this matter; for the truth of which I pledge my honour, and, in doing that I hope I may be permitted to expect full credit from the house. When the dissenters, a second time, petitioned parliament for the repeal of the test act, I called, accidentally, upon Lord Camden, then president of the council; and, in the course of conversation, asked him this plain question, suggested by the alarm which had been taken by some churchmen—‘Does your lordship see any danger to the church of England from the repeal of the test act?’—He answered, with an eagerness peculiar to himself when his mind was determined—‘None whatever.’—If then I err in this matter, I err with the late lord Camden; and though I had not rather err with him, than be right with others, yet I neither wish for, nor know where to find, a better supporter of my sentiment.”

May language like this soon become the universal voice of a church, too long a preceptress of intolerance; too recently, against the catholics of Ireland, a sanguinary persecutress. The mild precepts of a humanizing religion will, in time, pervade the remotest precincts of her influence, and found on civil concord the new strength of the empire.

ART. XXXIV. *Reflections on the Causes of the present Rupture with France.* 8vo.

THAT weighty and serious grievances and complaints have been advanced and discussed in the official correspondence between this country and France, admits of no doubt; but, as a grievance redressed, or a complaint withdrawn, is not only no ground of enmity, but rather of confidence, because it displays a desire of quiet, it becomes necessary,

in order to prove the justice or justifiableness of the British declaration of war, to show that the grievances alleged were wilfully overlooked, that the arrogant claims were obstinately persisted in. To most persons who read the official correspondence, it is matter of surprize that it should have led to war, or terminated in it.

First one hears about the Fame packet detained in December 1801, and confiscated. Mr. Adolphus well defends the justness of our complaint; but ministers chose to let the matter drop. As a ground of war it probably appeared to them trifling; it was in one respect inexpedient, for a cry of maritime arrogance and tyranny is easily raised on the continent against Great Britain, and the public opinion and commercial opinion of the continent greatly affect our obtaining allies there; so that it is always desirable to hinge a war on some interest, in which the continental public is likely to sympathize. If this confiscation, and another which followed, did not occasion a war early in 1802, it cannot be pleaded in excuse for the declaration of war in 1803.

Mr. Adolphus next examines the protection afforded to the emigrants. Here again he convincingly shews that the conduct of the English ministry, in refusing to comply with the demands of France, was becoming. The French seem to have thought so themselves; they only bring it forward to retaliate our captiousness about the pretender, and presently they drop the ground of complaint altogether. Are we to go to war with them, because they are satisfied with our conduct?

The freedom used in some publications, in descanting on the government and rulers of France, is then considered. It appears to have escaped the attention of our ministers, although observed to them by Lord Whitworth, in his letter from Paris of the 27th January, 1803, (*Offic. Corr.* No. 35), that this complaint originated with Talleyrand himself. Who that has read the American transactions to X Y and Z, can misunderstand this? It was a ground of complaint which it depended on the agents of Great Britain to intercept from the ears of the first consul. They had only to fee an officious translator to be idle; and no wind from England would have had the force to blow enmity and hatred quite home to St. Cloud.

Some impertinencies of the French press are produced and censured by our author: but as neither party accompanied the expression of their wishes, on this subject, with the slightest hints of threat, in case of non-compliance, it is preposterous to talk of the liberty of the press as any ground of war at all between them.

The question of Malta busies our author at considerable length: the tenth article of the treaty of Amiens, which respects that island, was become incapable of strict execution; but it has been so nearly complied with on the part of the French, that to retain it would, in a case of private life, be called quibbling and chicanery.

The memoirs of Sebastiani, of Rheinhardt, take their turn; they are cases of the liberty of the press; they are disavowed in a manner which, if it does not satisfy, gives satisfaction.

The disposition to assist the Swiss friends of liberty was thus far a duty in the British government, that on former occasions the antijacobin ministry were supposed to have patronized the opposite cause, and to have put money at the disposal of Steiguer and his adherents, the ascendancy of whose unpopular party was the provocation which induced the Swiss to throw themselves into the hands of France. These Alpine disturbances might have been made into honourable grounds of war; but as the geographical situation of Switzerland prevents any efficacious assistance from this country, it was most humane not to inflame an ineffectual resistance.

Something of the same kind might be alleged against interfering, at present, in the affairs of Holland. Without the prospect of Prussian co-operation, there is little chance of Dutch liberation. The conduct of the French in Holland justifies, however, much stronger remonstrances than any which were presented by our ministers. If they chose to go to war, this was the most important interest of the nation involved in the discussion, and should have been selected as the fulcrum of indignation. It would, however, have been better not to choose to go to war; but to have laid before parliament the official correspondence, without the previous recal of Lord Whitworth, or without any aggressive declaration. The public opinion of Europe would have been influenced by the debate; it would have rung with the applause of Mr. Fox, then again, as in the case of the Russian armament, the hope and bulwark of Europe, of the world, against needless devastation. Towards obedience to the voice of equity, temper, and wisdom, both parties would somewhat have bended; they would have been urged so to do by the writers

of that higher class, to whose voice senates listen, and even generals of armies. And thus the country would pro-

bably have escaped the calamity of a new contest.

ART. XXXV. *An Appeal to the People of the United Kingdoms against the insatiable Ambition of Bonaparte.* 8vo. pp. 260.

THIS is one of those zealous pamphlets, which, like a fire of fir-cones, torches and blazes much, and warms but little. Its object is to recommend the war to popularity: this is difficult; ministers have so mismanaged the negotiation, that their best reason of war, the non-evacuation of Holland, is flung into the back-ground, and scarcely makes its appearance in the official correspondence. One cannot then be loud about the justice of the war: neither can one be loud about its prudence. Russia and Prussia may join us, and we may march to Paris; but the probability of such a junction, when the war began, was very inconsiderable. There remains a ground of fanaticism: a wise minister would recur to it. It would marshal around the constitutional throne, a support more popular, more vehement, more permanent, than any war of this reign has yet obtained. It would attract, by the force of sympathetic feeling, the support of the independent talent, of the unbought genius of the country. It would secure at once the secret, and soon the public, voice of continental Europe. It would divide France into mighty parties, and probably hurl the usurper from his throne. This ground of fanaticism is to proclaim a war in behalf of the suspended popular authorities of the French; a crusade for the restoration of liberty and equality.

Since the beginning of the anti-jacobin war, the interior situation of France is reversed. The French were then pulling down their monarchy, their church, their nobility; and they were patronizing the concatenation of democratic clubs, in order, by their means, not merely to disseminate and popularize, but to influence and overawe the volitions and decisions of their legislature. Loud impertinent attacks resounded from the French senate of those institutions in other countries, most analogous to the establishments they were subverting at home. In order to excite here the greatest possible antipathy to such proceedings, it was natural for Burke and Barruel to seek out, in the writings of

their jesuitic teachers, for those arguments and war-whoops, which had, of old, inspired and accompanied an excessive and prejudicial value for church and king, or (if the abstract be preferred to the concrete expression) for religion and order. But now that Bonaparte has restored popery in its ancient integrity, and monarchy (or the government of one) in his own person; these arguments all tend to stabilitate his institutions, to render popular his government, and to facilitate the progress of his authority from a life-long to an hereditary, from an anonymous to a titled sway.

Bonaparte, at every period of his being, was personally an antijacobin: officers and generals had scrupled to bid the soldiery fire on the people; his first step to promotion was the use of cannon and grape-shot against the multitude in the very streets of Paris. This massacre of the jacobins took place at the time of the insurrection of the sections against the directory; and was so bitterly resented in the suburb of Saint Antoine, that vows were made for the extinction of the commanding officer, and reliques of the slaughtered were worn by women in their bosoms as a spur to vengeance. Bonaparte withdrew to the south of France; then got sent to Italy, where the manifestoes of Berthier (for Bonaparte can no more spell than Marlborough) got him the unmerited reputation of a friend to democracy and liberty. His earliest measures of power were to chace, with the bayonet, from their hall the representatives of the people; and to disperse all sorts of popular assemblages and confederacies. To satirize affiliated societies has passed for the panegyric of his usurpation. His religiosity was already apparent at the obsequies of Pius VI, and probably recommended him to the critical preference of Sieyès. He banishes, at will, members of the old directory, or of the new tribunate; he governs by a sort of martial law, mildly if he can, but, howsoever, he governs. The admiration of a government, flourishing and success-

ful, unchecked in its operations, and seeming, therefore, to compass its objects more speedily and effectually, has gained something upon all ranks of people. It is for the good patriots of this day to struggle against it; to discourage all needless and useless intercourse with France; and to encourage an alienation from its councils and its example. The vicinity of the two countries remains, and must remain; and the natural mental habits of mankind are such, that the present distemper of France is far more likely to be contagious and permanent, than the old one. It is not easy to spread a passion for liberty among the people, that requires principle, self-denial, exertion, disinterest, instruction, humanity, patience, perseverance, justice. But in all evils of the opposite kind our natural inclinations are flattered: to obey, accommodates the indolence, to corrupt and be corrupted the avarice and ambition of men. We are now once more, as were our ancestors, in danger of being entangled, by the example of France, in the net of an hypocritical and relentless despotism.

It is expedient then, as well for the preservation of our own as for the revival of continental liberty, that the eloquence of her most strenuous defenders should once more resound through Europe, from within her only remaining sanctuary, the British house of commons. How else shall the accents of freedom travel on every wind, and reach the cabinets of philosophy, and the reading rooms of patriotism? How else shall those tame fickle Parisians be aroused to a sense of their deep degradation and their mean submission? how else shall those sublimely proud Marseillaise be provoked to revenge or follow the founders of popular enfranchisement? how else shall the Genevans be reminded, that the limits of France extend beyond the bounds which despotism had fitted to receive a conqueror with joy? how else shall maimed, trampled, fettered, insulted Switzerland be taught that independence is not only a blessing, but a virtue?

Deeply as the country has now to regret Mr. Burke's having condescended to lend his unequalled talents for producing an innovation of national opinion, a base desertion of the hereditary, tried, and liberal principles of our forefathers, in order to provoke us to wage, with peculiar animosity, an anomalous

and imprudent war; it is clearly become expedient henceforth, in every possible form, to obliterate the impression of his numerous arguments, and of his yet more momentous diction. *Gallos quoque in bello floruisse* we have both heard and felt. The ancient boundaries of France are blotted from the map of Europe, and we now have almost a doubled population to encounter. We are still not to despair; but to look with some confidence to those principles which aggrandized free France, as the means of diminishing despotic France.

The country now wants the exiles of its own intolerance, to shout in the slack ear of France the daring declamations of their noble enthusiasm. The emulous eloquence of representative freedom is there forbidden. The speeches of Languinais are imprisoned within the echoes of the Luxembourg. Carnot is returned from men to mathematics. Daunon and Isnard are compelled to preserve an indignant silence. The hireling flatterers of power alone may climb the pulpits of their constituted lecture-rooms; only the panegyrists of office may spout diatribes on legislation. For the lessons of liberty to reach Paris, the parliament of London must discuss the rights of man. Newspapers will do the rest. It will be fancied that to give a loose here to such a cast of opinions, to corroborate them with the support of the executive power, and with the authority of an applauding house of commons, might weigh down the lighter, the popular scale, and alter the present balance of the constitution. Why so? Has it not formerly for more than half a century tried and sanctioned them uninjured? The constitution is very strong. If the weight of Burke did not make it a despotism, who shall aspire to make it a republic?

In discussing the means of internally annoying France, all rational inference must terminate in recommending to our statesmen, an affectedly jacobinical tone of declamation. The jacobins are the discontented at Paris; their opinions alone are adapted to produce mutation. A hacknied clamouring for religion and order will not abrade the popularity, or weaken the energies of a French government, orderly as an apprehensive garrison, and religious as converted courtesan.

These means are also most conducive to the external annoyance of France.

Without the aid of Prussia, Holland cannot be snatched from French supremacy. What is the road to Prussian favour? Certainly not antijacobin principles, or an antijacobin embassy. The king may be very moral, frugal, and domestic; may read Antoninus's meditations, and pension the novelist La-fontaine; but he has not the passion of personal meddling. An official body corporate, formed in the school of Frederick and prince Henry, attached to no superstition, and not satisfied with the recent French precedent of enthroning a general and establishing popery, is the ruling power. It can never sympathize with aristocratic opinions, which threaten the revival of the states (Landstände) in its half-mastered provinces. In short, as far as opinion (but all is not gold that tinkles) can effectually predispose a literary metropolis and a philosophic ministry to co-operation with the rulers of this country, the low principles, as we call them here, are best adapted.

In Russia, the nobility are said to incline to the high principles, and the monarch, a pupil of Laharpe's, to the low. His sensibility to praise is his loveliest foible: he pursues the applause of the enthusiasts of reform. There is nothing to be done in the tyrannizing line in Russia; no habeas corpus acts to suspend; no martial laws to contrive; such things would not excite a stare. A czar, to be original, must be the improver of agriculture, the liberator of the peasantry; he must correspond with Mackintosh on the laws of nations; and watch the speeches of Fox for a compliment: and this is the elegant taste of Alexander. He values, and justly values, higher the praise of London than the praise of Paris: it is less rash, but more lasting; it is not immense, but it mostly fits. A forwarder co-operation of the Russian court would clearly have resulted from earlier, and less equivocal, approaches, on the part of our government, to the advocates and friends of liberty.

We are threatened by, or are threatening, a war with Spain. Without the alliance of the American states, there is

little chance of approaching Mexico, of obtaining the isthmus to cut a canal into the Pacific, or of securing independence to Peru and Chili. And what is the road to American co-operation?—Again the principles of liberty, in their rashest nakedness, and loudest shouting enthusiasm. What has hitherto prevented a strict alliance from setting in between us? Merely, that while the one country promotes its whigs, the other promotes its tories. A Jefferson has to negotiate with a Grenville. Were our ministers in the principles of the American ministers, (we *can* change, they *must* abide by the incoercible result of popular suffrage), our treaties of commerce would be settled without chicanery, and would lead to treaties defensive and offensive.

In short, whatever purposes are to be answered of foreign alliance, or continental co-operation, the federative or diplomatic interests of the country imperiously require from our statesmen the profession of eleutherism. Ireland would at once be converted to affection, and allegiance here warm into enthusiasm.

As to the truth or utility to mankind of the liberal school of principles, we have no hope, in this age of meanness, that for such reasons it should be patronized; but we conjure statesmen by their policy, and government by its nationality, to employ their parliamentary and literary sophists in teaching anew the principles of freedom, and in directing the public expenditure and the public force to reversing the mischiefs occasioned by the various tendencies of the late unfortunate and ruinous war. Against the principles of antijacobinism and Bonaparte let sovereigns arm, and they will deserve to triumph.

There is much about Switzerland in this pamphlet: it is the best part of it. Yet, were the doctrines of liberty there to be acted upon, without the certainty of extensive assistance both in Provence and Italy, they could only rivet more closely the yoke of France. The Swiss should await the hour of French adversity.

ART. XXXVI. *The Question, Why do we go to War? temperately discussed according to the Official Correspondence.* 8vo. pp. 30.

THIS is one of the ablest controversial pamphlets in the language: it examines the motives for the late mischief—  
ANN. REV. VOL. II.

ous declaration of war, which ministers have brought out in the official correspondence, and pronounces them all,

when weighed in the balance, to be found wanting.

They consist principally of eight.

"The first, and perhaps the heaviest, respects the confiscation of our merchant ships. In the early part of the last war the French prohibited the importation of English goods and manufactures, which prohibition they did not think proper to take off at the peace. We did not stipulate that they should; they had an undoubted right therefore to make what regulations and restrictions they pleased: it was a blind and pitiful policy, and would have corrected itself, had we let them alone; they would have perceived, in a short time, the reciprocal advantages of a commercial intercourse. We cannot beat them into trading with us, or cannonade them into friendship. If the harshness and severity employed in the execution of the law were matters of complaint and causes of war, it should not only have been represented, as it was indeed, by Mr. Merry, but satisfaction insisted upon before we resigned our long catalogue of conquests: for the affair of the *Fame* packet occurred in December 1801, and that of the brig *George*, where the knives and forks were seized, in August 1802; and in the following December, at the opening of parliament, it was declared there was no reason to doubt of the permanency of the peace. We may presume, therefore, our government was satisfied.

"2. The next relates to the commercial agents or commissaries sent into this country to be stationed at our different sea-ports, by way of consuls over trade, with these instructions among others, viz.

"Instruction 11.—'You are required to furnish a plan of the ports of your district, with a specification of the soundings for mooring vessels.'

"Instruction 12.—'If no plan of the ports can be procured, you are to point out with what wind vessels can come in and go out, and what is the greatest draught of water with which vessels can enter therein deeply laden.'

"Now, not to mention that this information was really necessary in a commercial view merely, or that plans of our ports with soundings may be purchased at any good map-seller's in London; grant that it was meant to be availed of in case of hostilities taking place at any time between the two countries, and that it was highly insidious, it was not matter of such uncommon provocation; and no one, I think, who is acquainted with the various intrigues of the old cabinet of Versailles, will assert that that cabinet, or perhaps any other, would have had the smallest scruple of adopting a similar measure, had opportunity occurred; and an accredited minister or envoy would be deemed very properly alert in his office, who could procure his government such information. But what was done on the occasion? The vigilance of

our administration discovered the instructions, dismissed the commissaries, and France took them back again. Where then is the cause for war?

"3. The third is, desiring us to send away the emigrants, under the idea that they seek to raise disturbances in the interior of France, and to recommend to the Princes of the House of Bourbon to join the head of their family at Warsaw. What do we answer? Why with manliness and humanity, that as long as they behave peaceably towards us, nor plot against them, we will not refuse the hospitable protection they stand so much in need of. They urge it no more. Is there then in this a cause for war?

"4. Fourthly it is stated, we have suffered an indignity by the 'requisition, which the French government has repeatedly urged, that the laws and constitution of this country should be changed, relative to the liberty of the press.' These are the words of the declaration. Let us see what is the complaint and what is the request, and how far it can be said they have required an alteration in our laws and constitution. They complain that ever since the conclusion of the treaty of Amiens, the English press has not ceased to calumniate and revile the French and their government, to represent their republic in the most odious and degrading light, that the people are appealed to against it, and instigated thereby to insurrection and rebellion. They observe, 'that the particular laws and constitution of Great Britain are subordinate to the general principles of the law of nations, that if it be a right in England to allow the most extensive liberty to the press, it is a public right of polished nations, and the bounden duty of governments, to prevent, repress, and punish every attack which might by those means be made against the rights, the interests, and the honor of foreign powers. They retort with justice, that the French writings furnished in England a plausible vindication of the necessity of the last war; and will England now put the same weapon into the hands of the French?' This is all but too true; I believe, universally allowed. All sober-minded Englishmen felt scandalised at the daily abuse, and looked forward in sorrowful presage to the serious mischief it would ultimately occasion: it might and ought to have been corrected. I am as much attached as any man to the liberty of the press; am availing myself of the privilege of it at this moment: but is it wise, is it just in any government, to permit the public tranquillity of the nation to be endangered by the licentiousness of the press, unless the nation chooses thereby to intimate its own dispositions? Was it to be expected that the First Consul should patiently and quietly endure to be so personally abused, and hear the people he commanded perpetually excited to revolt? Was it consistent with the very first article of the treaty of peace? Was it, carefully avoiding every thing which might here-

after affect the union happily re-established between the two nations? Was it possible to maintain that union under such continued irritation? And what was required, or rather what was solicited? Mr. Otto's note (p. 39, Official Correspondence) says, 'the undersigned has in consequence received a special order to solicit,

'That his Majesty's government will adopt the most effectual measures to put a stop to the unbecoming and seditious publications with which the newspapers and other writings in England are filled.'

"Is this then called requiring our laws and constitution to be changed?—and what is our answer? We begin by accusing them of want of temper (vide Lord Hawkesbury's letter, page 41); acknowledge that very improper paragraphs have been inserted in our newspapers, and publications of a still more improper and indecent nature, appeared under the signature of foreigners: that the French have thought proper to resort to recrimination. We then talk highly of the liberty of our press; insinuate we mean to continue to abuse them: but they need not read our pamphlets or newspapers unless they like it, or admit them into their country, but punish those who do. The French are silent: they mention the subject no more. We call ourselves insulted, go to war, and adduce the requisition as one of the causes.

"Fifthly, The presumption of affirming that Great Britain cannot singly contend against the power of France, is too puerile to be commented upon: it was unworthy the dignity of a great nation to make the assertion, and unworthy that of another, gravely to bring it forward among the causes for war. I should not have thought it worth while to have brought the matter to the test, had the Chief Consul, in still more boyish frolic affirmed, 'he would fight us with one hand tied behind him.'

"The subsequent paragraph in the same paper of communication (Official Correspondence, p. xxiii), is more worth our attention.

'But we have better hopes; and we believe in the British cabinet nothing will be listened to but the counsels of wisdom, and the voice of humanity.'

"Sixthly.—Manifesto published in the *Hamburgh Gazette*.—It is not a little surprising to find inserted in the catalogue of offences, this manifesto; for upon our demand of immediate satisfaction, every authority from the French government for the publication of it was denied, and most completely disavowed (vide Official Correspondence, p. 127). Upon our further insisting that, as the insult was public, so must be the reparation. M. Talleyrand answered: 'the First Consul considered M. Rheinhardt's conduct so reprehensible, that every satisfaction might be expected!'

"If then the paper was really published by order of the First Consul, we have the as-

crifice of truth on the altar of Peace. What would we have more? A futile argument is sometimes made use of, that these causes are nothing if singly taken, but altogether amount to a sufficient one. But if individually they are nothing, and are proved to be so, can an aggregate of nothings ever amount to any thing?

"Does there yet then appear a reason why we go to war?"

Under the seventh head, which is discussed in the least satisfactory manner, the author considers the charge of aggrandizement.

"One cannot but be grieved that a people so generous, a country so delightful as Switzerland, should wither under the gripe of despotism and oppression; and it would have been a gallant piece of Quixotism to have prevented such a fate by our assistance, if possible. We endeavoured to do it, broke our treaty to do it, retook the Cape of Good Hope, and would have dashed precipitately into war, could we have got the other powers to have joined. We might then indeed have entered into an impolitic war with honour, repel violence and aggression; whereas now we plunge into an impolitic war, with all the odium of aggression and breach of faith upon our backs. We remonstrated in favour of the Swiss; but the Swiss submitted, and we said no more. How then is this business, which was settled in October, 1802, brought up again as a cause for war in May 1803?

"We did all we could to get into a war for an object politically of no consequence to us: indeed the possession of Switzerland by the French, is a manifest advantage to this country: it occupies their troops, removes them farther from us; gives them a territory they must always be upon the alert to retain, subject to perpetual insurrection and revolt. It is a different case with Holland. The possession of Holland by the French, might be of material ill consequence to us; but there was no stipulation in our treaty of Amiens, that the First Consul should withdraw his troops from thence; they lingered there, to the annoyance of the Dutch, and jealousy of our government; the greatest part of them undoubtedly intended for the expeditions to Louisiana and St. Domingo (would we had let them quietly embark for those places!) The Dutch made some remonstrances (urging their departure), in which we would have joined, but they wished us to desist, for fear of drawing down upon them the fate of Switzerland (vide Mr. Liston's Letter, p. 201). Bonaparte afterwards declared he would withdraw his troops, the moment the treaty of Amiens was fully completed on our part, and Malta evacuated according to agreement. We however do not fulfil our treaty, but go to war. The French seize their territory, and we their ships. So much for the Dutch.

"When the French are accused of annex-

ing Piedmont and Parma to their dominions, it is added, 'without allotting any provision to the King of Sardinia, whom they had despoiled, though bound by a solemn engagement to the Emperor of Russia, to attend to his interest, and provide for his establishments\*.' Is this aggression and violence against us? It is aggression against Russia. Are we to monopolise all insult and aggression? What says the Emperor of Russia? Nothing that we hear of. Are we then to fight for the fulfilment of engagements with Russia, and treaties with Austria? To make unprecedented sacrifices and unheard-of efforts, for the two great emperors of Europe, while they look on at ease? Is it to be guardian of good faith, moderation and justice, that thus dauntless and alone we throw down the gauntlet before this giant power?—to prevent innocent states from being insulted and despoiled, and shield the world from his colossal arm; to protect the universal globe, from the German Ocean to the Indian Sea; to emancipate the Dutch, liberate Switzerland, defend Egypt, Palestine and Syria, the Ottoman Empire, Persia and Indostan?

"Magnanimous idea! But is there reason to imagine we shall obtain one single object; reconquer from Bonaparte one of his European acquisitions; drive Egypt from his head, or India from his thoughts: yet unless upon these knight-errantlike principles, unless to attack these windmills, is there a cause why we should be harassed with the calamities of war?"

Dismissing the chivalrous or quixotic grounds of war, and taking it for granted that Switzerland, because it cannot be aided efficiently, was to be abandoned to its unavoidable fate, does it follow, that Holland, which France had agreed to evacuate, and had not evacuated; that Holland, whence the invasion of Great Britain is so practicable and so dangerous; that Holland, a nursery of sailors, a proprietress of colonies, a fountain of loans and subsidies; that Holland, the usurpation of which places all Westphalia at the mercy of the French, and enables them any day to institute or proclaim a new republic of the Weser, of

the Elbe, and to extend their line of coast to Bremen and Lubeck, does it follow, we say, that Holland was not worth a war, or that Great Britain was bound to resign either Malta or the Cape, before the evacuation of Holland?

Holland being, however, the only tolerable pretence, and the only rational object of war, ought to have occupied the fore-ground in the correspondence; and the offer of Hanover ought long ago to have been made to Prussia, for a new campaign of 1787. With no other aid can Holland be redelivered.

The somewhat intricate question of Malta is well elucidated, and the right of the French to expect the evacuation is recognized.

The concluding paragraphs deserve to be impressed on every memory. This is one of them:

"Little, however, is it to be expected that the counsels of temperance should be heard amidst the din of arms and tumult of passion. Had England been in the habit of attending to a warning voice, much blood and treasure had been saved to the nation. In the American war, a voice cried—'Give up America.' Had it been at first attended to, how much would have been saved? America was obliged to be given up. But the 'sun of England, instead of setting for ever,' as pronounced by great authority, set not at all; but like the sun beyond the Arctic circle, wheeled up again to its meridian height, and shone with brighter lustre. In the last war, many voices cried—'Make peace, seize your opportunity; the longer you delay, the worse peace you will make.' I will leave the fact to justify the advice and the prediction.—What will be the case in this instance? After millions upon millions expended, and blood upon blood shed in vain, the French, if they choose to persist, will in all probability sooner or later be in possession of Egypt; and if our drained treasury and exhausted veins recover, if we do not perish under the conflict, things will go on as well, or better than they did before, and India be as safe."

ART. XXXVII. *The Reason Why: in Answer to a Pamphlet, entitled, Why do we go to War?* 8vo. pp. 66.

THE author of "*Why do we go to War?*" has arranged, under eight heads, the various motives of hostility which presented themselves in the course of the Official Correspondence. He maintains

that none of them were such as to justify the declaration of war, because the weightier motives wanted maturity, and the maturer motives wanted weight.

This writer, with unprovoked inurba-

\* "Vide Declaration."

† Mr. Gentz, in his excellent work on the State of Europe, asserts, that 'the loss of the colonies was the first era of the lasting and independent greatness of Great Britain.'

nity of language, insults that very temperate and argumentative author; and, in the true spirit of the anti-jacobin school, vomits at him a spawn of nick-names and abuse, instead of refutation. He says (page 6) that the war is just, because the people have been unanimous in arming to defend the independence of the country. A highwayman may defend himself against a constable; does it follow that the attack is unjust? He says (page 7) that the preparations in Holland, which were very trifling, and probably intended to carry out troops to Louisiana, formed a sufficient ground for attributing hostile intentions to France. He examines one by one the eight grounds of hostility; and fails one by one in proving that they amount to any thing more than proofs of a subsisting reciprocal jealousy between France and Britain; a jealousy which every one knows to be perpetual, but which surely does not constitute a ground of perpetual interminable war.

The seventh charge, or charge of aggrandizement, as this writer calls it, ap-

proaches nearest to a ground of war; but a voluntary war, to resist the aggrandizement of a neighbour, is plainly absurd, if not likely to be successful. Now there was no probability of the assistance of Austria to free Switzerland, or of the assistance of Prussia to free Holland at the time of the declaration of war, and consequently no prospect of remedying the grievance in question.

The eighth charge, about Malta, might have been made more of; yet, if this be our ground of war, it is plain that the declaration of hostilities should have been left to Bonaparte, and not have proceeded from us; for as long as we retained possession unmolested, we had nothing to complain of on our side.

At last, however, as if aware that the war is wholly premature, this writer (at page 47) has recourse to the old pretence, the balance of power; but, alas! neither our finances, nor the foreign battalions, are as yet sufficiently recruited for the old interchange of subsidies and aids.

ART. XXXVIII. *Observations suggested by a Pamphlet, entitled, Why do we go to War? in a Letter to a Friend.* 8vo. pp. 32.

THESE observations are drawn up with the respectful urbanity to which the author of "*Why do we go to War?*" was, by his temper and talent, entitled. They maintain very truly, that the British ministers have been actuated by a pacific spirit; that they overlooked the gross abuse of French power, in the judgments respecting the *Fame* packet and the *George* brig; and that no active encroachments on their part have brought on a rupture between the two countries. The French, on the contrary, are justly stated to have proceeded with an insolent consciousness of superiority; their consuls were furnished with dangerous instructions, and with the insidious protection of military rank; they quibbled about the harbouring of emigrants, and the liberty of the press, while they were rivetting the fetters of Switzerland, and preparing the annexation of Holland; they endeavoured to enforce, by a threat of war, the evacuation of Malta, which was the only object of real ambition they could not attain by the mere exertion of physical force. Yet it cannot be denied, that their diplomatic conduct has been directed with superior skill; that they

have regularly submitted to every repulse on topics, in which they were the aggressors; and that they have made their stand with resolute defiance, precisely where the apology of Great Britain was most difficult and most equivocal; thus they have thrown on us both the fact and the reproach of aggression, in a war certainly not sought, not desired, not deserved by our ministers. But if a country, from the personal character of the prince, from the structure of the constitution, from the venality of its talent, or from the apathy of the people, or, which is perhaps the case, from the credulity of mere statesmen, in the hopes of some gambling merchants, chooses not to withstand loudly the first tendencies to bickering, not to insist loudly on the promotion of its pacific and principled talent, it must abide by the incurred evil, and by a subsequent process check the tendency to a repetition of the blunder.

After so skilful a defence of the declaration of war as this, few can hope to succeed in its defence. The ambitious mind of France is abundantly proved, and the determination to proceed in its views, with a contempt for British re-

sistance; but nothing like a ground is made out for beginning that resistance, at the time it was determined upon. It is of immense importance, it is the condition of alliances without, and of perse-

verance within, to secure a definite, intelligible, equitable, honorable ground of war; without it taxation seems oppression, and battle needless carnage.

ART. XXXIX. *A Reply to two Pamphlets, in Answer to the Question, Why do we go to War?* 8vo. pp. 60.

THIS answer, if not equal in neatness to the original pamphlet, is full of convincing argument and important remark. It tends to predispose the public to conciliatory measures, without, however, advising any dereliction of real dignity, still less of national interest. The author has stated very specifically his ideas of an expedient peace: he takes high ground, higher than it will be easy to realise; but the first step towards insuring the constancy of the country, is to proclaim a disposition to equitable arrangement.—This writer possesses, in a high degree, that power of voluntary transmigration, which enables him to view awhile, with the eyes of the adversary, the claims and pretensions of his country. This faculty is the basis of equitable estimate, and is only mistaken by the bigot and the bully, for an attachment to the adverse cause. No man can detect the remedy for foreign hostility, who is incapable of entering into its grounds. To consider this elevated, this cosmopolitical point of view, as an imperfection, is a mark of narrow views, and vulgar prejudice; it ought to be noticed as characteristic of a superior mind.

With a proper solicitude to prevent the northern growth of France, which tends to endanger our own quiet and independence; with a philosophic indifference to the southern growth of France, which tends to provoke other rivalry and

opposition, the author thus sketches his plan of peace:

“On these various accounts, resigning all pretensions to a possession in the Mediterranean, were I to suggest the idea of a basis upon which to form a treaty of peace, whenever there is a chance of Europe being once more blessed with such an event, it should be upon the following plan, which might be extended or contracted as circumstances should warrant.

“Malta to be surrendered, given up to the Maltese inhabitants; King of Etruria, and Italian republics to be acknowledged; the King of Sardinia to be provided for; Switzerland to be evacuated by the French; Hanover restored, and the damages compensated; Holland to be emancipated; the French troops to be withdrawn as soon as possible, and every security that can be obtained taken for its independence; the Netherlands to be made a separate state, under the dominion of the King of Prussia, or the Prince of Orange, or to become a distinct republic under whatever form of government the inhabitants may choose; Gibraltar to be disposed of to the Spaniards, in order to defray the expences of the war; and thus to turn the key on the closet of discord, shut the gates of that amphitheatre, that vast naumachia, where we should consume our strength in vain exertions for the amusement of surrounding spectators.

“But whether this tremendous war is to be concluded by these or any other means, I am happy to be able in something to join my opponent (author of ‘The Reason Why,’ p. 55), and that is, in wishing with equal ardency that it may be soon concluded.”

ART. XL. *Thoughts on the Invasion threatened by Bonaparte; translated from the French of E. M. one of the Chiefs of the Royalist Party in the South of France.* 8vo. pp. 75.

THIS pamphlet contains little that is applicable to the invasion of Great Britain; but much virulent declamation against Bonaparte, his crimes, and his supporters. Of the anecdotes in the notes several are rashly advanced; as that Garnerin, the balloon-man, was the assassin of the Princess of Lamballe. It is surely in this case impossible that he could have obtained letters of introduction so respectable as some which he

presented in London. Yet a great many of the anecdotes are vouched on personal knowledge, and deserve the notice of the historian. The author is an emigrant royalist who has taught French at Bath.

The note at p. 49, contains some original matter concerning the accession of Bonaparte.

“Bonaparte owes his elevation to his brother Lucien, now one of his greatest enemies;

to Murat his brother-in-law; and particularly to the death of general Joubert, a loss we do not well know to whom to attribute. The following is a short account of the events that preceded his usurpation: during the invasion of the Russians under the command of general Suwarrow, the French army was almost annihilated, by the frequent defeats it had undergone; the people loudly complained, and France hourly expected to be invaded by the conquering allied powers. The directory then adopted the plans of Robespierre; but the artful Sieyes, perceiving the deplorable situation of affairs, owing to the bad administration of the directory, exerted himself to the utmost to overturn it; and proposed to his accomplices to establish a more gentle government, that would better suit his ambitious views. In order to effect this, he held secret cabals with the different members of the two councils. Joubert, being young and enterprising, was selected as a fit commander for the armies of Italy; and Sieyes, depending on the military talents of his protégé, intended to recall him when he should have defeated the enemy, to destroy the directorial faction; but Joubert falling a sacrifice, their manoeuvres were changed. In the mean while, general Fregeville, representative of the people, and lately married to the daughter of a rich broker of Beziers, (to whose charms he was indebted for his intimacy with Lucien,) was charged by Sieyes to engage the latter to second his plans; this he effected, and it was determined that Napoleon should be privately recalled, being alone capable of executing these great designs. From this time forward, their secret assemblies were held in Madame Fregeville's *boudoir*, till the arrival of Napoleon, who immediately seized on the Consulate, (by fainting in the arms of his grenadiers,) to the great disappointment of the conspirators commanded by Sieyes. Madame Fregeville received 100,000 crowns, under the name of a present, as the price of her complaisance. Sieyes and Lucien had both aspired to the supreme command, thus

snatched from them by Bonaparte. Sieyes, on the new digestion of the present constitution, received, as an equivalent, a national estate, and Lucien was made minister of the interior; which not being sufficient to satisfy his ambition, highly exasperated him: Fregeville also was disgraced; but Bonaparte, dreading the anger of his brother, appointed him ambassador at the court of Spain, (intended as an honorable exile for a short time.) Napoleon then joined the army of Italy, and unjustly ascribed to himself the victory of Marengo, that was acquired by the courage and abilities of general Desaix, who perished in the action: he made this a pretext to get himself named Consul for life, (a nomination exacted by force.) This new dignity more than ever excited the jealousy of his brother Lucien, and of the other generals."

The recording of crimes is not a useful occupation. It always diminishes in the readers of such narratives the aversion to vindictive retaliation. Catalogues of horrid deeds provoke enmity indeed against the persons and the sects to whom they are ascribed, and bring those individuals and their opinions into discredit; but they almost always produce analogous crimes in the imputing party. Voltaire and the anti-christians of France, were continually harping on the massacre of Saint Bartholomew, and describing minutely its circumstances. What was the consequence? These very descriptions served for the model of the massacre on the second of September. "We will be even with them;" this is the secret resolution which all such histories of atrocity excite in the vulgar of the opponent faction. One cannot but wish, therefore, that all those who write for the multitude, would be very shy of detailing enormities.

ART. XLI. *Invasion! Reflections on the Terrors of it. By the late very Rev. and venerable DR. TUCKER, Dean of Gloucester.* 12mo. pp. 12.

WHEN the dean of Gloucester wrote, the French territory extended no further east than Dunkirk; it now avowedly includes Flushing, and in fact extends to Emden. Sir Sidney Smith has stated in parliament, that from the ancient coast no efficacious invasion was practicable; but that from the modern, or Dutch coast, it is practicable. The maritime reasons for non-alarm formerly do not therefore all apply now.

The French had, in 1780, many means of annoying us, in North America, and in the Indies; they were likely to prefer

that direction of their forces and treasures which would do most injury. They have now but one mode of annoying us, invasion. While they could choose the cheaper task, they chose it; but now they must invade, or do nothing.

The French had formerly a mild humane prince, unwilling to fling away on rash ventures the lives of his people. They have now a monarch more covetous of dominion than of subjects; and an army too strong for the permanence of internal tranquillity, if it be assembled

and idle. The chance, therefore, of rash venture is much increased on their part.

Let us suppose that of a force embarked, without a protecting navy, in Dutch fishing-boats, one-third would be met and sunk at sea. Let us suppose another third would be run aground on the shoals and sand-banks near the English coast, in consequence of cutting away the buoys, and snuffing out the light-houses; there would still remain a third to be fought by the people ashore.

Some persons so much doubt the policy of driving the country, as it is called, that is of destroying all the corn, flour, and other provision in the sea-ports near the landing-place, that it will probably be inefficaciously executed. The people think that the French would take care to be fed in preference; and that they should be starved themselves by the at-

tempt at starvation. The necessity for transports, therefore, about which so much is said here, may be overstated.

We are assured by this author, (p. 7) that from the time the French boats are seen in the offing, to the time of landing, three days must intervene. How extravagant a calculation! How ignorant an assertion!

And, after all, why allay the public apprehension? why diminish the public precaution? Is not the volunteering system as favourable to peace and to liberty, as to protection? We presume, however, that some persons, who dislike to learn the use of arms, choose to be supplied with pretences for indolence—and the most decorous is to see no danger. To such persons, we recommend the purchase and distribution of Dr. Tucker's *Reflections on Invasion*.

ART. XLII. *Proceedings at a General Meeting of the Loyal North Britons, held at the Crown and Anchor, August 8, 1803; containing a correct Copy of the celebrated Speech of James Mackintosh, Esq.; the Stanzas spoken on the same Occasion, by Thomas Campbell, Esq.; and the Substance of the Speeches of the Right Hon. Lord Reay and J. W. Adam, Esq. on being elected Officers of the Corps.* 8vo. pp. 43.

IT is sufficient to copy the title of this little pamphlet: we would, however, notice one trivial error in Mr. Campbell's stanzas: he says

Let a death-bed repentance be taught the proud foe.

But the spirit of his poem is to swear that the invaders shall not die in their beds.

ART. XLIII. *England's Ægis; or the Military Energies of the Empire.* By JOHN CARTWRIGHT, Esq. 12mo. pp. 191.

IT is particularly worthy of remark, and ought to teach us a lesson of toleration and confidence, that the numerous body of people who were injuriously marked by the last administration as disaffected, and eager to overthrow the constitution, are actually now among the foremost to offer their lives in its defence. It is a fact, that in some parts of the kingdom, a majority of the volunteer corps is composed of those persons, who, a few years ago, were branded as republicans and levellers: their country is in danger, and they have evinced their patriotism in coming forward in its defence. The name of Major Cartwright is familiar to most of our readers: he has employed his pen and his sword on more occasions than one; and it is well known that the freedom, perhaps the incautious freedom with which he

The appendix contains, among other pieces, Mr. Bonsanquet's Declaration, Burns's fine ode of Bannock-Burn, and the War Song of the Edinburgh Dragoons, one of the productions of a gentleman, of whom every production is good.

has used the former, excited the suspicion of a jealous administration, as to the use he might be disposed to make of the latter.

The plan which Major Cartwright recommends, as being in itself the most efficient for defence, and constituting at the same time an essential part of the constitution of the country, is, that the King should have recourse to the original militia of the Saxon times, the *posse comitatus*. He reprobates standing armies as injurious to the liberties of the subject; contends that every man should be taught the use of arms, and be possessed of them; in short, he would have the volunteer system extended to embrace every individual, and instead of being a temporary, converted into a permanent measure of defence.

In addition to the Ægis as a shield,

Major Cartwright has dedicated to his country as a weapon, the *Britannic spear*: this weapon is described at length, together with the double-barrelled *boarding pistol*; their advantages are detailed, a plate is given of them; a pattern of the spear will be deposited with some mechanic who will undertake to make them, and a reference left with the publisher of Major Cartwright's work.

We are not very conversant in tactics, or competent to appropriate the comparative excellence of different weapons; we have, however, remarked, that when any desperate onset is to be made, it is customary to take out the flints from the soldier's firelock, and charge with the bayonet. This looks as if the musquet had lost its superiority: pikes and spears are getting into fashion, and we should like to see revived the old English weapon, that victorious weapon *which defeated the French on their own soil*, on the plains of Cressy, Poitiers, and Agincourt, the long bow. For several successive centuries, this country acquired a formidable celebrity for its skill and success in archery: all our victories over the French in their own country were effected by the bow, and these victories are known to be many and decisive. The carnage produced by this weapon, particularly where it is opposed to cavalry, is dreadful; and at Poitiers, the English took prisoners to the amount of double the number of their own army! It has been estimated that not more

than one ball in eighty-five takes effect, in a day's action.

About six years ago Mr. Oswald Mason published a little pamphlet, entitled "*Pro Aris et Focis*," &c.; the object of which was to revive the use of the long bow and the pike; it was published for Egerton. A republication of it now would be of service, and if it were enlarged by an historical account of the different battles in which we have fought with this national weapon, by an account of the numbers of the contending armies, and the weapons of our enemies; and if to this was added, an account of the principal statutes, which at different times have been enacted for the enforcement, and of prizes, which at different times have been offered, for the encouragement of the long bow; it would be a very interesting and useful work.

There are a few societies of archers at this time in Great Britain; the Toxophilites, the Woodmen of Arden, and the Royal Company of Archers in Scotland, which last is said to have been instituted by James I. of Scotland, for the encouragement of archery. The majority, if not the total of these societies, however, are now merely societies for exercise and amusement, like cricket clubs: whether they might not be increased and made subservient to the national defence, is a question which we must leave to the discussion of others.

ART. XLIV. *The Parallel between England and Carthage, and between France and Rome, examined, by a Citizen of Dublin.* 8vo. pp. 47.

IT was hardly necessary to write a pamphlet to shew the absurdity of the boasted parallel which France has made between herself and Rome, and between England and Carthage. It has given occasion, however, to some animated

declamation on the part of a patriotic citizen of Dublin, who, if he speak with the same fluency and spirit with which he writes, might harangue an army on the eve of action with considerable effect.

ART. XLV. *A few Cursory Remarks upon the State of Parties during the Administration of the Right Hon. Henry Addington.* By a NEAR OBSERVER. 8vo. pp. 48.

ART. XLVI. *A plain Answer to the Misrepresentations and Calumnies contained in the Cursory Remarks of a Near Observer.* By a more ACCURATE OBSERVER. 8vo. pp. 83.

THE former of these pamphlets is an attack directed for the most part against the expelled chiefs of the anti-jacobin ministry, for their parliamentary conduct towards Lord Hawkesbury, Mr. Addington, and the other underlings of

the party, who found themselves converted into ministers by the dismissal of their masters. The charges and accusations here brought forwards are repelled, or attempted to be repelled, by the author of the latter publication.

The *Near Observer* begins by representing the late ministry as voluntarily seceding from their official situations at the most critical and difficult period of the war; when, abandoned by our allies, mortified by defeat, weighed down with accumulated taxes, our sovereign indisposed, and incapable of administering the affairs of his government, we were left to contend, single-handed, both with the French republic and the Northern confederacy. "At such a moment," says the author, "his majesty's late ministers thought proper to retire from his service," &c.

This charge is refuted by the *More Accurate Observer*, who affirms that Mr. Pitt and his friends had tendered their resignations "days and weeks" before the king's illness; and that at the time of doing so, Mr. Pitt made a distinct offer to retain his situation until the war should be concluded, and the country relieved from its most pressing difficulties, provided that, in the mean time, no attempt should be made to prejudice the question; a difference of opinion on which had led to his resignation. Although this offer was not accepted, the king's illness suspended the new arrangements, and Mr. Pitt actually remained in the full exercise of his official duties till the recovery of his majesty.

The second accusation relates to the violation of a solemn promise of support made by the old ministers to the new. "His majesty's most gracious offer of his confidence to Mr. Addington could not have been, and was NOT, definitively accepted until a solemn authentic pledge of honour had been given by the late ministers for their CONSTANT, ACTIVE, and ZEALOUS SUPPORT. I do assert that Mr. Pitt and Lord Grenville did sacredly and solemnly enter into this *exact agreement*, and in this *precise form of words*."

In reply to this serious charge, we find nothing satisfactory advanced by the *more accurate Observer*; he says, indeed, and says truly, that to give to any set of men a promise of constant support, let their conduct be what it would, is inconsistent with every idea not only of public duty, but even of common sense, or common honesty. This, however, appears to be rather an imprudent assertion, because, so long as the direct testimony of his adversary remains uncontradicted, it will follow from his

own admission that Mr. Pitt and Lord Grenville are both fools and knaves.

The last important subject in dispute between the *Near Observer* and the *Accurate Observer*, relates to the negotiation between Mr. Pitt and Mr. Addington, on the readmission of the former to a place in the cabinet. This we shall present to our readers first in the words of Mr. Addington's partizan.

"This negotiation originated with Lord Melville, and was conducted by him; nor do I at all fear being mistaken in stating, that the intentions and conduct of that noble lord were fair, honourable, and impartial.

"In the negotiation which his lordship conducted, I think it proper that it should be known, that there was no obstacle upon the part of ministry to his lordship's return, with Mr. Pitt and others of his friends; I do not say upon a footing of equality with Mr. Addington and others of the present administration, but beyond it. It is proper that it should be known, that the treaty did not go off (as has been pretended) on account of the want of a message from a quarter, too high to be mentioned, a communication which would not have been wanting in due time, if the negotiation could have been brought to an issue upon the terms I have mentioned; but that it broke off upon the positive unalterable demand of Mr. Pitt himself, to bring back with him the Lords Grenville and Spencer, with other noble and honourable persons, who had disapproved of every measure of the government, who were in the habit of personal incivility and disrespect, and who were adverse to the whole spirit and principle of the administration."

The *More Accurate Observer* on the other hand, says:

"Towards the end of March, or at the beginning of April, upon the eve of war, after it was distinctly known to Mr. Addington that Mr. Pitt strongly disapproved of some of the leading measures of his government, and after an overture had been made on the part of Mr. Addington, too foolish, I had almost said, too insulting to be noticed, a distinct proposition (originating, not, as has been insinuated, with Lord Melville, but entirely with Mr. Addington himself), was made to Mr. Pitt, the object of which was his return to the official situation he formerly held in the administration; and, as I understand, the arrangement was to have taken place whenever the negotiation then pending with France should have been brought to a conclusion. It was also signified, that vacancies would be made for the purpose of admitting Lord Melville into the cabinet, and some other of Mr. Pitt's friends

into different official situations. To this proposition Mr. Pitt replied, that he would not enter upon the question of arrangements, until he was distinctly informed by a message from the highest quarter, that his services were thought essential; that if so called upon, in spite of the precarious state of his health, he should not decline the offer of his best advice and assistance; that he was fully aware of the great and increasing difficulties of the country; and that he saw the necessity of a strong, vigorous, and efficient government. That if called upon by his majesty, he should feel it to be his duty to propose an administration consisting principally of the members of the present and of the late government; that in the general arrangement which he should submit for his majesty's consideration, he should, if they assented, include the Lords Grenville and Spencer, but that he should press no person whatever upon his majesty, only reserving to himself the power of declining the undertaking altogether, if he could not form such a government as would enable him, in his judgment, to conduct the affairs of the nation with a fair probability of success. No

*sine qua non* was insisted upon, as the "Near Observer" alleges, with respect to the admission of Lord Grenville, or of any other person, into the cabinet. All that Mr. Pitt required was, that he should be at liberty to submit to his majesty whatever he thought best for his majesty's service, unfettered by any previous condition; and he positively declined committing himself upon the question of particular arrangements until his majesty's pleasure had been distinctly signified to him."

We pretend not to reconcile these palpable contradictions, nor to decide whether the ex-minister or Mr. Addington, by these their representatives, is attempting to impose upon the public: they have been both brought up in the same school of intrigue and falsehood, *et cantare pares et respondere parati*; but from the proverbial candour and veracity of Lord Melville, we may, no doubt, expect, at the proper time, complete satisfaction.

#### ART. XLVII. *Elements of Opposition.* 8vo. pp. 99.

THIS is by far the most acute party pamphlet that has appeared since the accession of Mr. Addington to the ministerial throne. It consists of fifty-three rules, by the due observance of which, the young senator may become a complete oppositionist; the examples are principally taken from the speeches of Lord Grenville, Mr. Windham, and the other leaders of the anti-jacobins, whose political profigacy and shameless inconsistencies are exposed with no inconsiderable effect. We select the following, as a favourable specimen both of the style and matter.

##### "RULE 29.

##### "How to describe a new minister.

"However, as the country may not like the exclusive claims of one family, and as another candidate has been proposed, it is every way fair and proper to state his qualifications. His particular friends, indeed, to whom he lends the weight of his talents, are content with promising the country that he is more fit for the eminent station of first minister, than any other person; that Mr. Pitt is jealous of his ascendancy; and that all the sound part of the nation look to him at this crisis, &c. This too is modest, and it ought to be shewn by particulars, how just, as well as disinterested, such a recommendation is. The qualifications, therefore, for a first minister ought to be the following:

"1. He should be himself alarmed, and fond of alarm in other men. Such a man will compliment Lord Mornington for having described things "in so masterly and alarming a manner." Accordingly we find, that these very words were used by Mr. Windham, Jan. 1794.

"2. Such a man, if accused of inconsistency, will immediately allow it, and disarm an opponent at once; for where is the use of urging a man upon a point which he readily grants, and about which he appears to be utterly careless?

"He had no objection to suppose inconsistency in his language on two occasions of a similar nature, viz. voluntary contributions.

"He would not answer how far 'an eager desire to carry his immediate purpose might have hurried him in the assertions he made use of.' And, 'perhaps, in the eagerness of debate, he had employed expressions with inconsiderate warmth.' Mr. W. April 7, 1794.

"After this, Mr. Grey had no need to express the 'pain he felt, that a gentleman should treat even his own opinions so lightly, as to say he had inconsiderately taken up arguments which he could not justify, for the sake of carrying his purpose for the moment; and that he should do this at a solemn meeting of his county. And what must be thought of a gentleman acting with such levity?"

"Mr. Grey, we all know, is very properly tenacious of an opinion once expressed; But the future minister of this country is

well read in that great master of nature, Shakespeare, and acts upon the magnanimous plan of indifference to any thing he may have said or done. When Justice Shallow upbraided Falstaff with having broken into his park, and stolen his deer, 'I have, Master Shallow,' replied Falstaff, 'I have—so I hope that's answered.'

"3. Under the protection of this courageous indifference (a better protection than a 'sevenfold shield'), such a man will securely praise in 1795 a motion concerning volunteer corps, because it went farther than the former measures of 1778 and 1782, and 'made the force applicable to the defence of the whole of the country.' And in 1803 he will as securely condemn the measure which establishes and extends the principle itself of 1795, and will prove that the volunteer force is no better than an 'armed rabble,' fit only to 'consume provisions,' to 'choak up the roads,' and to 'stand in the way of the regulars \*.'

"4. Such a man will say in 1803, that the country cannot meet France single-handed, for it is 'out of condition to go to war.'—March 9. Nor will he care if an opponent reminds him, that in Dec. 1794 he maintained, 'it was not the character of the English to despond. Perseverance and invincibility were their characteristics: they had met France single-handed in her proudest day.' Or that in Jan. 1795 he 'warned the house not to be led away by the motives that induced gentlemen on the other side to paint the situation of the country as they had done!'

"Let other men be sore when contradictions are proved upon them; nothing of this sort can move the man who has 'no objection to suppose inconsistencies in his language.'

"5. Such a man will say in 1803, that regular troops alone are fit to meet an enemy, and that 'the militia and other corps are no better than a mob' in comparison of them: nor is it any thing to him, if in Nov. 1795 he undertook to answer Gen. M'Leod's objections to his fencible troops, (viz. that they could only defend the kingdom from invasion, or preserve its internal tranquillity), and to maintain, that 'it might as well be asked, Of what use are any troops at all? They were of double use, because they might be employed against the attacks of a foreign enemy; and they might be raised with greater facility than other troops, because they were not to go out of the country.' And it is equally immaterial to him, that in Dec. 1797 he proved the fencibles to have also this advantage, that 'they partook more of the nature of a militia, than of regular troops!'

"But other men may contradict themselves, and forget it after a few years. The future minister of this country will, in the

same year, and very nearly in the same debate, contradict himself, and forget it, or (which is the same thing) will care nothing for the consequences. He will talk of the merit of regular troops alone for all purposes, offensive or defensive; and in a moment these invaluable regulars shall be turned about their business. 'Nothing but the line can defend us, and all levies should be into the line.' But 'the best method of defending the country, is to fight like the Vendéans—that is, behind trees, and bushes, and walls!' Now, a common debater would endeavour to secure himself in the best manner he could, when pressed by an opponent under circumstances so unexpected and untoward. If upbraided with abandoning the country to the protection of bush-fighters, he would answer, 'All the world knows with what vehemence I dwelt on the exclusive advantages of the line.' And if attacked on this undue preference of the line, he would turn upon his antagonist, and briskly ask, 'Did I not extol an armed peasantry above the line itself!' And, to say the truth, it is convenient enough to set out with two principles of opposite natures, and to take refuge in either, as necessity may require. But the destined minister of this country scorns these subterfuges, which are more calculated for ordinary men. He has 'no objection to suppose inconsistencies in any thing he says: and though some people may not like inconsistency in a minister, surely much more is gained on the ground of intrepidity; a quality particularly acceptable in dangerous times like these.'

"6. Such a man will go to war for any thing. 'Any spot upon the earth or sea, though fit only for the contention of seals and sea-gulls, may assume a much more important aspect, and become a legitimate subject of diplomatic interference, if honour is connected with it.'—Mr. Windham, Nov. 1801.

"And hence we may see how unreasonable Burnet was, in saying that it seemed an odd thing for France to go to war formerly about some old furniture of the duchess of Orleans. But, on the other hand, the future minister of this country shall say, whenever he pleases, that honour is nothing, and interest every thing; nor shall he care for the contradiction.

"I will put the point of honour out of the question. I will not push it to a wild, extravagant, and chivalrous excess; for national honour, when rightly understood, is, generally speaking, nothing more than national interest. In general, there is nothing dishonourable in giving up this or that, when it is not disadvantageous to the national interest.'—Mr. Windham, Nov. 1802.

"It is the privilege of greatness to be careless about itself; while it draws the attention of all towards it. Thus the destined minister

of this country talks as humour suggests; and all parties look to him as their patron. To the high-flying spirits he carries himself, as he well expresses it, in a 'wild, extravagant, and chivalrous excess.' And while he is in this humour, 'he will deplore neither the destruction of commerce, nor the decay of manufactures, nor the loss of resources, nor the total annihilation of wealth.'—Mr. Windham, 1797. Nor will he have any objection (if he is pushed upon the question) to hold out to his brave countrymen, the inviting prospect of a never-ending war, if the country should be so fortunate as to have him for first minister!

"It is asked, Are we, on the principles I have laid down, to wage an eternal war?—I answer, 'that, on the principles I have stated, it is clear that there is an eternal resolution on the part of France, to destroy

this country: and I am unable to see any other alternative!'—Mr. Windham, Nov. 7, 1801. But, in a moment, this high strain shall stop, and to the money getters it shall be proclaimed, that the beginning and the end of all wars, is interest alone; for 'honour, when rightly understood, is nothing more than interest;' and the nation may give up any thing, when it is not 'disadvantageous to the national interest' to part with it: Who does not see, from all this, that Mr. Pitt has great reason to be 'jealous of the ascendancy of Mr. Windham,' and that the one gentleman, who 'alone is proper for the station of first minister,' is far exceeded by the other gentleman; who 'lends the weight of his talents,' and to whom 'all the sound part of the nation look, at this crisis, for their opinions' concerning honour, and interest, and everlasting hostilities."

ART. XLVIII. *Four Letters to the Chancellor of the Exchequer, &c.* By WILLIAM COBBETT, 8vo. pp. 72,

IF we were members of parliament, and as hearty in our opposition to ministers as the noted author of these Four Letters, we should not pursue the same line of criticism. Far from attempting to invalidate any flourishing statements of the revenue, we should not only admit, but corroborate, them. We should endeavour to indicate those items, which had produced more to the public than was accounted for by office. We should endeavour to detect those private subtractions from the receipt, which supply a criminal expenditure. We should hold up the increasing abundance of revenue as a reason for alleviating the harsher clauses of money-bills, and for selecting very critically the less grievous projects of taxation from among the superfluous claims of ministerial precaution. We should object to levying more within the year than the yearly demand requires. We should found on the boast of repletion, the expediency of abstinence. But discontent has always its routine; and ministers so well understand it, that the line of opposition expected is, in fact, a convenient hostility. By representing their resources as unproductive, they are assisted in heavier extortion: by announcing that their estimates of expenditure are deficient, they are propped in extravagant provision for them: by mapping the progressive scale of our outgoings, the public mind is prepared for the continuation of the

habitual augment. The art of embarrassing cannot consist in repeating that catechism of objection, which has been said these twenty years, without producing embarrassment. The result of Mr. Cobbett's dissection of the financial statements of the minister is thus given:

" Total income of the Consolidated fund, in the year which ended on the 5th of Jan. 1803, including arrears of income-tax, &c. &c.	£32,423,605
" Add, for further produce of new taxes, which were imposed last year, but which were under collection only part of the year	2,000,000
	<hr/> 34,423,605
" Deduct arrears of voluntary contributions	£5,000
" — arrears of additional assessed taxes	47,125
" — income duty*	2,305,267
" — convoy duty	49,143
" — corn bounties not paid out of the customs of last year, and, therefore, not to be included in the income of that year	1,451,552
	<hr/> 3,858,087

\* Besides the three sums of arrears stated in the recapitulation of the preceding account, there are three other sums, stated under the detailed heads of income arising from the sources of 1798, 1799, and 1800. These make together 809,819l. which, added to the total of three sums specified in the recapitulation, produce a total of 2,305,267l. as is here stated.

- “ Total income of the Consolidated fund, in the present year, ending 5th of January 1804, unless increased by more new taxes - - - 30,565,518
- “ Deduct total annual charge upon this fund, as the said charge is stated at the foot of the preceding official account - - - 25,590,864
- 
- “ Actual surplus of the Consolidated fund for this present year, ending 5th Jan. 1804 - - - 4,974,654

“ This statement, sir, is fair, clear, and correct. Every thing that you can possibly ask is allowed. I have taken your own figures, and by those very figures I have produced a result, which incontestibly proves the deception contained in your ways and means laid before parliament on the 10th December. In those ways and means for defraying the expenses of the army, navy, ordnance, and miscellanies for the present year, ending 5th Jan. 1804, you took credit

for 6,500,000l., as the surplus of the Consolidated fund during the present year; and, unless your accounts now laid before parliament are false, or, unless you augment the income of the fund by new taxes imposed this year, I have proved, that the said surplus will amount to no more than 4,974,654l. a sum which falls 1,525,346l. short, not only of your estimate of the surplus, but of the credit which you took on account thereof, in your ways and means of the 10th December last. To this point, sir, I wish to hold you.”

The postscript contains an amusing detection of those tricks of office, by which accounts, made up for the public eye, are swelled in conspicuous places. The sum of 20,170l. was taken from 1801, and included in 1802, in order to *turn the corner of the million*, as Mr. Cobbett phrases it, and to increase the round number from 26 to 27 millions.

ART. XLIX. *The Day of Alarm: being a progressive View of the Spirit and Designs of the leading Men in France, &c.* 8vo. pp. 178.

IN order to give a specimen of the argumentative character of this writer, we will extract a page or two.

“ Full of that arrogant confidence which prompts them to assert the most palpable falsehoods, these shameless apologists have thought proper to record in lamentable strains what they denominate the massacre of Copenhagen. Who that knew not the real truth and nature of the event, to which they have affixed so shocking an idea, would not be led to imagine, that, in violation of treaties, and that against the common faith which ought to subsist between nations, and on which a peaceable and friendly neighbour depended for his security, Great Britain rushed upon him unware, and shed his blood without mercy? Who that knew it not, would think that France, having succeeded by its intrigues in forming a combination of the three northern powers against Great-Britain, a British fleet sailed to the Baltic, and destroyed the Danish navy at Copenhagen, and would probably have done the same to the navies of Sweden and of Russia, had they not had recourse to a treaty, which put an end to the hopes of France from that quarter?

“ When individuals take up the pen in defence of public measures, it is requisite to warn them, that without a strict adherence to truth, they will certainly injure the cause in which they are engaged. So infamous a perversion of facts as that above cited, is a notorious sample of French duplicity, and want of the commonest honesty; and ought to put upon his guard every man who seeks for information. The audacity of the French

knows no bounds in these matters. It costs them nothing to invent the most atrocious, as well as the grossest forgeries. Thus they have lately ascribed to British malice and rancour, the assassination of their two deputies at the negotiations of Radstadt, and have had the impudence to extend the like execrable insinuations to some of the vilest and most horrid events during the war.

“ Happily for the British character, it is of itself a sufficient refutation of such abominable calumnies: they are believed no where, and the French have been universally branded as liars. But they are not to be daunted in the career of falsities upon which they have lately entered: they seem to think it in their power to distort the most authentic facts, for the purpose of deceiving nations, and preventing them from forming just conceptions of the politics and transactions of France. They represent the wisest statesmen in the various courts of Europe, as uniformly of opinion, that the many alliances that have been formed with Great-Britain, have constantly proved pernicious to them, and serviceable only to Great-Britain.”

Here is much declamation, but not the slightest attempt to apologise for the attack on Copenhagen. The author would do well to read Seidelin's account of the engagement. The Dane's broken English will amuse him; and he may perhaps begin to suspect that both the projection and the conduct of the enterprise are to incur the eventual censure of history.

ART. L. *Reply to some Financial Mistatements in and out of Parliament.* 8vo. pp. 68.

THE impudence of speculation which had introduced itself among the establishments dependent on the admiralty, during Lord Spencer's superintendence, must have convinced ministers, as well as the public, that enormous abuses frequently prevail in subordinate offices, and that vigilance in a financier is as productive as a budget. We have little doubt that ministers are grossly deceived in the supposed produce of the several taxes; and that the revenue exceeds by many millions annually the timid and mutilated statements which are shown about to excite our patriotic pity, when they come a begging to parliament.

*O fortunatos nimium sua si bona noriat.*

It cannot be doubted that the public is in the habit of undervaluing its prosperity, and of thinking too meanly of its resources; because a portion of them never meets the general eye at all, but passes from hand to mouth, without first being dished out on the government table. This writer endeavours to infuse a rational confidence; to cast up stock for the nation on as favourable a footing as if the creditors were to be called together; to estimate our well-being by the weight of our burdens, and place, like caryatids, our perfection in our superfluity. For instance,

"The first point to be examined in this part of the subject, is the account of ships built and registered in Great-Britain, which Mr. Cobbett professes to have given in a complete state in his Supplement. But, without troubling our readers to refer to that work, we shall completely dispel all the apprehensions they may have been disposed to entertain, by quoting the following very short official abstract, signed by the register general, viz.

"That the average number of ships built and registered in the different ports of Great Britain in three years, ending 5th January 1793, was 618, and the amount of their tonnage 60,949. That in three years, ending 5th January, 1802, the number of vessels was 817, and their tonnage 103,071. And that in the year 1802, the number of vessels was 907, and their tonnage 104,789."

"We could here, if it were necessary, pursue the comparison further, by examining the accounts of the different ports; but we

think it will be more satisfactory to observe, that the number of vessels belonging to the British empire, which, on the 30th of September, 1801, amounted to 19,772, their tonnage being 2,037,000, and the number of men employed 143,987, had, in the year 1802, increased to 20,060 vessels, 2,078,561 tons, and 152,269 men, although the returns are stated to be incomplete. But Mr. Cobbett observes, that 'an account of the number of men and tons of shipping in the merchant service, sailing inwards and outwards during the aforementioned years, would have been more satisfactory, particularly if made up with a due regard to the spirit of truth; but, as no such account has yet been presented, we must, for the present at least, look upon that which we have just examined as containing a proof of a small positive decline, and of a very considerable comparative decline, in the mercantile marine of the country.'

"As Mr. Cobbett must have known, long before his letters were reprinted, that such an account had been presented in the usual regular and official form, we must suppose that he objects to it as wanting perhaps that 'spirit of truth' which so evidently characterises his own publications. We shall, however, take the liberty to state the result.

"In the year 1802, the number of vessels and their tonnage, which entered inwards and cleared outwards, was as follows, viz.

"Inwards, 17,355 vessels, 2,273,594 tons.

"Outwards, 16,364 vessels, 2,087,789 tons.

"Whereas in the year 1801, as may be seen by a reference to the accounts for that year, they amounted only to 15,844 vessels, 2,158,775 tons, entered inwards; and 15,908 vessels, 2,150,501 tons, cleared outwards."

When one considers the easy taxability of the rent derived from all this shipping, and of that yielded by our lands, houses, machines of manufacture, and canal-craft; when one considers that coals, cattle, and many other objects of popular consumption, are not yet touched by the Midas fingers of the chancellor of the exchequer; when one considers that a land-tax, co-extensive with the whole mass of our colonial possessions, would be but a just retribution for the utility of our protection,—one is tempted to suspect that taxation is yet in its infancy, and that the sprawling arms of the full-grown giant will at once open loans in Calcutta, and budgets at Surinam.

**ÆT. LI.** *A Supplement to a comparative View of the Public Finances: containing an Account of the Management of the Finances to the present Time.* By W. MORGAN, F. R. S. 8vo. pp. 114.

THE financial writings of the acute and accurate Mr. William Morgan, which comprehend so admirable an hostile criticism on the conduct of Mr. Pitt, during his chancellorship of the exchequer, are here continued to an advanced period of the administration of Mr. Addington. They prove, that a precisely analogous system of management still prevails; and that whatever grounds of alarm or admiration justly operated before, are still entitled to agitate or tranquillize the attentive public. It appears to us, that Mr. Morgan appreciates, very equitably, the amount of the national incumbrances, but that he somewhat undervalues the national resources. Mr. Pitt's errors were chiefly two. During peace, he always endeavoured to raise the funds, by overstrained statements of the produce of the revenue; whereas he ought then to have depreciated them, in order to accelerate the extinction of the debt. During war, he often attempted to raise the supplies within the year; whereas a bolder system of borrowing, and a more lenient system of taxation, would have interfered less sensibly with the comforts of the people; and his loans, instead of being made in a five per cent. stock, redeemable at par, were mostly made in a three per cent. stock, likely to rise on a peace greatly above sixty, and thus to cost, for its redemption, vastly more than the capital advanced. An active attention to prefer those forms of taxation, which, like the land-tax, are reconvertible into capital, is another very important duty of the minister of finance; but the structure of our two houses of parliament renders the taxation of fixed property more difficult than it ought to be. The expenders of rents are the most unproductive and useless class of citizens; their income is a fairer object of erosion, than that of the industrious, commercial, productive, or useful classes.

The concluding paragraphs well merit the serious attention of every friend to British prosperity:

"It was my intention to have proceeded further with this subject, as well as to have noticed several other particulars connected with the present management of the finances; but the nation is involved in another

war, and these, though in themselves very serious evils, are now rendered matters of comparatively little importance. The income tax, and all the other dreadful auxiliaries which the late minister successively tried to no purpose, are united in one general mass, and, as if his successor wished to exceed even the boldest of his attempts, the funds themselves are to become an object of taxation. If the war begins with an attack so direct and undisguised, upon all public faith and security, what limits shall be prescribed to the sacrifices which may be demanded during the course of it. But here I shall drop the subject. Having completed my account of the finances to the conclusion of the late war, and of the truce which succeeded it, I shall leave others to pursue the discussion through the present contest.

"In all my publications on this subject, it has been my earnest endeavour, as far as lay within my abilities, to warn the nation of the danger to which it was exposed, from the extravagance and profusion which have dissipated the public treasure:—and feeling, as I do, an ardent wish for its welfare and happiness, I am grieved to think of how little avail every effort has proved to check the growth of an evil which increases the distress, and must terminate in the ruin of the kingdom. As I have already observed, the indifference of the nation in a season so big with danger, is truly awful and astonishing. Incumbered with a debt of more than five hundred millions, and just soothed with the hope of emerging from a war the most expensive and sanguinary, we can behold ourselves deprived of this hope, and plunged at once into another war, more dreadful and ruinous, without the slightest murmur of apprehension or discontent. Whether the present be a just and necessary war, or not—whether it arises from the inordinate ambition of one party, or the wretched incapacity of the other, the consequences must be equally fatal to the credit and resources of the country. So long as the annual expenditure requires fifteen or twenty millions to be raised over and above the annual income, the pressure must at length accumulate till it exceeds the strength to bear it. The expedients which have been once tried without success for raising the greater part of the supplies within the year are again proposed, and will probably be adopted. But this attempt to relieve posterity by increasing the present burthens—to raise a sum sufficient for discharging the principal, when it is hardly possible to provide for the interest of the debt, is absurd and imprudent in the highest degree, and can only serve to hasten the catastrophe which it is designed to prevent. The public, however, in their present state of insensibility, rather than

be awakened by a sense of their danger, may choose to confide in such expedients, and to suffer themselves to be lulled into security by florid declamations on the commerce and opulence of the country. Under these circumstances, it will be lost labour to reason and expostulate. But the period must come

when this delusion will vanish away, and we shall be convinced by dire experience, that neither the prosperity nor even the existence of a nation can ever be secure, unless firmly established on the foundations of peace and economy."

ART. LII. *Royal Letters. Correspondence between his Majesty, the Prince of Wales, the Duke of York, and Mr. Addington, respecting the offer of Military Service made by his Royal Highness the Prince of Wales.* 8vo. pp. 16.

IN perusing these letters there are three subjects that naturally present themselves for investigation. The first is the general question, whether in a government, constituted like the British, it is advisable that the heir apparent to the throne should be allowed to occupy a high military situation. The second relates to the particular subject of discussion between the prince of Wales and the king; and the third consideration is, how far it would conduce to the public good, if, in the present circumstances of the nation, the prince was appointed to a general command.

The idleness and dissipation of princes is a favourite topic of ignorant declamation: as if it were possible that a man, without professional employment, deprived, for the most part, of civil and political influence, and of the very highest rank, could avoid giving way, more or less, to that indolence and love of pleasure, from which nothing, but the necessity of active exertion and absence from the contagion of bad example, can secure even those who are the most carefully educated. The pursuits of literature, of natural and experimental philosophy, are by no means suited to be the favourite and habitual studies of a prince of Wales; they are neither connected with the art of governing, nor do they encourage those habits of activity in the dispatch of business, or that prompt decision which are so peculiarly valuable in the character of a sovereign. The want of responsibility disqualifies the heir of the throne for the exercise of any ministerial office, not to mention other equally strong objections: the only alternative left, therefore, is the army or the senate. It is not to be expected, and perhaps not to be wished, that the direction of the whole military force, or even a high independent command, should be entrusted by the sovereign to his future successor; nor is it likely that the prince should be satisfied with one considerably inferior to what, by his birth, he might seem to

be entitled; the business of an officer, also, during peace, is by no means sufficient to occupy the time duly and regularly; and the habits and avocations of a camp are but little qualified to teach that respect for the laws and civil authority, which ought to be always characteristic of a king of Britain. But in the regular and active discharge of those duties which his situation as a peer of the realm appears to demand, a prince of Wales may be both fully, usefully, and honourably occupied. The study and practice of eloquence, the investigation of general principles of policy, and their application to real life, are pursuits not only highly respectable, but strictly professional in the man who is destined by birth to fill the highest office in the state. Being possessed of no immediate patronage, his opposition could not thwart any wise and patriotic design of ministers, but would be a most valuable check upon any unwise or unprincipled projects. The proceedings of the house of peers would be viewed with more interest than at present, and their influence on the public mind would more nearly balance that of the house of commons. While the sovereign continued vigorous, and his ministers able, the weight of the prince would be comparatively small; as, on the other hand, in contrary circumstances, it would, as it ought to do, increase; and its advance or retrogression being visible to the nation, the improvement of the commonwealth must be the aim, and the public approbation the reward of both parties.

It appears from these letters, that the prince of Wales solicited the king in 1798 to be allowed to accompany the army on foreign service: this was refused, but a promise was made, that if any thing should happen at home, the prince "should be first and foremost." In consequence of this, his royal highness, upon the prospect of invasion, requested to be promoted in the army; naturally supposing that the heir to the throne was not in a situation to be "first

and foremost," while occupying no higher rank than that of a colonel of dragoons. This request was denied, because, according to the duke of York, it was expressly stipulated, when the prince received his regiment, that he should receive no further promotion in the army. This is denied by the prince of Wales, and here the matter rests for

the present. On these transactions we do not presume to give any opinion; but we think that the national interests are by no means endangered, in refusing to entrust the command of an army to an officer who has never had an opportunity of being engaged in actual military service.

ART. LIII. *Observations on the Temper and Spirit of the Irish Nation at the present Crisis.* By J. P. WINTER, Esq. 8vo. pp. 50.

THIS pamphlet is written with considerable elegance: our readers will be gratified by the following extract.

"Unfortunately there are men, whose chief object seems to have been to perpetuate discord; who, assuming to be themselves the support of government, have been at pains to deprive it of the support of millions. Yes, there are those whose loyalty is more fatal to the state than the treason of others. These men are not the advocates of power, that all may be secure under its protection; but they would fain ally themselves to power, that they may injure and defame with more audacity. In the midst of a populous nation, they have no country: they are but the members of a party. Reviling all who subscribe not implicitly to their opinions, continually repeating and perverting the tale of our calamities, they suffer not the better feelings of the country to prevail, and unite us together in amity. They seem fearful lest harmony and concord, established among all ranks and parties, should deprive them of their wonted gratifications, and, leaving them no object to vilify and insult, should leave their minds without occupation.

"Should any symptoms of discontent break out in the country, (and it is perhaps too much to flatter ourselves that there will be none) these men will immediately clamour for the adoption of the harshest and most violent measures, such as their intemperate zeal may dictate, and which shall give full scope to their vengeful passions. Let us, for the sake of the country and humanity, hope that their wishes will not be indulged, nor their suggestions listened to. It is undoubtedly reasonable, when the safety of the state is endangered, that the hands of government should be strengthened, and measures of additional security adopted. But there is a point, beyond which a just and honourable man will not go, even to protect himself from threatened destruction. These violations of order to preserve order; these outrages to restrain outrages; these short cuts of policy by which the innocent and the guilty are confounded, however they are pretended to be justified by necessity, do in fact originate in some vile and contemptible passion; in party rancour, which seizes the opportunity of gratifying its malignity, or in coward fear, which thinks every thing excused

by its apprehensions of danger. The man of true greatness of soul despises no less than he abhors them. He prepares such means of defence as justice and honour sanction, and waits the event with calm intrepidity. He maintains the justice of his cause with firmness and resolution, but, rather than stoop to be the doer of wrong, he prefers to perish.

"Nor is this character of magnanimity less wise, in the main, than it is humane and generous. It gives a lustre and respect to a cause, which do it much more effectual service than the dishonourable precautions of a timid or cruel policy; which virtuous minds participate in with reluctance, or keep aloof from with indignation.—It never surely can be the interest of a government to confound itself with the violators of law and the perpetrators of outrage. Thought it may be necessary it should unsheath the sword, it never ought to throw aside the robes of justice. When it appears disarrayed and divested of the sacred symbols of its rightful authority; when it enters the lists with its opponents in their own mode of warfare, and engages them with their own weapons, we are puzzled at the scene before us: we no longer recognize the depositaries of legitimate power and the public majesty; we see only violence and faction, and scarcely know where to fix our hopes, or whether any ground of hope remains. Such is the state to which a country is reduced by intemperate counsels; but let us trust that we shall never thus witness their fatal preponderance."

It ought to be the object of all political writers to define the remedies of the wrongs they state; to recommend mildness and conciliation is not enough. Will any thing, ought any thing, short of catholic emancipation suffice to give quiet to Ireland? What forbids this emancipation? Is it the bigotry of the church of England? Let the tolerant bishops be translated, and the liberal clergy patronized, until the literary tone of the body changes. Is it a conspiracy of orange-men? Let the public enemies be impeached. "The ancient encouragement (says Pym, in his admirable speech touching my lord of Strafford)

to men that were to defend their countries, was this, that they were to hazard their persons for their altars and hearths, for their religion and their houses: but by this arbitrary way that was practised in Ireland, and counselled in England, no man had any certainty either of his religion, or of his house, or any thing else, to be his own. But, besides this, such arbitrary courses have an ill operation upon the courage of a nation, by embasing the hearts of the people. A servile condition doth, in time, beget in men a slavish temper and disposition. Those that live so much under the whip and the pillory, and such engines of

torture as were frequently used by the earl of Strafford, they may have the dregs of valour, sullenness, and stubbornness, and revenge, which may make them prone to mutinies and discontents: but of those noble and gallant affections, which put men on brave designs and attempts for the preservation or enlargement of a kingdom, they are hardly capable. Shall it be treason to embase the king's coin, though but a piece of twelve-pence, and must it not needs be a greater treason to embase the minds of his subjects, and to set upon them a stamp and character of disaffection?"

ART. LIV. *Hints on the Policy of making a National Provision for the Roman Catholic Clergy of Ireland, addressed to J. Bagwell, Esq.* 8vo. pp. 48.

THE simplest method of making a becoming national provision for the Roman catholic clergy of Ireland, would be—to repeal the act of uniformity.

The advowsons could then be presented by catholic proprietors to catholic priests; and thus the established religion would, in the country, every where coincide with the actual distribution of property. In towns, the rights of presentation might be purchased by parishes; and an elective priesthood would thus arise, coinciding in religious opinion, with the population.

In Great Britain some changes of another kind would take place. The residual petitioning clergy would castrate their liturgies, to suit the modesty of their creed. The dukes of Grafton, and other socinian noblemen (if others there be), would be able to present their benefices to the unitarian clergy. The lectureships, and similar elective institutions in the large towns, could be contended for by calvinists, methodists, baptists, and others, who are now obliged to be separatists. Thus a practical comprehension of the dissentient sects would be accomplished in the established church: in other words, a co-establishment of all denominations would, by this easy process, be effected; and each sect would acquire a share or interest in the ecclesiastical property, exactly proportioned to its numbers and its opulence. No man would have been disturbed in his creed, or in his property. All would agree to differ about doctrine, and would unite about discipline or constitution. Consequently, the perpetuation of the national church, and not its overthrow, would shortly become the object of all

sects universally. This would perhaps strengthen the church too much for the convenience of the statesman; but it would secure a religion progressive with the culture of the community.

Our author's proposal is rather different.

"Let the roman catholic clergyman be appointed by and provided for by government, and you lay the foundation-stone of Irish prosperity, of true catholic emancipation."

He thus proceeds in the sketch of his plan:

"If government pay the priest, it is but just it should appoint him. As to mere questions of faith, I see no serious objections to their remaining in the hands of the *old lady*, who now appears to have lost every spark of that termagant humour which once made her so very formidable to her neighbours. The appointment of bishops should exclusively belong to government; that of priests, perhaps, may be subject to a modified approbation of the diocesan, who, in case of objection, should state the same to government, which might then finally decide. It may be right to consider each priest in the light of a vicar, and never to admit a curate but in case of necessity, to be first allowed by the bishop. Moderate stipends will suffice men professing a life of celibacy. Accumulation for the support of a family can never be an object with them; and the dread of indigence in the decrepitude of age may be guarded against, by admitting substitutes under certain regulations. In endeavouring to avoid the dangerous extremes of penury on the one hand, and of affluence on the other, it will be satisfactory to contemplate the happy result of the equal and moderate system established in Scotland; a system which diffuses social order, industry, and content over the bleak and barren hills

of the north. There, if I am rightly informed, the parish minister enjoys an income of about 100*l.* per annum. Were the income of the parish priest in Ireland to be fixed at 80*l.* per annum, it may be found sufficient to raise him above the contempt of poverty, and to supply him with those comforts and accommodations essential to the independence and effectual performance of his clerical functions. In great towns, where the dearness of provisions and house-rent make a greater expence necessary, it may be right to advance the income to 100*l.* per annum. With regard to the bishops, who doubtless would be men of respectability, their revenues, perhaps, ought not to be less than 800*l.* per annum. A minute accuracy is not necessary in a general outline of a plan which I shall offer, merely to show the easy practicability of the proposed measure. I have endeavoured to be as correct as my materials would allow; at the same time I consider the establishment of the principle the main desideratum. Agree to the measure, and the means will suggest themselves. There are in Ireland about 1200 parishes, including unions, which are no more than extensive parishes. Now the number of parishes, multiplied by a hundred, gives 120,000*l.* This sum, divided by eighty, the average income proposed for each priest residing in the country, leaves 24,000*l.*; a sum which may be found sufficient to pay the bishops, and such additional priests as may be judged necessary for the very extensive parishes or unions. Now, to raise this sum I propose that a tax be laid upon all

tythes, somewhat similar to the income tax, and to make up the deficiency by a rate on the neat or profit rent of land. Now, if 800 of the 1200 parishes be taken at 500*l.* per annum, a tax of 10 per cent. will give the sum of 40,000*l.* In like manner, if the remaining 400 parishes be taken at 800*l.* per annum each, they will give 12,000*l.* making together 52,000*l.*; which will leave the sum of 68,000*l.* to be raised by assessment, being 56*l.* for each parish—a very inconsiderable sum, compared to the poor-rates raised in the best-administered parishes of England."

This proposed taxation of the tythe will not be very acceptable to the established clergy; this poor's rate for the new priest will not be very acceptable to the parishioner; and the whole plan proceeds on the supposition of a rivalry or competition of religious in every parish. Why should the catholic priest stop at his ten per cent. on the tythe? Will not he perceive that it only depends on his zealotry and activity next to halve it? Let parishes be encouraged to buy in their advowsons, and let them elect teachers of any description: it is for the minority, if they choose a different faith, to provide for their own pastors.

It is much to be wished, that some person of weight in the religious world would formally propose a repeal of the act of uniformity.

ART. LV. *Hints for the Improvement of the Irish Fishery.* By GEORGE N. WHATELY  
8vo. pp. 45.

DICTYNNA, a nymph of Diana, in other words, an old maid, invented, if certain antients may be trusted, the art of making nets. She is said to have been beloved by Minos, the wise law-giver, and had temples on the shores of Crete. To Dictynna then the human race is indebted for that vast supply of food, and demand for labour, which derive from the use of the fishing-net; nor should the modern legislator omit to offer homage to her art, or to collect on the shores of his empire the establishments of her votaries.

It happens however that many things are needful to make fishing thrive, besides the good-will of the magistrate and the coasters. A country must have become very populous, for the contiguous district to consume what the coast can catch, at a price worth pursuing. Sannazarius nowhere describes fishwomen indifferent about what their wares will fetch. The market of a large luxurious town should be within reach.

If fish are caught for distant markets, and are salted up for exportation, the capital requisite to provide the work and warehouses, the barrels, and tackle, and shipping, is immense; and an established mercantile interest must pre-exist to forward every thing to its proper destination. How should these things be every where found in so rude and so unsettled a country as Ireland? Unless some evangelical christians will subscribe largely to buy in the produce of the fishery, and distribute it in gratuitous meals to any 4 or 5000, whom hunger, patriotism, or piety might convene, there is no prospect of an effectual demand. The artificial consumption of a catholic religion, which sets apart a hundred days in the year for the eating of fish, is not sufficient to overcome these natural disadvantages. Until capital be more abundant and more diffused, a St. Francis might plead for the improvement of the Irish fishery, and the fishes would hearken unalarmed.

One important use, however, is likely to result from directing to this branch of industry, the literary patriotism of the Irish: it will occasion the collection and preservation of much information concerning fishery; it will secure the record of much traditional experience. The produce of agriculture, on the same extent of surface, is said to have increased one sixth, since its practices have been published, commented, and compared: a similar result will be the consequence of disserting on *marine agriculture*. The migrations of fish along the eastern coast, now take place nearly a month later than they did fifty years ago; but every observation favours the suspicion, that the same precise degree of temperature attracts them to the old banks as before. The natural history of fish is an important study; it may be worth while to offer national premiums for catching certain useless fish, merely because they interfere with the multiplication of the useful kinds, as is done for wolves and moles.

The following is an important fact:

“The public is indebted for the introduction of the new mode of hake fishing by the trammel net\*, to Thomas Walton, esq. of Oyster-haven, near Kinsale. He conceived

it was practicable to invent an easier and more expeditious method of caption than by the customary one of lines. His reflection taught him to imagine, that the principle, on which the herring and mackarel nets are constructed, might be applied with equal success to the larger description of fish. He had a net so contrived, and the experiment surpassed his most sanguine expectations.

“The trammel in use is about 40 fathoms in length, and three in breadth with a mesh of five inches in diameter. Four of these nets, connected by a rope passing along the extremity of each, compose a set. This is sunk with leads to the bottom of the water. It is sustained in a perpendicular direction by means of corks affixed to the upper part of it. Thus, it arrests the progress of the fish, entangling by the gills and elsewhere, all those passing in its course, the smaller ones excepted. At each end of the connecting rope is fastened two heavy stones, which serve as anchors, besides two buoy-ropes, for the purpose of ascertaining its position.”

In the present circumstances of the occidental island, it would perhaps be most expedient to institute a society for piscatory information. The means of transplanting shell-fish to an adapted beach, or of alluring whales to an airy bay, may, step by step, be ascertained, and England learn from Irish observers to pasture new fishes on her shoals.

ART. LVI. *Essays on the Population of Ireland, and the Characters of the Irish.* By a Member of the last Irish Parliament. 8vo. pp. 51.

THIS valuable pamphlet comprizes two dissertations; the one statistical, on the population of Ireland; the other philosophic, on the character of its inhabitants.

The first is the more important essay: it displays greater research, and comprises more valuable information. The result of this writer's enquiries and speculations are thus tabulated.

“Assuming then that the people of Ireland amounted, at the beginning of the last century, to about one million, I find no difficulty in affirming, that on an average, since the year 1700, they have experienced an increase of one-fifth or thereabouts every eleven years; and that accordingly there were about

1,200,000	people in Ireland in 1711
1,440,000	- - - - in 1722
1,728,000	- - - - in 1733
2,073,600	- - - - in 1744
2,488,320	- - - - in 1755
2,985,984	- - - - in 1765
3,583,174	- - - - in 1777
4,299,808	- - - - in 1788
and 5,159,769	- - - - in 1799

“I would not, however, be understood to affirm that the increase of people in Ireland

was uniform throughout the course of the last hundred years. I have sufficient reason for suspecting that it was less remarkable for celerity towards the commencement, than towards the middle of the last century. I know that it was considerably retarded, during some of the above periods, by excessive emigrations. And I perceive ample grounds for entertaining an opinion that it has been much more rapid since 1777, and infinitely more so since 1785, than it was at any period anterior to the former year. The foregoing table therefore is not offered as an accurate exhibition of the periodical numbers of people in Ireland, notwithstanding its general and striking coincidence with the different computations that have been made; but merely as a useful guide, which certainly will not lead us beyond the truth, in our reasonings on the population of that country, so long as the political circumstances thereof continue in their present posture.

“According to Mr. Bushe's computation, which is now universally relied on, and which first served to dissipate a very great, and perhaps dangerous error, with regard to the subject on which I am writing, there were 4,040,000 inhabitants in Ireland in the year 1788. But that gentleman's computation probably falling short of the truth, as

\* It is not absolutely a trammel, although general report has given it that appellation.

is likely to be the case with most computations of a similar nature, grounded on taxes, and as indeed he himself expressly apprehended, we may take a medium between his statement and that in the table, and safely venture to affirm, that the number of people in Ireland, in the year 1788, was about 4,169,904.

“By the table it appears, that in the year 1799 there were about 5,159,769 people in Ireland. And it being a fact, ascertained by a variety of coincident circumstances, that the increase of houses from 1788 to 1799 was not merely equal, but greatly superior to that from 1777 to 1788, which last Mr. Bushe tells us was 178,058, we are thence abundantly warranted in inferring that there were at least 5,078,348 inhabitants in Ireland in 1799; the demonstrable excess of increase during the former period, beyond that of any preceding one, being more than sufficient to cover the loss incurred by the late rebellion. Or taking a medium, as before, between these two statements, consonantly to Mr. Bushe's sentiments, we may distinctly affirm that Ireland did contain 5,119,508 inhabitants in the year last-mentioned. And to exhibit the subject in a relative point of view, we may add, that the population of Ireland is actually superior, in point of density, to that of England; there being, according to Mr. Templeman's survey, 27,457 square miles in the former, the population whereof, including the increase by generation from 1799, does at present stand at about 5,497,500, giving about two hundred persons to every square mile; and, according to the same survey, 49,450 square miles in the latter, the inhabitants whereof, making suitable allowances for omissions in the late return, certainly do not exceed 9,444,950, giving about 191 persons to every square mile, or nine less than in Ireland.

“Were it necessary to have recourse to collateral proofs, in order to evince the rapid increase of people in Ireland, a very admissible one might be drawn from the importation of coals.

“In 1727 there were imported about 70,000 tons; in 1764, 161,970 tons; and, on an average of three years, to 1799, to the value of 822,583l.”

It is not easy to persuade any nation that it gains by being judiciously taxed; and least so the very poor people of Ireland. Yet the fact is confirmed by universal experience. Taxation raises the price of spirits; suppose at the same time that it commutes part of the price of tea for a duty on windows. What is the consequence? The numerous classes are immediately reminded, that it is become expedient for them to employ less of their wages than before in the purchase of spirits, and more in the purchase of tea. Tea is drunk at home, spirits at the gin-

shop. Hence an increased habit of domesticity sets in throughout the families of the poor. Tea requires a little apparatus of kettles, and cups and saucers. Hence an increased consumption of pottery, &c. by which the manufactures are benefited, and a greater habitual capital becomes vested in furniture: by which means the love of home, the fear of the workhouse, and the means of obviating a sudden pressure are all augmented. The worst taxes are probably those which endear objects of necessary popular consumption, as taxes on soap, candle, and sugar. Yet even these taxes, by raising the price of commodities, which must continue to be distributed in the same profusion, increase the returns of all the dealers in such commodities, and of course their gains. Those consumers, who are chapmen, or who let their labour, make fresh contracts for their wares, or their toil, and the eventual sufferer by such taxes is the idler, who lives on his rents, and whom it is an object to stimulate into employment. Taxes increase circulation, and circulation is the nourisher of every form of prosperity. To create and to destroy, to produce and to consume in the greatest possible quantity, is the highest perfection of commercial community. Philosophers and paupers, who lead lives of privation, who have the fewest wants, and who accomplish the least expenditure, are the worst citizens of the commonwealth of industry.

In discussing the national character of the Irish, our author does not do sufficient justice to their placability. Warm as their bursts of indignation may be, their reconciliations are so too; and a government, which has recently quelled a rebellion, might with a few concessions rely on a glow of allegiance. Why not encourage the Irish to form volunteer associations? Pay their poor for coming to drill. Let them elect their own officers, and that annually. To these officers let government allow a liberal income. It would thus both know and conciliate the individuals on whom the obedience of Ireland depends; and it would find the voluntary conversion of volunteers into regulars very easy in a country, where the commercial and settled classes are disproportionately few, where courage and enterprise abound, and where a hardier education peculiarly adapts the multitude for the life of the camp.

**ART. LVII.** *An Investigation into the Principles and Credit of the Circulation of Paper-money, or Bank Notes in Great Britain; as protected or enforced by Legislative Authority, under the Suspension of Paying them in Cash; in the Extent of such Paper-money, the Responsibility attached to it, and its Effects upon Prices of Commodities, individual Income, Agriculture, Manufactures, Commerce, and upon the Course of Exchange with Foreign Countries. Together with a Discussion of the Question, whether the Restraining Law in favour of the Bank of England from paying Notes in Money ought or ought not to be continued as a Measure of State?* By WILLIAM HOWISON, Esq. 8vo. pp. 75.

FORGETFUL of the old proverb, 'that good wine needs no bush,' Mr. Howison has given us an explanatory title page, in which he has taken care to omit no subject which is discussed in his pamphlet.

The restriction bill, and the general principles of banking, have of late received a very ample and acute investigation from various quarters; as we stated our opinion at large on the nature of paper currency in our review of Mr. Thornton's "Enquiry, &c." (See Ann. Rev. vol. I. p. 384.) we shall not repeat it here. Mr. Howison feels very sensibly the general alarm on the present almost unlimited extension of paper credit, and reasons forcibly on the impolitic annulment of that law of William and Mary which prohibited the bank from advancing money to government, except on the credit of parliament. The restriction bill, if intended to be permanent, or even of indefinite duration, is severely to be reprobated: so long as it remains unrepealed, indeed, every bank of England note is stamped with a deliberate lie upon its face. The measure, however, from the circumstances of the country at the time of its enactment, was generally thought to be necessary, and therefore it was defended. The subject cannot long lie neglected: it must come before the public again, and it will be discussed with a judgment matured by time and sanctioned by experience.

The following passage will suffice to

shew the style in which these remarks are written:

"In the intercourse betwixt foreign countries every advance upon commodities must either be repaid in the course of exchange, or discounted on the price on going out of the country in which it is produced. For in as much as the money in any country is depreciated, the goods or merchandise of any other country sold to it, will be just so much raised in price on entering the country.

"Excessive circulation of bank notes beyond the only possible criterion, their convertibility into gold, which the restraining law has done away entirely, would, from the preceding observations, so far as they may be just, appear to be attended with much injury to the community at large in various respects; more particularly, first, in bringing the public under contribution of an annuity to the banks of a million and a half, equal to the interest of thirty millions of estimated circulating paper, without any value whatever—this sum in real money formerly would have been equal to the expence of a campaign in war: secondly, in the diminution of the fixed income of every individual in the state, of one half, or at least of a third; and of course in a proportional deprivation of his comforts; thirdly, in increasing the difficulties to agriculture, to manufactures, and to commerce, by enhancing capital and interest employed in them by raising the prices of labour and commodities, and by diminishing the consumption; fourthly, in increasing the evils of an unfavourable course of exchange with foreign countries: and finally, in laying the foundation for, and leading directly to a general explosion of all confidence founded on paper credit; and which may be attended by the ruin of many individuals at least, if not by public confusion."

**ART. LVIII.** *Thoughts on the Restriction of Payments in Specie at the Banks of England and Ireland.* By LORD KING. 8vo. pp. 106.

WHETHER Lord King has yet acquired that celerity of thinking, which enables him to deliver off hand the inferences of his judgment, we know not. The speeches attributed to him in the papers, however honourable to the state of his acquired information, did not impress that degree of admiration which his written treatise is adapted to secure. Were Mr. Pitt to attempt so lucid a state-

ment of the topics here discussed, he would most probably fail in the work. Perspicuity, precision, and that decidedness of practical counsel, which always accompanies clearness of intellect, are not apparently within his competence. But in Lord King's they are: and as this nobleman's views in finance are not at present inflected from the line of duty by any ambitious considerations of per-

sonal expediency; by any disposition to prefer the interests of monopoly companies, of powerful combinations, and of leading individuals in the money-market, to those of the unprivileged, independent, and in the aggregate far more important commerce of the country, it would be reasonable to expect from his superintendence a wiser conduct of the exchequer. A pamphlet is the form in which a man of intellect may most unaffectedly advertise his power of mind, and his comprehension of science: it is then for his country to remark his expedient destination, and to invoke at the appropriate emergency his aid. Lord King ought to be heard in his own words.

“It must however be evident, that the advantages which thus result from the use of a paper currency depend altogether upon the fact of its exactly supplying the place of that coin which it represents; and this quality can only be possessed by a currency which is immediately convertible into specie at the option of the holder. So long as this power of conversion continues, the notes in circulation must be considered as equivalent to specie; since they exist only by the choice of the public, who, if they preferred gold and silver, might immediately receive them in exchange. But when the obligation to pay in coin ceases, the currency no longer retains this determinate value, but whatever may be the credit or solvency of those by whom the paper is issued, it becomes capable of being depreciated by excess of quantity. That the power of immediate conversion into specie is the only circumstance which can prevent this excess, or maintain the value of any paper currency, is practically shewn by the occasional discount upon exchequer bills and other government securities bearing interest, of which the payment is ultimately certain. A currency exposed to such fluctuations must evidently be a very unfit medium of exchange or standard of value.

“As all paper credit depends essentially upon confidence, it is one of the evils of the system to be exposed to great derangements in consequence of panics which produce runs, or sudden demands for cash, upon the banks which issue the paper. It now appears that for some time prior to February 1797, and indeed during the whole of the year 1796, the bank of England had been labouring under difficulties originating in an unfavourable exchange, but which were much aggravated by an extension of its issues to government, and an increasing demand for specie occasioned by public alarm. In consequence of this demand the directors found it necessary to diminish the issue of their notes, which in the beginning of the year 1797 were reduced from the average of be-

tween ten and eleven millions to nearly eight millions and a half. Had confidence been speedily restored, this reduction would probably have enabled them to survive the danger. But the executive government having, for some reasons, thought it necessary to express their apprehensions of an invasion, and to take measures of precaution against hostile attacks, a general panic ensued, and a demand for specie from all parts of the country was made upon the bank of England. This brought affairs to a crisis: and the 25th of February 1797 the directors represented to government their inability to perform their engagements to their creditors, and their apprehension that, unless some immediate step was taken for their relief, the bank would be exhausted of the whole of its cash.

“In this new and difficult state of things it is an important question to determine what is the system of conduct which true policy would have dictated. In cases of private commercial establishments of acknowledged solvency recourse is often successfully had, upon such occasions, to associations of the principal creditors. It seems highly probable, that a similar measure would, in this instance, have been attended with similar good effects; and that the impending danger might have been prevented by an association of the merchants and bankers of London to support the credit of the bank, which would have been followed by other associations in all the great and commercial towns. Engagements of the same kind might have been entered into by the individuals of both houses of parliament, grounded upon such inquiries into the solvency of the bank, and the causes of its failure as those which in fact took place.

“If a positive law for the suspension of payments had been found unavoidable, it should have been limited to a peremptory time, under the most solemn parliamentary engagement that it should not again be renewed; and immediate provision ought to have been made for answering the demands of the public for gold by a new coinage to a considerable amount. Such a measure could not have been attended with any serious difficulty or expence; but had it even occasioned some degree of embarrassment, yet no sacrifice was too great for the support of commercial credit and national faith; and some struggle for such important objects might surely have been expected from that financial courage and fertility of resources, which upon occasions of a very different nature distinguished the measures of the late administration.

“Instead, however, of trying the effect of these natural and obvious remedies, recourse was at once had to the most violent means. An order of council was issued on the 26th of February for restraining the bank from payments in cash; and the restriction was confirmed by an act of parliament, which was afterwards renewed during the existing session.

"The bank of England usually issues its notes by discounting bills of exchange to merchants; and it has been supposed that, providing the bills are not fictitious, but relate to transactions between real debtors and creditors, the paper money which is thus issued can never exceed the amount which would necessarily circulate if the obligation to pay in specie existed. But the occasional convenience of the merchants has a very remote connection with the permanent demands of the public. Though we should suppose the bank to possess the means of distinguishing in all cases between real and fictitious bills; yet transactions may pass between individuals, and payments may be made by bills of exchange to a large amount, upon occasions and for purposes which have no reference to the number or amount of such transactions in the community at large. But it is certain that the directors of the bank have no such power of distinguishing between bills of different kinds; and that, in any general system of discounting, they must be liable to be imposed upon by what are called bills of accommodation. This uncertainty would occasion great difficulties and constant errors in the use and application of any rule for the regulation of currency founded upon the calls of the merchants for discounts.

"But a single instance of a great demand for discounts clearly unconnected with a general demand for currency may at once convince us that the rule itself has no just foundation. By the impolitic restrictions of the laws against usury, the bank of England, like other lenders, is prohibited from receiving an interest upon its loans of more than five per cent. But it may often happen that the rate of mercantile interest, and even that of government securities, exceeds this sum. Under such circumstances the merchants have a strong inducement to obtain money upon loans from the bank; and the demand for discounts in consequence of this inducement may be carried to any assignable extent. Demands originating in such causes have in fact frequently taken place at different periods during the late war; and the contrary effect of a diminished demand would naturally be produced by times of peace and prosperity when the rate of interest is low. Yet, at these periods, in which commerce is most flourishing, the currency and circulation of the country would naturally be the greatest.

"In real practice, it is well known that the directors of the bank do not consider the number or amount of good bills presented to them for the purpose of being discounted as furnishing the rule by which the amount of their issues is to be determined. Even since the period of the restriction, they have, on various occasions, thought it necessary to narrow their discounts. They are understood to give a certain limited credit to all the considerable bankers and merchants; and to discount for each a certain proportion of bills according to the extent of his credit.

But so long as there is no obligation to exchange their notes for specie, it is evident that this proportion must be altogether arbitrary, and dependent upon the will and pleasure of the directors, not upon the actual wants or demands of the community.

"Some persons have thought, that the acknowledged solvency of the bank of England, and its ample sufficiency to pay the amount of its bills in circulation, are an abundant security against an excessive issue of paper; or at least that no danger is to be apprehended while the currency is confined within these limits. The fallacy of this opinion may be very easily shewn. It is perfectly obvious, in common cases, that the amount of a banker's capital, and his power of raising money, afford in themselves no proof or presumption whatever that he has the means of carrying his circulation to the same extent; and it is impossible to distinguish between the case of a common banker and that of the bank of England. A rule of limitation, therefore, founded upon the principle of solvency, would be still more inaccurate than a rule founded upon the demands of the merchants for discounts. By additional subscriptions the capital of the bank of England and the amount of its property are capable of being augmented to an indefinite extent; but no one will therefore contend that the national currency could be extended without limit, or that it would admit of any considerable increase without great depreciation. Of all possible securities for money the security of government has always been considered as the most solid and indisputable; yet navy and exchequer bills are often brought to a discount by excessive issues; and it is known by experience to those persons who conduct such financial operations, that no quantity of these securities can be forced upon the market beyond its actual demand, without producing a reduction in value.

"A mixed consideration of the price of bullion and the state of foreign exchanges would probably be the best practical rule by which the directors of the bank, during the suspension of their payments in cash, could regulate the issue of their notes; yet, in consequence of the irregularities which will hereafter be shewn to be produced by the balance of trade, it would on some occasions deviate from the true standard. But, whatever may be the principle by which the directors, since February 1797, have limited the issue of their notes, the following observations will prove that they certainly have not adopted this rule: though it is highly probable that a general consideration of the price of bullion and of the rate of exchange may have served to guard them against a flagrant and impolitic abuse of their powers.

"If the above reasoning is well-founded, it must follow that there is no method of discovering *a priori* the proportion of the circulating medium which the occasions of the

community require; that it is a quantity which has no definite rule or standard; and that its true amount can be ascertained only by the effective demand. In countries where the currency is carried on by the precious metals, the quantity is regulated, as in all other cases, by the skill and attention of individuals who are versed in this particular branch of trade; or, in other words, by the bullion merchant, who, in case of a redundant currency, withdraws the excess from circulation, and employs it in foreign commerce, or, in case of a deficiency, procures a new quantity of the metals to be converted into coin. Where the currency consists of paper convertible into specie, the excess or deficiency is in the same manner prevented by the demand of the public either for cash or notes as circumstances may require. A paper circulation which cannot be converted into specie, is deprived of this natural standard, and is incapable of admitting any other. The persons to whom the duty of regulating such a circulation is entrusted are in danger, with the very best intentions, of committing perpetual mistakes. The greatest possible degree of skill and integrity can only protect them against gross errors. They will not probably in one instance be exactly right.

“That the experience of the officers of the bank may in some respects have furnished them with the proper skill and knowledge of the regulation of such a currency (if it ought in any case to exist) it would be injustice to deny; but it may very reasonably be doubted, whether they possess sufficient firmness for the proper and independent exercise of so important and difficult a trust. Whatever respect may be due to the characters of the directors as individuals, it is impossible, after the transactions of 1796, to acquit them of blame in their corporate capacity. During the present restriction of payments in specie they are obviously exposed to great temptations. Political influence may occasion an improper increase of their accommodations to the executive government; and their direct interest in the profits made by the bank furnishes a constant inducement to the extension of their notes beyond the proper limits. It is the object of the following pages to shew, from indisputable facts, that there are strong reasons for believing that the directors of the bank of England, and, in a still greater degree, those of the bank of Ireland, have in

reality yielded to these temptations, and that they have made an undue and improper use of the powers intrusted to them by Parliament.”

It deserves notice, that in 1797 the circulation of English bank notes usually amounted to ten or eleven millions only: and that this circulation now amounts usually to fifteen or sixteen millions. The bank therefore circulates half as much again, in consequence of having obtained the patent for not paying in cash. The profits on an additional circulation of five millions of capital amount, at five per cent., which in discounting is the usual rate of interest, to two hundred and fifty thousand pounds yearly. It would be reasonable, that the bank should allow the country half this gain, as an indemnity for the risk which our whole public prosperity runs by tolerating the privilege. The bank would thus have to pay out of its profits, one hundred and twenty-five thousand pounds yearly in the form of a tax. Ministers have committed a dereliction of public duty in not obtaining some such allowance. A circulation adequate to the wants of London could probably not be furnished by any individual company, without the privilege of withholding specie. Were there no bank of England, but instead of it a great number of private banks, the circulation would indeed always be proportioned to the effectual demand. Where, on the contrary, there is only one company, panics may annihilate at once the only circulating medium, and withdraw exactly when it is most wanted, the whole pabulum of commerce. Against such panics the restriction is a real protection. So long as the system of a monopoly-bank is entitled to endure, so long probably it will be found expedient to tolerate this portentous restriction, which embarks, on the reputation for solvency of one institution, the solidity of all the forms of metropolitan trade.

ART. LIX. *Remarks on Currency and Commerce.* By JOHN WHEATLEY, Esq.  
8vo. pp. 268.

THE art of book-making improves by practice. It was formerly expected from an author, that he should collect his materials and draw his inferences in his closet, and present the result of compared facts and antagonist arguments to the public *after* the investigation.

But now, the opinions intended to be maintained, are first announced in a crude pamphlet, then corrected into consistency by help of the hostile commentaries of reviewers, and finally garnished with such corroborating facts, as a few years of desultory reading cannot

fail to supply. Thus the Baconian method of philosophising is precisely inverted: instead of taking our conclusions from experience, we take our experience from conclusions, and invent a mass of *à priori* opinion, which Aristotelic philosophers would denominate truth.

We are told in the preface, that these remarks on currency and commerce are offered to the public, more as the prospectus of a future work, than as a distinct treatise in its present shape. They are subdivided into six chapters, of which the first proposes to demonstrate, 1. That an increase of the national stock of specie is an increase of currency, and not of capital; 2. That an increase of currency, is not an increase of wealth; and 3. That no one nation can possess a greater relative currency than another. The second chapter treats of the balance of trade; the third on commerce; the fourth on the depreciation of money; the fifth on the reformation of the paper currency of this country; and the concluding chapter, on the reduction of the national debt by the depression of money.

It is to the fifth chapter of this work that the public attention ought principally to be drawn; because the author has there ventured to found on theoretical principles, often equivocal and sometimes unintelligible, a most important and most dangerous practical counsel. In a season of alarm like the present, under ministers like the present, rash counsels may find admission; and the slowly accumulated prosperity of centuries may be annihilated at a blow. This author contends for no less than the total suppression of the country-banks; and for conferring on the bank of England a monopoly of the whole paper-circulation of Great Britain. We shall extract this prodigious speculation.

“In this review, I shall endeavour to prove that the paper of country banks must ever form an inefficient and dangerous medium of circulation, from its liability to sudden contraction in the period of alarm; and its tendency to as sudden an increase in the moment of security; and that its continuance is inconsistent with the stability of the national bank, and the general interests of the country.

“Between the termination of the American and the commencement of the late war, country banks were instituted in all the principal towns of the kingdom; and up to the year 1793, their notes had a free and easy circulation, without exciting much public

uneasiness; though the bank entertained an early prejudice against them, from the difficulties which were likely to ensue to their own establishment. Upon the breaking out of the war, and the first tendency to alarm in the public mind, their stability was put to the test. The mere agitation occasioned by such an event, was sufficient to excite a suspicion of their credit: and, when once excited its suppression was impracticable: though at first partial and insignificant, it spread with irresistible rapidity, and increased in force as it increased in extent. The greater part of their notes was instantly contracted, and the currency of the country was reduced to such a degree, as to cause the utmost distress from an insufficiency of means to effect the customary payments. It is impossible for me to calculate the quantity withdrawn from the purposes of circulation: but I should not think that the reduction would be overstated at three millions. This sudden contraction of so large a proportion of our circulating medium, necessarily disabled the fulfilment of engagements, and produced an extent of calamity unparalleled in the history of this, or any other country. No less than one thousand three hundred and four bankruptcies were the consequence of the reduction.

“In this crisis, they made application to the bank of England for relief. But as the directors were alarmed at the difficulties that threatened their own institution, from the preceding issue of their paper, assistance was refused. The metropolis soon became distressed in the same proportion with the country towns; as great part of its currency was withdrawn to fill the chasm which had been made in the currency of the other parts of the kingdom. The mischief, already extensive beyond all former precedent, was likely to be productive of still greater calamity, had not government interposed to arrest its progress: the issue of exchequer bills was peculiarly necessary at this juncture, they provided the country with its due proportion of currency, and prevented any further extension of the mischief.

“Though many country banks escaped without injury in the general shock, yet none were free from alarm. None could tell how soon the blow might be repeated, nor what degree of injury it might be capable of effecting. As soon as the public consternation subsided, they took the only means in their power to provide against the evil which might result from its return, by securing a connection with the London bankers. By this connection, they were enabled to procure the support of the bank of England, notwithstanding its repugnance to assist them. Though, previous to the suspension of cash payments, no private London banker applied for assistance in his own name, as the application might have been deemed a reflection on his credit; yet assistance was easily procured, by requesting his customers to send

bills in theirs to be discounted for him. By this intermediate agency, the London bankers were capable of extending the loans of the bank to their country connections, and of giving them that support which had been refused to their direct application: they thus secured to themselves the power of offering a certain quantity of bank notes, or specie, upon any sudden aspersion on their credit.

“In the year 1797, another alarm gave rise to another suspicion of their stability. But by the measures which they had taken, the press was in reality directed against the bank of England instead of themselves. Immediately that a run was made upon them, a drain was made upon the bank for specie through their London connections, and vast sums were remitted for their support. In proportion as the alarm became prevalent, and paper became contracted, specie was the more and more demanded to supply the vacuum. The bank, apprehensive of being exhausted of its deposits, pursued its accustomed policy, and reduced the amount of its notes. By this diminution it augmented, in a greater degree, the general distress, without any relief to itself, as the smallest quantity of paper which it continues permanently in circulation would be sufficient, by frequent exchanges, to draw out any given sum of money, and eventually to drain it of its stores. As this policy, therefore, had no other effect than to aggravate the evil which it was intended to remedy; and as, by an increased demand for specie, great danger existed of a total privation of its deposits, it was reduced to the necessity of applying to government for support, and suspending its cash payments. But no blame is imputable to the directors; they found their house involved in difficulties by no imprudence of their own, and adopted the line of conduct which existing circumstances, in their opinion, demanded. No doubt whatever can be entertained, but that the order of council was necessary at the time to prevent worse consequences.”

After some pages more of similar reasoning the author thus continues

“In order, therefore, to obviate the danger which threatens the bank of England upon a return of cash payments, and to prevent the probable recurrence of the calamities of 1793 and 1797, it appears to me absolutely necessary, that the circulation of country notes should be prohibited.”

The facts adduced in this whole passage are most unfairly related. There were great failures at the beginning of the anti-jacobin war. Whence did they arise? A war always throws a great mass of capital into a new direction; there

is a sudden progressive absorption for the public service, and a sudden speculative investiture in naval stores and other new objects of demand; of course many applications for payments are made at once pressingly and peremptorily in the commercial world. Whoever finds it difficult to be punctual becomes a marked man; whoever is really insolvent is at such times compelled to the acknowledgment. The war of 1792, terminated a commercial treaty which had introduced British manufactures to every corner of France: of course the intercepted masses of capital much belonged to merchants trading with the French ports, and to manufacturers who directly supplied the store-keepers of France. Manufacturers for the foreign market are usually principal creditors of the country-bankers: they can circulate much paper in the payment of their dependents, where they make it an object; and a banker willingly proportions the credit given, to the consumption of his paper. The country-bankers therefore were much inconvenienced by the diminished command of capital among the manufacturers, and endeavoured to get advances of their regular correspondents—the London bankers. On a system of open banking, this could easily have been accomplished; the houses in credit would have issued a greater quantity of notes, and have discounted the circula-ble securities of their provincial friends. But the bank of England, possessing in London a monopoly of discount, and wishing to employ its own capital rather in government securities than in private accommodation, refused to discount for the London bankers with the increased facility, which the provincial demand for capital required. The bank of England even narrowed its discounts at that time; and thus inflicted, in reality, much of the commercial embarrassment and misfortune of 1793. During the subsequent difficulties of the West India merchants, similar evils arose from the monopoly-bank, and government had to advance the defective capital in a manner very favourable to the corruption of mercantile political opinion; but very dangerous to the property of the nation, very hostile to the inculcation of prudence, and very needless and inexpedient on a system of open banking.

ART. LX. *A brief Treatise on the Law relative to Stock-jobbing, and other Transactions in the Public Funds. By I. J. BURN, Solicitor. 8vo. pp. 96.*

THE theorists, who have best discussed the doctrine of circulation, are accustomed to denominate that circulation useful, which adds a value to the commodity transferred; and that circulation noxious, which expends unproductively the labor and venture of transfer, and leaves the commodity transferred in its pristine state. Those who speculate in bullion, in cochineal, in corn, may gain or lose much by a fluctuation in the price of their purchase; but they restore it to the consumer unaltered; no addition of labour is consolidated with its value: it might as well have wandered to the goldsmith, the dyer, or the miller, without mediation, and have escaped the chance of an intervening rise or fall. It is probable, however, that such speculators find usually a profit accruing; they would not else invest capitals, which might quiescently produce an interest; they consequently tend to enhance the price to the ultimate consumer, and thus offer a bounty to the original producer. They stimulate the miner at Santafé, the nopal-gardener at Quito, the farmer on the Delaware, to increase his produce; and by securing a more abundant growth they eventually indemnify, and more than indemnify the consumer, for the added cost of his present purchase. But no apology of this kind can be devised for the speculators in the stock-market: the commodity is increased or diminished by war or peace, not by the value they withdraw or confer: the time, the capital, the intellectual effort they employ is all withdrawn from productive industry and expended on barren gambling: and the rank and comfort of innumerable families is staked on the caprice of a cabinet, or the arrival of a courier. Even Professor Büsch (Von dem Geldsumlauf; book III. section 43) who approaches Mandeville in the conviction, that whatever is, is right, declares against stock-jobbery, as he calls it, and pronounces it to be completely hurtful. Under this impression a law was made in the 7th year of George II., that all contracts made after the 1st June, 1734, for wagers relating to the public stocks, should be void.

May it not however be surmised that some advantages accrue to a community from a perpetual fund of ready

money, which can be advanced at a moment's notice to the government, or to individuals? Does not a stock-exchange retain in this applicable form a mass of capital, which would else be vested in bonds, mortgages, or other slowly derangeable securities? Do not some advantages arise from the political vigilance of a body of jobbers much interested in the wise conduct of state-affairs? Do not the commissions levied by bankers and brokers on the amounts which change hands, belong to the class of productive circulations? Is there not an important consumption of stamps occasioned by these transactions? Ought all the prizes of life to be reserved for prudence, industry, frugality; has not a spirit of enterprize and adventure, bordering on rashness, also its value? "Nothing venture nothing have," may be no proverb in poor Richard's almanac; but if it does not suit an economic, it may suit an opulent society. Does not much of our most important commerce originate in, and owe its success to this liberal daring? Is not a stock-exchange a seminary and conservatory of courageous hazard? Mutability of fortune is the parent of many virtues: there is more of courtesy, of attention to inferiors, of tenderness to the victims of adversity, in those who are much exposed to reverses of situation, than in those whose entailed acres defy imprudence itself. The stock-jobber is favourably circumstanced for discipline in such qualities: nor are his misfortunes wholly useless; the inequality of riches is surveyed with more complacency for being liable to capricious interruptions.

There is an old book of Mortimer's, Every man his own Broker. Cases of difficulty are since become more various and complex. Further elucidations and instructions were desirable. The present writer has collected with meritorious industry the principal trials which have occurred since the 7th of George the second, in order to compel the fulfilment of bargains, of which evasion has been attempted under that act. We think the act itself should be repealed; and indeed all the laws, which hinge gaming transactions on a mere principle of honor. They were originally made to privilege noblemen against bankruptcy:

they are in the spirit of feudal legislation: they legalize villainy, when they are obeyed: they secure a preference to the sharper and swindler, over the tradesman and the regular creditor, when they are disobeyed. They encourage gaming by taking out its sting: a man plays more boldly, because he knows he can take refuge in dishonour: but when he has lost, he chooses to quit the asylum, which during his frenzy he looked to as a refuge. The good sense of Lord Mansfield saw that these privileged frauds should be restricted within the narrowest possible bounds. He made the first inroad on the exceptionable act, which our author has recited: we shall transcribe the narration.

“Notwithstanding the plainness and precision with which the act was drawn, numerous cases have been argued and adjudged in the different courts respecting the extent of its provisions. The devices and subtleties that were invented to evade its obvious meaning, soon rendered applications to courts of justice necessary: and the first case of importance came on to be heard in the court of King’s Bench before Lord Mansfield, in the seventh year of his present Majesty, which is hereafter stated.

“But as the act itself forms the grand basis upon which most of the cases have been decided, perhaps it will be the least perplexing method of arrangement to take them in chronological order, so far as the subject matter will admit of it: remarking, as we proceed, on the rules and principles arising out of them; and adverting to other cases relating to stock-jobbing transactions prior to the passing of the act, when they serve to elucidate any point of law. One decided advantage of this mode will be, that of carrying the reader along, step by step, in the history of stock-jobbing, from what may be called its legal birth, to its present state of maturity.

“It would appear that the act had the effect of curbing the then prevailing disposition for jobbing, as no case of importance seems to have been decided on it till the period above alluded to, when that of Faikney against Raynous and Richardson was heard, in which the court decided, ‘That money borrowed to pay a stock-jobbing contract, though of the partner in the transaction, was not within the statute.’

“The case reported in the 1st of Blackstone, 639, is as follows:—To an action of debt on bond, dated the 23d February, 1765, for 8,000l., the defendant prayed oyer of the bond and condition, which was to secure 1,500l.—and pleaded, first, *Non est factum*, in which issue was joined: and, second, That since the statute, the plaintiff corruptly entered into several agreements for transferring sun-

dry parcels of stock, on the joint account of himself and defendant Richardson, to be delivered at a certain time, called the Rescouter Day, in February following; and, in performance thereof, corruptly, and contrary to the form of the statute, paid 3,000l. to divers persons, for making up the difference in price, for not performing the said contracts, and that the bond was made for securing to the plaintiff 1,500l., being Richardson’s moiety of the said differences; and for no other consideration, and therefore void in law.

“The plaintiff demurred; and defendant joined in demurrer.

“LORD MANSFIELD.—‘I am clear that this is no defence, even allowing it to be well pleaded. Compounding differences for stock sold, is not *malum in se*, but merely *prohibitum*. Where a thing is prohibited by Act of Parliament, it is void as between the parties, and no court of justice will allow a man to recover for what is made unlawful to be done. But this case is not within the Act of Parliament.

“The bond is for money lent to another to fulfil a prohibited contract. If a man lends money to be lent upon usury, or to pay a gaming debt, can it not be recovered?—There is no difference whether borrowed of Faikney, or of any other person.’

“Judgment for the plaintiff, in which Yates, Aston, and Hewit, concurred.”

We sincerely wish this pamphlet may be a mean of drawing the legislature to the immorality of the act of parliament, and that all bargains made at the stock-exchange may be rendered as legal, as valid, as open to recovery in the courts of justice and by the process of law, as the bargains of merchants on their Exchange. Principle is the victim, and fraud the gainer by a system, which has lately protected the dishonesties of opulence, and punished the honourable fidelity of mediocrity.

We shall state this author’s highly proper and respectable counsel concerning a recent transaction.

“But a subject of considerable importance, and which has of late claimed much attention, continues still undetermined by any express decisions:—this is the validity of a bargain made at a time when false and groundless reports, raised and propagated for fraudulent purposes, materially affecting the price of stocks, are generally credited. Under such circumstances, some persons contend that a bargain made for the purchase of sale of stock, which has not been actually transferred, becomes *ipso facto* void; and that no legal claim can be maintained for any damage which the buyer or seller may thereby sustain. The same persons will admit,

notwithstanding, that a bargain really completed on the day when such false rumours arise and are refuted is good, and cannot afterwards be impeached.

"Others again contend, and with greater appearance of reason, that all such bargains, whether completed or not, where the party claiming the benefit of them is ready, and does all in his power to fulfil his part of the agreement, are valid and binding upon the other party.

"Nay, some have gone so far as to hold such bargains good, when one of the parties was aware of the fallacy of the reports at the time of making his contract.

"It is clear that some of these opinions must be ill founded.

"To establish the principles on which the question ought to be determined, it may be proper to advert to the real nature of the subject. Stock, it is well known, is perpetually fluctuating in price. Its value at all times depends on the state of public opinion, which is affected as well by false intelligence as by true; by changes, real or projected, in our domestic or foreign affairs; by victories or defeats; and by innumerable other causes which operate upon it. In ordinary cases, we never hear of doubts as to the validity of contracts, where the price of stock alters before they can be completely carried into effect. Even in what are called time bargains, no dispute is made on account of an unforeseen or material change in price, because both parties, in truth, may be said to speculate on a change, or, at least, to anticipate it in one way or another: and it will not be contended, that such changes invariably take place on circumstances always evident, but on those only that are generally credited at the time; for men argue differently, from natural phenomena and political appearances: they have different capacities, different degrees of knowledge, and different intelligence. But the means of information and judging being open to both, each professes to act from his own skill and sagacity; so that, at the most, it will amount to no more, on this view of the question, than the setting up of one opinion in opposition to another. We find, then, an uninterrupted and acknowledged assent by all parties to what may be termed the usual and ordinary fluctuation in the price of stock, which, it is presumed, will establish the law on the sub-

ject; and till the late barefaced imposition upon the public, in the notified peace, or settlement of differences with France (which may be called an extreme case), no doubt whatever appears to have arisen upon the mind of any one conversant in stock transactions, that bargains were invalid, because the intelligence, on which depended the price of the day, was false. Unless actual fraud can be charged upon one of the parties, as that he was a party to the deception practised on the public, in such cases, it seems evident that bargains so made are good, though not completed in all respects, provided the party claiming the advantage of them does all that is requisite on his part to carry them into effect."

It is a common remark, and we believe there is truth in it, that the worshippers of fortune are commonly lucky. The dabblers, the occasional buyers are mostly bit, we should say maimed; but the dabs, the persevering jobbers, seldom walk off lame. Probably chance has its general laws; there are seasons of the year, states of the money-markets, which bring on a rise and a fall foreseeable by that sort of vague instinct, which habit of business may tend to form. The practice of risking, may evolve a delicacy of observation, to which bystanders never attain; and thus success may be a species of sagacity. This would form an excuse the more for learning to be a player. The proportion is small who sink in consequence of launching their skiffs on the Euripus of funds and actions.

Servius Tullius built at Rome the first temple to *Fortuna publica*. Our temple to public fortune is the stock exchange: the goddess stands not on a wheel, but on the bank transfer books, which she does not open: her eyes are not bandaged, but occupied with the columns of a newspaper: her crest is a weathercock: a bull and a bear are pictured on the standards of her hostile sects of worshippers: a lame duck is the emblem of the excommunicated.

ART. LXI. *A Letter addressed to the Citizens of London and Westminster, suggesting Improvements in the Police; congenial with the Principles of Freedom and the Constitution.*  
By T. COLPITTS. 8vo. pp. 34.

THE subject which employs these pages is of the highest consequence, and cannot be too severely investigated: it is a well-known proverb, 'Set a thief to catch a thief,' and it is pretty generally understood, that the subordinate officers of justice in the metropolis, runners,

constables, &c. &c., are not remarkable for the purity of their morals, or for any disinterested exertions in favour of public tranquillity. They have their little arrangements, and exercise vigilance too frequently in proportion to their fee; of which, if their employer disappoints

them, he has too much reason to apprehend revenge.

The business to which any man is brought up is certainly that in which he is most likely to excel; and the permanent police officers are conversant with all the tricks of rogues and robbers, know all their haunts, are singularly alert in the discovery of an offender, and acute in directing their suspicions to the right person. Mr. Colpitts, however, is strenuously hostile to this class of people: he considers it a reflection upon society that police officers should be living, perhaps upon terms of intimacy, with those very villains upon whom they pounce in an unguarded moment; he considers it also irreconcilable with the idea of a constitutional and effective police, that a part of society should be constantly under the suspicion of the police; that individuals having committed crimes, for which they cannot be punished *yet*, (being not ripe for punishment) instead of checking the dissoluteness of their lives, it should be the interest of these hired constables, rather to encourage them in their career of ruin, in order, that at some future time the conviction of their depredations may bring in a more fruitful harvest. Mr. Colpitts is also of opinion, that society does not gain much by the exclusive knowledge of these officers: if they know the depredators, the depredators know them; sagacity is opposed to sagacity, cunning to cunning, both parties live by the constant exercise of their wits, and vigilance in detecting, may be foiled by superior vigilance in eluding.

This is very true, but it must be recollected that the original cunning is in the thief; his will never be thrown off, and therefore it is necessary that he who watches him should be possessed of, at least, an equal degree of the same quality. How Mr. Colpitts' plan would operate, if—about which we have the strongest doubts—it could possibly be brought into operation, our readers will judge for themselves when we lay it before them. As to the disgracefulness of having one class of society constantly watching over the actions of another; it may be disgraceful that such vigilance is necessary, but so long as it is necessary, it must not be abated. Persons leading a notoriously reprobate and abandoned life, ought to be, and must be vigilantly watched, for the sake of public security; and jealous as we pro-

fess to be of our rights and liberties, we cannot enter into all Mr. Colpitts' alarm on the present occasion.

Mr. Colpitts proposes to have the present race of police officers disbanded, and the police placed in the hands of the citizens at large; he would have respectable inhabitants of the several parishes, take the acting part upon themselves in rotation, being annually elected. As to the present officers, they might be employed as tide-waiters when vacancies take place, or put into any vacant posts about the victualling-office, or dock-yards; some few of them might be retained as messengers for removing prisoners to and from the country, but acting subordinately to the elected constables, not between the magistrates and them.

“The district of each constable in his parish, ought to be no larger than he can conveniently superintend; and where it is larger, associate constables should be named to assist him; every inhabitant of such district, both male and female, above the age of childhood, ought to be known to him: for this purpose, every occupant of a house should be obliged annually to give in a list to him of his family, and every inmate in his dwelling, as they came and removed, without, however, being obliged to declare from whence they came, or whither they are removed, (unless such inmates themselves chose to declare it) or any other particulars respecting them, without they had absconded, and were charged with some crime. And for the purpose of gaining a personal knowledge of such inhabitants within his district as are unknown to him, he ought to visit each house as soon as he was inducted into his office; when such inhabitants of it should present themselves before him, and every new inhabitant and lodger, when they entered, both male and female, should present themselves before the constable of the district, accompanied by the landlord, or letter of such premises, and their name and age only taken down; nor should it be allowed that any occupant of a house in London should take in a stranger, even for a night, without such stranger appearing before the constable, or his associate, or if too late to see either of them, before the superintendent of the watch, at the nearest watch-house, to whom he should declare his name and age, but nothing more.”

Mr. Colpitts is not singular in his opinion of the necessity there is to revise the laws respecting the responsibility of proprietors and occupiers of houses, in order to prevent those infamous resorts of lewdness, which now infest almost

every street, and which the tedious process of indictment is found inadequate to suppress. In order to remedy this crying evil, Mr. Colpitts would arm the law with a power, which we confess we cannot contemplate without fear. Upon conviction of the offender, Mr. Colpitts would authorise the police of the district to enter into possession of the guilty house, retain it during three years as a punishment for the first offence; "letting it, and superintending the management of it in all respects, deducting one-fifth, or twenty per cent. per annum, from the annual produce of it, by way of fine, and for the trouble of superintending it, rendering the surplus to the owner; and upon a second conviction for misuse of such property, to enter again into possession of it, for the *natural life* of such person."

"It may be necessary also to place the pawnbrokers business under improved regulations, for it is through them that the great mass of stolen property is converted into cash; their interests upon the money lent ought to be reduced, and they should be compelled by law to give in to a proper

office, (the police office of the district for example,) twice every day, triplicates of every articles taken in pledge in the course of that day. What harm could attend a disclosure of their business thus far to a proper office? This would often lead to an immediate detection of the thief, and would almost totally deter them from offering stolen goods for pledge. Would it not also answer a good purpose, in order to put a stop to chandler's-shops, and other petty traders, from buying stolen goods, to give a per centage upon the value by way of reward, for stopping the goods, and the persons offering them for sale? The thief would here be placed in the situation, when he offered stolen goods for sale, of offering a reward at the same time for his own detection."

Some excellent remarks occur on the subject of granting licences to publicans; some hints for the regulation of draymen, porters, hackney coachmen, coal-dealers, &c. &c., are well worthy of attention; they might be carried into effect without trouble, without expence, and we are persuaded the adoption of them would be advantageous to the community.

ART. LXII. *Observations on the Importance and Necessity of introducing Improved Machinery into the Woollen Manufactory, &c.* By JOHN ANSTIE. 8vo. pp. 99.

THE use of machinery in manufactures has often occasioned literary controversy, and popular turbulence. Some persons see in it an unkind contrivance to render human labour less necessary, to diminish the serviceableness, and abridge the comforts of the poor, and to metamorphose the starved population of villages into mill-horses and steam pumps. Others maintain, that to cheapen production is to increase demand; that all the creations of machinery are put more within reach of the lowest incomes, and consequently increase the comforts of the multitude; that the profits economized maintain an increased proportion of the enjoying classes; that leisure is won for man by casting labour upon nature; that if spinners are discarded in one neighbourhood, weavers are put under requisition in another; so that there is an eventual increase both of the quantity of work to be done, of the proportion of polished and cultivated existence maintained by that work, and of the fixed and taxable property responsible to the parish and to the state. To us the latter set of arguments appear the more conclusive.

Mr. Anstie thus states his hesitations:

ANN. REV. VOL. II.

"In the further prosecution of the subject, the arguments used for proving the pernicious tendency of introducing machinery into the clothing business, may be comprised under the three following heads:

"1st, It has been frequently objected by intelligent persons, and even by some manufacturers themselves, that the introduction of machinery into the clothing business must be pernicious, as only a limited quantity of the staple article, wool, of our native growth, could be produced for our middling and coarser manufactures, and that the possibility of obtaining an increased quantity of fine wool of the growth of Spain, for our superior cloths, must depend on the demand for that wool from France, Holland, &c.

"The conclusion drawn from these supposed facts is, that machinery must be prejudicial, by diminishing the labour necessary for the employment of a great number of persons in making goods, without the possibility, as we do not, in the opinion of the objectors to the use of machinery, possess the means of increasing the manufacture, but in a very limited degree, even should the demand require it, consequently those persons could be no longer employed in the woollen business.

"2dly, The corruption of the morals of the people, especially of the children employed in the factories, in consequence of collecting them together, has been considered as a formidable objection to the use of machinery.

B b

"3dly. From the general introduction of machinery, it has been confidently said, the staple manufacture of the kingdom is endangered, by its being so much more easily transferred to other nations.

"The advocates for restrictions assert, that the use of machinery, by rendering the superior skill of those persons, long accustomed to different branches of the manufacture, comparatively useless, it will become perfectly easy to form establishments for the trade in other nations, as only a few superintending persons will be wanted, who may be fully competent to the management of machinery."

In reply to the objection about the obtainable quantity of wool, why not repeal the laws against *swaling*, transport our best breeds of sheep to Canada, and there grow the desirable profusion of clothing wool?

In reply to the objection about the morals of manufacturing children, is it not equally applicable to all opportunities of indiscriminate association, among the children of the poor; to Sunday schools, for instance, the purlieus of which are, in many large towns, lurking places of premature debauchery? If both sexes have separate playing-crofts, if they are attended during meals by a chaplain or pedagogue, if they always separate by day-light, and return at a

known hour to sleep under the parental roof, the only precautions which our state of society can insure seem to have been taken.

In reply to the objection of the transferrableness of machinery, let an appeal be made to observation and experience. Those manufactures, which require only the tuition of human individuals, have often migrated; whenever intolerance, religious or political, has expatriated a few teachers. But those manufactures, which are produced by costly establishments of mechanism, have never migrated: and for this reason, that whenever the demand slackens, the rent of the machinery abates; so that the article produced thenceforwards incurs a smaller charge for the wages of enginery, (if we may so word it) than it would have to incur, if new engines were to be constructed for its production. It must therefore always be cheaper to buy where there are machines of long standing, which have already overstocked demand, than where the mechanism is new, and has to earn the interest of its cost.

The postscript notices some laws concerning apprentices, on which it would be interesting to hear the opinions of so experienced a judge.

ART. LXIII. *Observations on the Propriety or Impropriety of exporting Cotton Twist, for the Purpose of being manufactured into Cloth by Foreigners.* 8vo. pp. 64.

IT has been thought an object by our lawgivers to compress, within the island, the largest possible resident population, without any regard to the quantity of subsistence which can be grown at home. For this purpose, raw materials are suffered to be imported with little or no burden of duty, manufactured articles are burdened with heavy duties, or wholly prohibited, and thus manufacturers of various descriptions are rewarded for residence. If there were no restrictions of this kind, and all exportation and importation was free, the consumer of silks would probably buy them from Lyons cheaper than from Spital-fields; and many weavers, who are maintained here, would be maintained on the continent. This is a sacrifice of wealth to strength, which was really expedient while the nation was underpeopled, but which is daily becoming less important.

If the exportation of cotton twist were prohibited, the article would sell lower, the weavers of cotton would be able to purchase it on easier terms, they would be able to offer woofs at a lower price,

and would sell more piece-goods than at present. More resident weavers would thus be maintained here, and some continental weavers would be thrown out of employ; but there would be a loss of wealth incurred in the diminished value of the machines erected for spinning cotton.

It is probable that our mechanics will, ere long, contrive to weave calicoes by machinery, as well as to spin the component threads. It will then cease to be the interest of foreigners to purchase twist; because the second operation, as well as the first, will be performed cheaper here than on the continent.—The construction of such machines, would be the best cure for the decrease of business complained of by the bleachers, dyers, and printers of cotton stuffs.

Our author would have the legislature interfere, and interrupt, by a prohibitory duty, the exportation of cotton twist. We would have them let it alone. The immediate loss to the spinners would be great, and the discouragement to enter prize immense.

## CHAPTER IV.

## GEOGRAPHY.

ART. I. *Modern Geography: a Description of the Empires, Kingdoms, States, and Colonies, with the Oceans, Seas, and Isles, in all Parts of the World; including the most recent Discoveries and political Alterations, digested on a new Plan.* By JOHN PINKERTON. Carefully abridged from the larger work. 8vo. pp. 708.

In our former volume (p. 437) we gave a detailed account of the very valuable original work, of which the volume before us is an abridgement: a short notice will therefore suffice on the present occasion.

The plan followed seems to be not so much that of general compression, of which the original would not perhaps admit, as of lopping off or considerably shortening particular portions, which, to common readers, and the young student of geography, are the least interesting and important.

Thus we find the introduction, which still consists of above sixty closely printed pages, is restricted to those topics which are immediately connected with geographical science. The antiquarian and historical criticism is reduced to a small compass; and the botanical sketches of the different countries which

were loaded with Linnæan nomenclature, and of a length extremely disproportionate to the other matter, have been judiciously contracted and amended. The provincial divisions of the European states, which are for the most part omitted in the quarto edition, are carefully inserted in the present; and the population of the counties and towns of Great Britain has been inserted on the authority of the late enumeration. There are other more minute additions and improvements, all tending to qualify the book for the particular use of schools and young people. The only objection that we have to make concerns the maps. These are too few, and much too general to be of great use: as far as they go, however, being abridged from those of the original work, they are much more correct than any of equal size that we have yet met with.

## CHAPTER V.

## BRITISH TOPOGRAPHY

AND

## ANTIQUITIES.

THE publications that belong to this department of our work, are considerably more numerous than those which were noticed in the corresponding chapter of our former volume; in merit and originality, however, they are decidedly inferior. During the short interval of peace, many of our tourists were no doubt attracted to Paris; and on the recommencement of hostilities, with the expectation of imminent invasion, were probably occupied by more serious concerns than rambling about the country, in quest of picturesque scenery or sentimental adventures. Prudential motives, induced by the same lamentable event, have, in all likelihood, suspended the publication of some of the more expensive works in Topography and Antiquities, which, requiring the illustration of maps and plates, cannot be expected to be carried on with spirit during the transition from a state of public tranquillity, and private adventure, to one of private economy and public hazard. Instead, therefore, of giving a general sketch of the topographical and antiquarian works which have issued from the British press during the last year, and which will be amply noticed in the following articles, we shall take the liberty of offering a few remarks on the present state of British topography.

As geography, strictly speaking, means only a description of the great natural features of the earth, and its principal civil divisions, so topography, treating of a particular country, or county, or hundred, or parish, ought properly to be confined to a more minute investigation of the same general subjects. Hence it is impossible, by definition, to distinguish the one from the other of these branches of knowledge, and there are many publications which may, with almost equal propriety, be denominated minute geographies, or general topographies: of which Büsching's *Geography of Germany* is a striking foreign example, and the "*Beauties of England and Wales*" is a domestic instance. While the geographer describes the courses of the great rivers and of the principal chains of mountains, indicates the leading territorial divisions, and points out the situation of the most remarkable towns and cities; the topographer follows the meandering of the smaller streams and their tributary brooks, marks the minuter undulations in the surface of the soil, traces parish boundaries, and ascertains the position of villages and hamlets, of castles, cathedrals, and manor houses. Pure geography, however, to most persons, is but a dull study, and, in consequence, the generality of modern writers on this subject have incorporated into their works various particulars relative to the natural, political, civil, and statistical history of the countries described. Pure topography, treating of the same subjects, but with much greater minute-

ness, is still less qualified to excite much interest, except in those who are personally acquainted with the districts and places thus noticed: hence the topographer is indulged in a wider licence, and is allowed to ornament his collections by interweaving family history, biography, antiquarian research, architectural details, and almost every particular that he chuses, however slightly connected with the main subject. These digressions, if restrained within reasonable limits, and judiciously selected, confer a real additional value on topographical investigations. But when, from the minuteness or insignificance of the district which the historian selects for his illustration, a deficiency is experienced of proper topographical matter, (which is almost always the case in descriptions of single parishes,) it is scarcely possible to avoid giving an undue weight to these irrelevant topics: of which Mr. Gough's History of Pleshy, noticed in this chapter, is a very glaring example. In addition to the want of judgment exhibited by many of our topographers, in circumscribing themselves within too narrow a district, may be reckoned the exclusive and undue preference bestowed upon antiquarian subjects: an anecdote, because it is old, is not necessarily on that account worth relating; the half-defaced inscription on a tomb-stone, two hundred years old, acquires no greater value from this circumstance than one of modern date and perfectly legible; nor does the authenticated succession of churchwardens, parish-clerks, and sextons, contribute any thing to the illustration of our ecclesiastical history.

The general want of maps, and the extreme inaccuracy of those few which are annexed to our topographical histories, is another serious ground of complaint. Almost all the counties of England have been surveyed within the last forty years, and the maps drawn up from these documents, erroneous as they are in many respects, would, by the help of plans of estates, which are for the most part easily procurable, furnish ample materials for the construction of parish or hundred maps, adapted to the use of the topographer, and susceptible of gradual improvements as opportunities might occur. The splendid and accurate maps from trigonometrical measurements, executing under the direction of government, will take away all excuse from future topographers, who may neglect to avail themselves of such valuable assistance. The survey of Kent is actually published; that of Essex is compleated, and is only kept back, for obvious reasons, till the termination of the war; Devonshire and Hampshire are in a state of forwardness.

Engravings are too often reckoned mere articles of decoration; but when inserted in topographical works, they profess to be representations of real objects and actual scenery. This, however, is seldom the case: the pencil is either assumed by incapable hands, unable, though perhaps desirous, of delineating with fidelity; or an artist by profession is employed, who will, knowingly and without scruple, violate the truth of nature to produce what he calls picturesque effect. It ought to be inculcated on all topographers, as a serious duty, to sacrifice all those graces of painting which are inconsistent with perfect fidelity; and in the choice of scenery to select that which is most characteristic of the country, without considering whether it will please or disgust the professed artist, to whom individuality of representation is of no value.

One further observation, and we have done. Our tourists and county historians, in their descriptions of the houses of our nobility and gentry, think it

essential to pay particular attention to the statues and exquisite paintings which they contain, and which, without these notices, might clude the enquiry of the painter or amateur. So far they have our praise; and it is to be wished, that they would extend their search to the libraries in which are deposited books and manuscripts of inestimable value, unknown to the literary public, and not unfrequently even to their own proprietors.

**ART. I.** *Antiquities, historical, architectural, chorographical, and itinerary, in Nottinghamshire, and the adjacent Counties: comprising the Histories of Southwell, (the ad Pontem,) and of Newark, (the Sidnæstier of the Romans;) interspersed with biographical Sketches, and profusely embellished with Engravings. In four Parts. By WILLIAM DICKINSON, Esq. Parts I. and II. forming Vol. I. pp. 472.*

THIS work is an altered and enlarged edition of "a History of the Antiquities of the Town and Church of Southwell, in the County of Nottingham. By William Dickinson Rastall, A. M." 4to. 1787.

The first was dedicated to the present Archbishop of York; but the work now before us is laid at the feet of the President and Fellows of the Society of Antiquaries.

The author observes, that it has long been considered a pleasant and useful inquiry, to determine the roads and stations of the Romans in this island; some of those are still buried in obscurity, others are the subject of conjecture; but "Southwell certainly, Newark with great probability, present a most exuberant field for examination." In this field our author has chosen to labour, hoping to produce a crop of conjecture, and certainly worthy the consideration and acceptance of the learned in antiquity. The stupendous church of Southwell was a primary object in the field; bearing "the distinguishing characteristics of Roman, Saxon, Danish, Norman, and Gothic architecture," in perfect condition, and pointing out the minutest gradations from each style to the next. This *may* be very true, though we strongly suspect it; but the treatise upon ecclesiastical architecture is totally distinct from Roman roads and stations, and ought not to have been "*agglomerated*" with a dissertation on them.

The author, having explained his intentions, wanders into a digression founded upon the contradictions of those authors who have written on antient architecture; and endeavours to reconcile what never was, and never will be reconciled, the discordant opinions of men upon any given subject; but the concluding paragraph of the preface is well

expressed. "Through the whole œconomy of nature the same rule ever does, and ever must obtain. The efforts of imbecility will always precede the exertions of maturity; conjecture is the first step toward (*towards*) certainty, and speculation the infancy of real knowledge."

The introduction commences with an eulogium on antiquarianism; which Mr. Dickinson calls, not inaptly, the mother of history.

From *antiquarianism* the author springs to architecture, which he supposes to be coeval with the globe itself. Undoubtedly so, if we are inclined to permit a covering of leaves, strewed on sticks set upright in the earth, to be denominated architecture. But would not the eulogium on antiquarianism, and the origin of architecture, however well written, have been more appropriately affixed to the first volume of an archæologia, and the works of Palladio or Vitruvius, than to a search after Roman stations, and a history of Southwell?

Another objection is still more powerful. This introduction is increased enormously by the labour of others; for instance:—"In pursuance of my plan, then, the outline of which I have already suggested, I shall place first, in my catalogue of critiques on ancient architecture, the observations of Stephen Riou, esq. published several years since, under the title of "Historical Remarks on ancient Architecture." He accordingly quotes three quarto pages, adding two notes; one explanatory, the other combating an inference, that Gothic architecture was derived from the Arabians.

"So far this writer, who is at least entitled to great attention from the plausibility of his account. We shall see what others have said on the same subject. In Horace Walpole's celebrated work, he

fore cited on a different occasion, are the following observations," which are extracted to the amount of two pages and an half, and are accompanied by three notes; the first an ironical observation on the antiquity of free-masonry; the second on the distinction between Gothic and Saracenic architecture, marked by pinnacles in the former, and cupolas in the latter; and the last objects to the term "*undulating*, zig zags," used by Mr. Walpole. "I shall hereafter have occasion to observe, that all undulations, or ornaments, partaking of the sections of globes, cones, and cylinders, are of *Saxon extraction*, but that angular ones are to be attributed to some other people; they were certainly introduced into this kingdom by Norman architects."

We cannot avoid observing, on this part of the subject, that almost all our antiquaries prefer a circuitous way of obtaining information. Some travel through England, others through books; the buildings, in one instance, and prints in the other, exhibit a variety of ornaments; they cogitate on them, and form conjectures, without possessing one fact to direct their bewildered fancies. However, they must *say something*. Accordingly one is Saxon, another Norman, &c. &c. because Mr. — chooses to think so. If the research is worth pursuing, why do not the Society of Antiquaries send experienced artists into Saxony, Normandy, Denmark, and Arabia, or, in short, into every country whose buildings could elucidate the subject, in order to make drawings of structures and ornaments? which, compared with ours, would decide the source of each style at once, and fix the dispute for ever.

To proceed in illustration of our charge, *three pages* are extracted from a work published twenty years past, describing the cathedral of Burgos; *a page and an half* from Bentham's History of Ely Cathedral; *two pages* from Grose; *six and an half* from Murphy's Description of the Batalha; *two and one-third* from Wilkins's Essay on the Venta Icenorum of the Romans in the Archæologia; and lastly, *three* from Warburton; so that of an introduction, containing forty-two pages, twenty-four are quotations.

Mr. Dickinson then proceeds with combating the term Barbarians, affixed to the Goths by the vanquished Romans; and with a continuation of the conjectures commenced by preceding

writers, which we think might be solved in the way above suggested.

He concludes with an odd method of appropriating styles in building, by comparing them with the constitutional habits of the nation who erects them, than which nothing can be more palpably absurd.

The oldest part of Southwell church is of Saxon architecture, erected, according to the tradition of the place, in the reign of Harold, to which Mr. Dickinson seems inclined to subscribe; but as there is not a record remaining of the foundation, tradition and conjecture must be the base of all his theories; they follow, therefore, as a matter of course. — The side aisles, he conceives to be "pure Norman; and, I should guess, about the time of William Rufus, or perhaps somewhat later. This opinion is founded on the essential differences to be observed between the style of the nave, and that of these aisles. The former has a timber roof, as has before been mentioned; and arches, of a species of workmanship, strongly indicative of ignorant times, and of the rudest notions of architecture. The latter have vaulted roofs, and those not of the earliest introduction, but supported by ribs, which form angular compartments at their mutual intersections in the centre."

That the church of Southwell was in a flourishing state, A. D. 1023, Mr. Dickinson proves from William of Malmsbury, and other writers, who assert, that Alfrie, archbishop of York, gave it two bells; for the reception of those, he supposes, the tower (we suppose the center one) to have been built. Several pages of ingenious reasoning are appropriated to the establishment of his conjectures, that this church arose in Harold's time. They are supported by comparisons with other buildings, whose periods of erection are well known. The author then proceeds:

"To the Norman order of architecture (which, it seems, did not differ materially, at first, from the Saxon, in any of its most essential characteristic features, but was equally distinguished by circular arches, and massive pillars, with perhaps some little addition of sculpture, and, in some instances, vaulted roofs) succeeded what is generally understood, though some think improperly, by the denomination of Gothic; because, as Wren writes, 'the Goths were rather the destroyers than inventors of arts.' This style of building seems to have been introduced before the reign of King John, and to have prevailed very generally in that of Henry III. It con-

tinued with little variation till the time of Edward III. when a considerable alteration took place in the construction of the pillars and roofs. The latter began to be divided into several compartments, by kinds of ribs meeting in the center of the arch, and forming triangular spaces on each side. These ribs, and the junctions of them, were more or less ornamented, according to the affluence of the builder, the skill of the architect, the vicinity of the place to the seats of fashion and improvement, either metropolis of the kingdom, (London or York) and to the purposes of the building. The columns now began to take the form of a cluster of small pillars, closely united, and forming one compact and solid, but slender and elegant support.

"About this period, and before any great alteration began to prevail in the mode of constructing the windows, we might, from the general style of this fabric, if we wanted other evidence, pronounce the choir of Southwell church to have been erected; but this matter is placed beyond a doubt, by the licence of the King, (Edward III. printed in the Appendix, No. 1,) in the eleventh year of his reign, to the chapter, for the getting of stones from a quarry in his forest of Shirewood, for the building of their church.

"The heads of Edward III. and his queen, as also that of the Black Prince, support the ribs or springs of several arches in the choir. The prince's head, crowned with his three feathers, is particularly conspicuous on the north side; and over the center arch, on the south side, are the feathers only, neatly cut in the stone. By these numerous compliments to the prince, we may presume, this part was erected just at that point of time when, by his conquest in France, he was in the zenith of his popularity. In conformity with the general taste of that age, the windows are narrow pointed, unornamented, and without any division by stone guls or mullions."

We have given this specimen, by way of pointing out to the numerous authors, whose conjectures upon periods and styles of building satiate the public, that they may, in many cases, convert them into certainty by a little trouble and research, as in this instance. Mr. Dickinson's observations upon the mode of building used in the reign of Edward III. are read with interest, because we know that they are founded upon undoubted facts; and we further recommend to them always to keep such facts in their recollection.

We are sorry to observe our author has invented a new term for mullions, which he calls guts. Exclusive of the filthy ideas conveyed by this word, we

cannot conceive the most distant resemblance between the intestines of either man or beast, and the beautiful pillars and ramifications of antient architecture.

Mr. Dickinson dwells with much pleasure upon the beautiful arch which forms the entrance to the chapter-house; it is certainly rich in ornaments, and he supposes it was erected in the reign of Richard II. But it will be impossible to disentangle the endless web of conjecture, (by an analysis of moderate length) which composes all the remainder of the second chapter. The reader, who delights in argument ingeniously supported, and who can bear a repetition of those arguments which form the subject of the introduction and chapter first, will read it with avidity.

The third chapter commences with the town of Southwell, which furnishes another field for doubt and conjecture. "At what period this place obtained its present appellation," says Mr. Dickinson, "it will be almost impossible to ascertain. That it has formerly flourished under other names, even at so remote an æra as that of the Roman government in Britain, there is strong reason for supposing; that it was a place of some note among the Saxons, we have authentic testimony for believing."

Speaking of the Roman roads and stations, "the principal route which I am now to investigate is, that from London to Lincoln; from which, as has lately been observed by a very learned antiquary, 'there seem to have been others of inferior note (passing through Southwell) to Nottingham and Mansfield.'" He then quotes the table of places and distances from the *Itinerarium Antonini*; all of which are appropriated but Verometum, Margidunum, Ad Pontem, and Crococolana.

"The first station then, after Ratæ or Leicester, which demands enquiry, is Verometum. Pursuing the Roman road, or foss, as it is still called, on the confines of Nottinghamshire, we come to a field at the brow of the hill, overlooking Willoughby brook; where, as Dr. Stukely, the industrious antiquary says, 'many coins and mosaic pavements have frequently been dug up, and leave no room to doubt its having been a Roman station.' The distance from Leicester answers very exactly to the Roman estimate; and fixes, with considerable precision, the antient Verometum at this place\*. Margidunum,

\* On the Willoughby side of the road is a tumulus, called Cross Hill; and on the opposite

the next station, is equally ascertained. At the distance, where the *Itinerarium* fixes it, are the remains of a Roman camp. 'Many Roman bricks, says our last mentioned author, and other antiquities, have been found, particularly a coin of Vespasian.' This is called Barrow-field, and is in the parish of East Bridgeford. The same account of this place is also to be met with in Camden, Horsley, and other topographical writers.

"We now come to Ad Pontem, the post of difficulty. Many persons, deceived by the supposed etymology of its present name, have placed this station at Ponton, near Grantham; but the name is all that can be discovered to justify such an opinion: while the arguments are numerous which may be urged against it, among the rest, that there is no water, in or near Ponton, to require the accommodation of any considerable bridge; and it is not probable, that a small and inconsiderable one should have given distinction to a Roman station. But the most material objection is, that the town of Ponton lies so entirely out of any reasonable direction from Leicester to Lincoln, that it is almost impossible to conceive the Romans could make it a station in their route between these two places. Still, however, if there remained a doubt, the distance of Ponton from Bridgeford would decide the difficulty; for the *Itinerarium* makes Ad Pontem only seven Roman miles from Margidunum; Ponton is nearly twice that distance."

We have selected the above observations, in order to shew our author's method of arguing, which we must confess is clear and conclusive: his succeeding remarks cannot fail to excite the attention of all who are fond of this branch of knowledge. An exceedingly neat plate is given of the remains of a Roman foss on Burridge-hill, Southwell, and a map of Roman roads and stations, equally well executed, which is explained in eight pages, closely printed.

The following paragraph must not be omitted:

"A very recent discovery points out a precise track which led to one of the other stations from Ad Pontem, viz. to Lindum through Crococolana. The want of this has always been the stumbling block to antiquaries in determining Southwell to be Ad Pontem: the discovery of it seems to put the question almost beyond a doubt. The summer months of 1792 and 1793 being extremely dry, the foundations of an immense bridge appeared in the river Trent (rendered shallow by the drought), near to the little village of Winthorpe, by Newark. On exa-

mination, there was every reason to think them as old as the time of the Romans; and a sort of negative confirmation of that opinion arises from there not being even the vestige of a tradition that any such bridge has been situated in this part of the river Trent, since the time of the Norman conquest. The site of it, if more closely examined, presents even a still stronger argument for believing that this only doubtful part of the Roman iter has been, at length, ascertained by this accident. If a line were (was) drawn from Southwell to Brough, it would pass over a hill called (from time immemorial) Mickleborough; and also over this very bridge, whose foundations have so lately been discovered."

Most of the towns whose name terminates in borough, are known to have been Roman stations: many discoveries of Roman coins, tessellated pavements, and Roman bricks at Southwell, are undoubted proofs that some of those people were seated there.

The remainder of the first part treats of the name antiently given to this town, its importance, situation, soil of the neighbourhood, the air, foundation of the church by Paulinus, first archbishop of the north, and the registers of the chapter, with several other curious particulars.

"It may be difficult to determine, with precision, what was the constitution of the church of Southwell, at the time of its original foundation; with how many prebends it was endowed; or in what manner and proportion their revenues were distributed. It appears, however, that about the latter end of the reign of William I. there were at least ten prebends, viz. those of Woodborough, Normanton, North Muskham, South Muskham, the Sacrista, two of Oxtun, and three of Norwell."

Mr. Dickinson cites the *registrum album*, or white register, of the foundation, now in the chapter's possession; a book of great antiquity, abounding in curious matter, and absolutely invaluable to all interested in the place: this "determines with certainty the respective times of foundation of the other six prebends, making in all sixteen, as they remain at this day." He confutes an assertion in Dugdale's *History of the Church of Southwell*, published 1716, that the church had antiently a dean and an archdeacon: "I find no mention

side of it, at about an equal distance, are Upper Borough-town and Nether Borough-town, under the modern appellation of Broughton. This indicates the vicinity of a Roman fortification,

made of a dean or an archdeacon in any other place, nor is any authority cited for it by Dugdale."

The white book contains a collection of charters and grants from popes, kings, and other persons, to the archbishops of York and church of Southwell, from a period very little posterior to the conquest, to the time of Henry VIII. of which little use has been made by Thoroton and others. To this Mr. Dickinson is indebted for almost all his authorities, and better information could not be wished for or expected.

Particulars of the prebends which follow, are curious and valuable, because undoubtedly authentic, as are those relating to the pentecostal offerings, and privileges of the church.

"The lands belonging to the fabric lay chiefly in Southwell and Normanton. They do not appear ever to have been considerable, though at different times this revenue received almost innumerable small additions. But any more particular account of these will also be better reserved for that chapter of this work, which I have thought proper to appropriate exclusively to the purpose of recording the liberality of benefactors to this memorable monument of antiquity."

There were originally sixteen vicars choral, each canon appointing his own vicar, and paying him for his choral duty; queen Elizabeth ordained six for this church: the history of those is interesting and amusing.

The other members of the church are an organist, six lay vicars, and six choristers. Dr. Keton, 22 Henry VIII. founded two scholarships and two fellowships, which he placed in the gift of the master and fellows of St. John's college, Cambridge, for persons, "who shall have served as choristers of the chapter of Southwell."

The chantries are next noticed; after which our author adds,

"Southwell and Ripon are said to be the only churches in England, which are as well parochial as collegiate at this day; all the others having been dissolved by Henry VIII. or his successor.

"It now remains to say something of the different prebends, the places from which they have their titles and revenues, and the mode in which those revenues accrue."

Norwell church, dedicated to St. Lawrence, is large, and of the style of building prevailing in the days of Edward III.; it is situated about ten miles

north of Southwell, and furnishes provision for three prebends. The reader will find many curious particulars relating to it, and a pathetic epitaph to the memory of Elizabeth, wife of Gervas Lee.

Oxton, or Oston, gives title to two more of the antient prebends of this church; the town is five miles west of Southwell, "and lately had two considerable halls, or family seats, the property of the Sherbrookes, who have been settled here ever since about the eighth of Elizabeth:" of this family Mr. Dickinson gives some particulars, and a pedigree; together with an account of Shirewood forest, within the limits of which it was originally situated.

Woodborough, a small village, six miles south-west of Southwell, "furnishes one of those prebends which we find endowed at the earliest period of the church." The church of Woodborough has many remains of magnificence and painted glass; the chapter appoint to it, as a curacy, South Muskham, one of the original foundation.—This place was chiefly the property of Galfrey de Scrope, an eminent judge in the reigns of Edward II. and III. and descended to the lords Scropes of Masham. The family of Willoughby, now barons of Middleton, have long had the principal property in this parish: Mr. Dickinson gives some account of them with their pedigree.

North Muskham.—The history of this prebend is accompanied by the pedigrees of Pocklington, Dickenson, and Welby.

Holme.—The chapel of Holme was erected by an ancestor of Sir Thomas Barton's, about the time of Edward III. A very beautiful view of it is given, from which we may infer, that it is one among the best of country churches: an account and pedigree of the family of Barton accompanies it, with a good engraving of an antient monument, on the north side of the chancel, where several of the families of Barton and Bellasys are interred, supposed to be for one of the former, from the tun at the feet of the effigies. Over the door of the south porch, which is very handsome, are seven shields, with the arms of the families just mentioned. "In the center, as I take it, are the original arms used by the great ancestor of the Bartons, to which, by way of supporters, are added a sheep and a lamb, with full fleeces, indicative

of the source (wool) from which the family derived its wealth." The note at the bottom of this page is curious.

"Over this porch is a chamber, called, as far back as memory or tradition reach, Nan Scot's chamber. The story, of which this lady is the heroine, has been handed down with a degree of precision and uniformity which entitles it to more credit than most such tales deserve. The last great plague which visited this kingdom is reported to have made particular havoc in the village of Holme, which is likely enough to have happened from its vicinity to Newark, where it is known to have raged with peculiar violence. During its influence, a woman of the name of Ann Scot is said to have retired to this chamber, with a sufficient quantity of food to serve her for several weeks. Having remained there unmolested till her provisions were exhausted, she came from her hiding-place either to procure more, or to return to her former habitation, as circumstances might direct her choice. To her great surprise she found the village entirely deserted, only one person of its former inhabitants except herself being there alive. Attached to this asylum, and shocked by the horrors of the scene without, she is said to have returned to her retreat, and to have continued in it till her death, at an advanced period of life! A few years since many of her habiliments were remaining in this chamber, as also a table, (the size of which evidently manifested it to have been constructed within the room) with some smaller pieces of furniture."

In this manner the author proceeds, with an account of all the remaining prebends, occasionally interspersing sketches of families accompanied by their pedigrees.—In his notice of Rampton, twenty miles from Southwell, Mr. Dickinson gives a good engraving of an antient gate, which is well worth examination, though he says not a word about it.

In the history of the government and jurisdiction civil and ecclesiastical, Mr. Dickinson informs us, that the archbishop of York is the supreme head of Southwell church, and of the liberty of Southwell, as well in matters civil as ecclesiastical; and that Southwell is the head or metropolis of a peculiar jurisdiction, both civil and ecclesiastical: these two jurisdictions are not co-extensive, twenty towns are in the former, and twenty-eight in the latter. The chapter exercises, in the person of their vicar-general, all episcopal functions within the peculiar, except ordination and confirmation; the archbishop appoints to prebends, but the prebendaries

elect their vicar from their own body, and they appoint all inferiors in the church. The archbishop is visitor of Southwell. When this place was the residence of the archbishops of York, they had four parks in the neighbourhood; of these an account is given, and anecdotes of the successive vicars.

Chapter v. treats of the founders, benefactors, and patrons of the church before the conquest, and from that period to the present time, divided into portions, each containing a reign; of those patrons, &c. many interesting particulars are given, which we recommend to the reader's notice.

The ensuing extract must terminate our survey of this work, which concludes with an account of the archiepiscopal palace; the tombs in the church, antiquities in the neighbourhood, and of almost every place having any connection with Southwell: each article is curious in itself, but their number forbids particular notice.

"The first species of antiquities which claim our attention within the parish of Southwell, are its four famous wells: from one of which, as has been before observed, the town takes its modern name, and for another of which it has been scarcely less celebrated. The former of these is situated on the side of the hill to the south-east of the town, and about half a mile distant from it. The ground in which this spring rises belongs to the archbishop of York, and is part of what was called the little park, contiguous to the palace. From the circumstance of its rising in the demesne of the lord of the manor, it early obtained the name of *Lord's Well*, by which it is still distinguished. This was much used early in the last century as a bath by persons afflicted with the rheumatism; and near it was erected a sort of recess, or alcove of stone work, for the convenience of those that frequented it. This has long been destroyed, and the well is no longer frequented as a bath, but by the boys of the town for amusement, though its stream runs as pure and as limpid as in the days of its pristine reputation. The second well which demands our notice, was situated in the inclosure on the right of the cloister leading to the chapter house. Rising within the precincts of the church, it obtained the name of *Holy Well*. This has been long covered over or filled up.

"Another of these wells had its name also from its situation, which was in the churchyard, immediately under the walls of the choir, on the north side, near to the chapter-house; this was called *Lady's Well*, the church being dedicated to our lady (the Virgin Mary) of Southwell, and the well

within the consecrated ground of the church. It is well known that there was no spring at the bottom of this, wherefore its supply, which depended wholly on rain, was very precarious."

Mr. Dickinson very charitably, and very justly, rejects the fables invented at the time of the reformation, which state that the priests used to make this well flow with blood on particular festivals. It was evidently intended as a drain for the water falling from the church. Mr. Fowler, father to one of the vicars, fell into this well on a dark evening, 1764, and was drowned. The chapter thus warned of *their own danger*, had it covered.

"The third well was at the extremity of Westhorpe, and was called St. Catharine's Well, from a chapel contiguous to it, which was dedicated to that saint. The waters of this spring are said to be nearly the coldest in the kingdom. Within a century they were much recommended for their virtues in the cure of several complaints, particularly the rheumatism. A house was built here by Mr. Burton, of Norwood-park, the proprietor, about 1720, for the accommodation of persons who came to bathe; and many additions were made to the well, both of convenience and of ornament: over the head of the fountain was a plate, on which some Latin verses were inscribed, much to the honour of the tutelar saint and the reputation of the water. The extraordinary *purity* of both was the subject of the panegyric, and a participation of *this quality* was the promise holden out to those who came to seek

the protection of St. Catharine. The bath still remains little injured in its appearance, not at all so in its salutary qualities; but the deity of the place is left to lament the absence of her high priestess fashion, and the consequent diminution in the number of her votaries."

The reader will find, upon comparing the two editions of this work, that the author has made many *additions*; some of which, particularly the *tedious repetition* of conjectures upon styles of building, might have been greatly compressed; others are of undisputed advantage to the plan: to point out those, and bring parallels, would extend this review to an unpardonable length, but we cannot dismiss the history of Southwell without our acknowledgments to the author for laying before the public a vast variety of original and authentic articles, unknown to them before: these are generally judiciously arranged, though not uniformly so. Mr. Dickinson's style is clear and nervous, with the exception of some inelegancies, which are perhaps common to all topographical writers, imbibed insensibly by constant reference to the obsolete language of our ancestors.

The two parts contain 28 engravings, the first of which is a portrait of the author, who has omitted that of his father inserted in the first edition, which contains 14 plates, re-engraved in some instances for the present edition.

ART. II. *The History and Description of Colchester (the Camulodunum of the Britains, and the first Roman Colony in Britain), with an Account of the Antiquities of that most ancient Borough.* 2 Vols. 12mo. pp. 536.

THIS work comes under our cognizance in a very suspicious manner. Without an author's name, advertisement, or preface, we were at a loss for some time how to treat this unceremonious intruder; and the wording of the title rather excited our suspicion than our curiosity. This was increased upon reading the two paragraphs in the *first page*, where the writer rather ambiguously expresses himself in the following terms:

"Those whose researches unavoidably lead them to trace the intricate and doubtful mazes of remote antiquity, have such frequent illusions present themselves, that it is not much to be wondered at if the path is often mistaken which leads from the confused labyrinth of events to times wherein

conjecture and sagacity are equally useless. Whoever becomes thus bewildered and lost amongst the innumerable uncertainties which surround him, has no other way to extricate himself, than either to overleap, or cut a path through his wanderings, and at once escape the *labour and difficulty of a right judgment.*"

This curious kind of sophistry is not highly creditable to the author's talents, or to his honesty: for wherever difficulty or labour presents itself, we presume he would give us some random remarks rather than encounter any trouble to *investigate* a doubtful point of antiquity. Indeed this seems very evident from many passages in the work, wherein various transactions relating to the Anglo-Roman history are related with a degree of confidence and decision, which

no record or chronicle of those early events will justify.

Colchester certainly occupies the site of a grand Roman station; and that it was named *Camulodunum*, is admitted by the best informed antiquaries, though some few contend that this station was at Maldon. One argument seems sufficient to decide this point. Various urns, pavements, coins, and other Roman relics are continually found at the former town, but neither pavement nor urn has been discovered at the latter.

“Colchester,” observes this writer, “is placed upon an eminence, boldly rising from the north and east, its inhabitants enjoyed the variety of an extended view, with a dry soil; and to an elevation above the mists and vapours of the half surrounding valley, they had the additional advantages that no enemy could make an unperceived approach on those sides, nor advance without the hazard of an easy repulsion. To render the approaches on the south and west equally difficult to invaders, vast works and intrenchments were formed, effectually to prevent any attempts” (no fortification can prevent attempts, though it may secure a garrison) “either openly to conquer, or assault by surprise, the inhabitants of the small district they had enclosed; and of which Colchester was, *as it were*, the capital. These works, whether formed by the labours of the Britons (why not Britons?) or Romans, convey the most ample satisfaction of the importance of the place secured, and point out the consequence of its possession to have been considerable. Such great and visible evidences, as these may be called, are no where else so abundant: and one who has seriously mused over the whole scene, and formed his mind to a right understanding of the subject, cannot but receive a forcible impulse towards believing that the ancient state of Colchester has not been fabled. It is these external evidences of its antiquity, joined with the testimony gathered from antient authors, that has induced the learned to give it the appellation of *Camulodunum*: a city, in its time one of the largest in Britain, and the capital of the *Trinobanties*. The coins of Cunobeline, of which more have been discovered here, than in all the other parts of Britain together, point out this to have been his residence; and after him, it may be presumed, at least occasionally, of succeeding *Trinobantian* kings.”

The coinage of Cunobeline has furnished a theme for much dissertation and controversy by different antiquaries. Mr.

Pegge has written expressly on the subject, and Mr. Whitaker, in his profound History of Manchester, decidedly states, that Cunobeline “was the first monarch in the island that *minted money*.”

The author of the work before us enters pretty largely into the Roman transactions as connected with Colchester, and pursues them in a chronological series from the first invasion of the Romans to the time that they were superseded by the Saxons; Colchester then assumed a new character, and a new name; its form of government was also new-modelled, and partook of the customs and legal institutions of the Saxons. During the Danish incursions this town suffered repeatedly; and from its situation, strong fortifications, and vicinity to the sea, it became often the scene of siege and bloodshed. Indeed the history of this, and of most fortified towns, abounds with a horrid repetition of offensive and defensive operations. From the first landing of Julius Cæsar in Britain, to the time of Oliver Cromwell, our general and local histories record scarcely any events but those of a military and murdering nature, to which the principal contents of the first volume of this work bear ample testimony.

The siege of Colchester by Ireton, and the lamented fate of Sir Charles Lucas and Sir George Lisle are the most interesting of the military transactions. After the town had surrendered, these knights “were brought forth, and *without accusation, defence, or other preliminary form*, were ordered to be shot.” Sir Charles was a man of extraordinary courage and fortitude; to all the insulting taunts of Ireton and his colleagues, he looked and acted with that intrepid freedom and magnanimity which can only be known to the man of great and good mind. Instant death was denounced and put in execution, though request was made to suspend the tragedy till the following day; “that they might have leisure for the performance of their religious duties, and to arrange their temporal affairs. This reasonable request was harshly denied, and Sir Charles Lucas sharply replied to Ireton, that he would not have him think the petition was made from any desire he had to

\* The tenor of the history in Dio, p. 957—959, plainly shews Cunobeline to have been king of the *Cassii*, as well as of the *Trinobantii*; and *Camulodunum* was the capital of that monarch.

live, or escape the death designed him, for that he *scorned to ask life at his hand*, and should be soon ready for execution." After a short ceremony with Lord Capell's chaplain, the hour "drew nigh that called for a steady exercise of those principles of courage, indignant honour, and religion, which had led them thus far in their course without faltering. It was seven o'clock when they were led forth from the castle, and conducted to a green spot of ground a few paces from the wall on the north side of it. Here the three colonels, Ireton, Whalley, and Rainsborough, with three files of musketeers, had already arrived, and upon perceiving the knights advance, put themselves in order to perform their fatal work. Sir Charles Lucas coming forward took the appointed stand, at the same time saying, 'I have often faced death in the field, and you shall now see I dare die.'—Calmly kneeling down, he continued a few minutes in that humble posture of religious intercession, and rising with a cheerful countenance, hastily opened his doublet and pulled his hat on firmly. Then placing his arms at his sides, as in defiance, with a resolute indignation, called aloud, 'See, I am ready for you; now *rebels* do your worst.'—An instant discharge of the musquetry ensued, and four mortal wounds put an immediate end to his existence\*." Sir George Lisle immediately suffered the same fate, and their bodies were afterwards interred in a vault at St. Giles's church, Colchester, where their coffins are now to be seen.

The second volume of this work contains the local and parochial history of Colchester; in which every particular circumstance relating to the churches, monasteries, castle, police, tombs, &c. is minutely detailed. Among this mass of miscellaneous matter, we find a few relations of an amusing, and some of rather an interesting, nature.

The following historical particulars of the Colchester oyster may be considered among this class, by those who have a *taste* for the subject.

"The oysters which are the produce of this fishery, being so famous, it may not be improper to mention some particulars relating to them. They are of several sorts, of which the Pye-fleet is most in esteem, be-

ing a small thick oyster with a deep transparent shell. The creek in which they are found proceeds from the river to the Strood at the entrance of Mersea island. The number of oysters which are natives of this creek cannot be very great; neither can the whole produce of the river, with its various creeks, be anyways adequate to the vast quantities sold under the denomination of Colchester oysters. The great demand daily made for them has obliged the merchants to get oysters from other places, which they strew upon their layings; after these oysters have acquired a degree of fanness, they are not unfrequently vended as the native production of the fishery.

"Oysters cast their spawn in April and May, and about Midsummer and Michaelmas. This is called the spat by the fishermen, and cleaves to stones, oyster-shells, pieces of wood, and other things, at the bottom of the sea, all which they call cultch. The spat, when first cast, is like the drop of a candle, but no larger than a small spangle.

"It is conjectured that in twenty-four hours after, the shell begins to be formed. After the oysters have first spawned they are sick, but soon after begin to get well, and in August are perfectly so. The male oyster having a black substance in the fin, is termed black sick, and the female having a milky substance in the fin, they term white sick. When they take the oysters, they separate the small brood from the cultch, and then throw it in again; but if the spat is so small that it cannot be severed from the cultch then they are permitted to take the stone or cultch the spat is upon. The spat and small oysters thus taken, are spread upon places called beds or layers, near the edge of the river, where they grow and fatten; and in two or three years the smallest becomes oysters of the legal size. The size, is an oyster east in brass, which is kept by the magistrates, or water-bailiff.

"When the oysters have attained this legal size, they are removed from their layings, or beds, into pits cut in the marshes, where they fatten. Some of these pits communicate a green tinge to the fin of the oyster, which colour they acquire in a few days. The method of giving this quality to the pit is kept a secret, but there is little doubt to be made, that it consists in sowing the bottom of the pit with some vegetable, upon which, when it begins to spring up, the oysters feed. That this quality is communicated to the pit, and is not occasioned by the nature of the soil, is evident, for otherwise it would not be easy to account why a pit within a foot or two of a greening pit, shall not have the same quality. That it is owing to a cause not permanent is also evident, as a pit after a certain time loses

\* An ancient servant of Sir Charles Lucas, who was a sad spectator of this event, was surprised, through affection, with such passion for his loss, as earnestly to beseech death at the hands of the soldiers. *Loyal Sacrifice*, p. 78."

the power of giving a green hue to the oyster. It cannot be copperas, as some have imagined; for although copperas is green in the lump, yet when dissolved its colour is different; neither, were it not, is it easy to conceive such a dangerous mineral should be the food of an animal; or if it were, should not be easily discovered in the effects it would produce on those who had eaten of an oyster which received its colour from so pernicious a substance.

"The cultch being so necessary for the oysters to spat upon, it is made felony to carry it away after the month of May; and penalties are laid by the admiralty court upon those who destroy or carry it away at

any time. Notwithstanding which, while by the payment of a fine of five pounds or ten pounds the fisherman can carry out of the river, as much cultch and spat as is worth one hundred pounds, which is not unfrequently the case, it is not likely that their honesty, either to those who are entitled to dredge with them, or to the corporation who grant them licence, will stand so much in their way, as to prevent a practice which, although descended from father to son, and has not yet met with its adequate punishment, can make no better claim to exemption from it, than many practices for which the culprit undergoes the severest rigour of justice."

ART. III. *The Student's Guide; being a concise Account of the honourable Society of Lincoln's Inn: containing the Forms of Admission, keeping Terms, performing Exercises, Call to the Bar, Admission to Chambers, of leaving the Society, &c.* By THOMAS LANE, Steward. 8vo. pp. 96.

THE society of Lincoln's inn has long been celebrated for the antiquity of the foundation and the eminence of its professors; exclusive of the interest excited by magnificent buildings and large domains, disposed with the greatest effect. Indeed the importance of the inns of court throughout London, has frequently excited the attention of authors. Our excellent antiquary, Sir William Dugdale, followed the indefatigable Stowe in his researches, but as the diffusion of knowledge was infinitely greater in the time of Sir William, he found more would be required than a mere repetition from his predecessor, and therefore commenced his *Origines Juridicales*, which was published in folio, 1666. This work goes to the very spring-head of law, and from that head he has followed the course of the stream in all its meanders, till he accomplished a beautiful plan, which has been found so correct and excellent that all his successors in the pursuit have adopted it as an unerring guide. Every publication treating of London, silently acknowledges this fact, discerned throughout all the veils afforded by the transposition of words. His information may be perceived lurking in "The History and Antiquities of the Inns of Court," 8vo. 1780; and Ireland's "Picturesque Views, with an Historical Account of the Inns of Court in London and Westminster," large 8vo. 1800, contains whole pages extracted from the *Origines Juridicales*.

The object of Mr. Lane was far different: he perceived, from his official situation, that many inconveniences

arose from ignorance of the preliminary steps in applying for admission to the society, and ascertaining the precise duties required from its members. The rules were certainly before the public in a variety of publications, but in every instance encumbered by matter totally irrelevant: his little work was compiled, therefore, to bring into one view all that the student should know; and this he appears to have done concisely and clearly, as the following extracts and analysis of the contents will shew:

"In the arrangement of the following information for students, its utility only has been consulted.

"Had the work required superior intelligence, or profound ingenuity, the writer is too conscious of his own deficiency in either to have attempted the task.

"Indeed, the rules, regulations, and customs, here introduced, require only that plain language, of which this work consists; nor could they be interspersed with anecdote to interest, without, in proportion, detracting from the main object in view.

"At the conclusion will be found a considerable list of persons entered at Lincoln's Inn, whose names are illustrious in the page of history, or venerable in the volumes of jurisprudence.

"To detail the signal benefits conferred on their country by those eminent characters, would as far exceed the writer's intention as it would surpass his humble capacity; but to enumerate the high stations awarded to their talents and virtues, may prove a stimulus to honourable exertion, and awake emulation in the mind of the student desirous of aspiring to similar distinction."

Authors so rarely estimate their own abilities in this humble way, that we are often under the necessity of checking

their vanity ; but Mr. Lane is too fearful of presuming, and perhaps permits his fears to overcome a wish of extending his account of this honourable society. Such an account from a person of his abilities and peculiarly favourable situation, accompanied with biographical anecdotes, would undoubtedly be very acceptable to the public, who certainly would amply remunerate him for his expences and labour.

Mr. Lane enters into a short but satisfactory history of Lincoln's Inn, which is composed of the old buildings, the garden, Serle Court or New Square, and the stone building. "It is situated in a street anciently called New Street, or Chancellor's Lane, (from the rolls office being situate there) but now called Chancery Lane."

The order of black friars had a monastery in Holborn, which having fallen into decay, that and the palace of Ralph Nevil, bishop of Chichester, built on a piece of ground granted to him by Henry III. were converted into Lincoln's Inn.

"Afterwards Henry Lacy then Earl of Lincoln, became possessed of it, and resided thereon, and from thence it derived its name; for we learn, that about the beginning of the reign of Edward II. being partial to the study of the law, he first engaged its professors to settle here.

"The succeeding bishops of Chichester, whose inheritance it was, let leases to law students, reserving a rent and lodgings to themselves on their coming to London.

"Francis Syliard, a bencher in the time of Henry VII. had a lease thereof, when Robert Sherborne, then bishop of Winchester, granted a new lease to William Syliard his son, then a student, for ninety-nine years, at 6l. 13s. 4d. per annum, which ended in 1634.

"Richard Simpson, a succeeding bishop of Chichester, in 1536, passed the inheritance thereof, and of the garden called Cotterel garden, at Coneygarth,\* to the said William Syliard and Eustace his brother, which grant was confirmed by the dean and chapter, William being then one of the ushers of Henry VIII.'s bed-chamber.

"Eustace; surviving Edward his son

and heir, by deed of the 22d of Elizabeth, conveyed to Richard Kingsmill and other benchers, this house, garden, &c. in fee, whereupon a fine was levied by the said Edward and his wife.

"Thus far relates to the whole of the Inn, excepting what is denominated Serle Court, known by the name of the New Square."

The buildings of which this is composed were erected by the person just mentioned, on Fickett's Field, or Little Lincoln's Inn Field. Disputes having subsisted between this Henry Serle, Esq. and the then masters of the bench, articles were entered into by the parties, 34th Charles II. which set them at rest for ever: of those Mr. Lane gives an abstract.

"The buildings within the Inn which require particular mention are,—the chapel—the hall—the stone building—the library. The chapel was built by Inigo Jones, completed in five years, and consecrated in 1623, by George Mountain, bishop of London.—Internally it is decorated with painted windows, representing the prophets and apostles, the arms of a few noblemen, and the treasurers successively from 1680 to the present year.

"The cloisters underneath are much admired, and have of late years been railed in: the ground, being the burial-ground of the society, is now reserved for the interment of the benchers only, by an order made in July 1791; the place being too small for a general burial ground. Here Thurlow, the secretary of state to Oliver Cromwell, lies buried with an inscription on a flat stone.

"The roof and Gothic window at the east end of the chapel, were completely renewed about ten years since, and other repairs added, under the direction of Mr. Wyatt.

"In 1658, Henry Colfer, Esq. of this Inn, devised 12l. per annum for ever, for a sermon to be preached in Lincoln's Inn chapel, the first Wednesday in every month (which is regularly performed), and 8l. per annum for certain charitable purposes. In 1768, a lecture in the form of sermons, was founded by the bishop of Gloucester (Dr. Warburton), late preacher to the society, for proving the truth of the Christian religion, from the completion of the prophecies in the Old and New Testament. To be preached the first Sunday after Michaelmas term, and the first Sunday before and after Hilary term annually, (which duty is regularly performed pursuant to the directions of the founder.) A preacher and chaplain are appointed by the society, and divine service regularly performed

\* "So called from the quantity of rabbits, for we find in the 8th of Edward IV. the 12th Henry VII. and 24th Henry VIII. strict penalties on the students hunting the same, with bows, arrows, or darts."

on Sundays, as well as on the usual days appointed by the church.

"The hall, sixty-two feet long and thirty-two feet broad, was built in the time of Henry VII. The interior is spacious and well-proportioned. At the upper end is a fine picture by Hogarth, (14 feet by 10 feet 6 inches) representing Paul before Felix; and on the windows and pannels round the hall, the arms of the various law dignitaries (a list of which is subjoined) former members of this society.

"Its exterior has lately been repaired, and completely covered with patent stucco composition, in imitation of stone.

"The stone building forms only part of a more spacious design, by Sir Robert Taylor, who was the architect, and under whose direction it was built in 1780. These chambers, from their magnificence, let and sell at high prices; but very good chambers may be had in different parts of the Inn, (by applying to the steward) on very reasonable terms, either on purchase or to rent. The chambers in the stone building are held upon leases, dated June 1780, for 99 years and three lives named at the time, with power to nominate a fourth at the death of the last, transferable during life on payment of a fine of 10l. for each set of chambers.

"The rooms in the stone building command a noble view of Lincoln's Inn Fields, one of the largest squares in Europe, containing about eight acres of ground, forming the size of the base of one of the Egyptian pyramids, and is now laid out upon a very improved plan."

It is a singular circumstance, marking both the antient and modern history of this square, that every attempt suggested for its improvement, by public spirited individuals, has been rendered abortive by avarice, or want of taste in the trustees. A more dreary blank never disgraced an opulent city than the area of Lincoln's Inn Fields. This seemed to invite a building of magnificent proportions, and such was proposed more than one hundred years past, to serve as a parish church; that failing, Drury-lane play-house might have been transferred there, or St. Clement's church, from the strange situation

in which it now stands; but No, no, no! has proved the invariable reply to every plan, till the auspicious year 1802 introduced a thousand diminutive bushes, and a number of circular and right-lined gravel-walks, which a singular fatality in the surface prevents the passenger from beholding, except in partial glances.

"The whole of Lincoln's Inn is extra parochial except a part of Serle court, and most (if not the whole of the chambers) entitle the proprietor to a vote for the election of a member of parliament for Middlesex or Westminster."

"The library occupies an elegant suite of apartments on the ground floor of No. 2 in the stone building, and is open from ten o'clock until two every day for the use of members of the Inn. The collection of books is extensive, containing about eight thousand volumes, and which are increasing annually. It has many valuable MSS.; is ornamented with a few very good pictures, among which are landscapes on copper by Brughel, and portraits of Lord Chief Justice Hale, and Lord Chief Justice Rainsford; there is also a fine marble bust of Cicero."

Furnival's Inn is an Inn of Chancery, and an appendage to Lincoln's Inn: it was purchased by the society 1st Edward VI. and let on a lease which is now nearly expired.

Thavies Inn belonged to Lincoln's Inn, but was sold in 1769, afterwards burnt, and rebuilt like a street.

After giving a general account of the place, Mr. Lane proceeds to the principal object of the work, which is too dry for amusement, but extremely useful to any person wishing to enter the society.

The commons, or public dinners, are provided every day during term in the hall, where students may dine for 1s. 9d. each, who receive a black gown from the porter in the lobby, paying 2s. 6d. for it the first term, and 1s. each term afterwards.

The meat and vegetables are served in messes for four persons. The students sit at the side tables, and the benchers and barristers at the cross tables.

ART. IV. *The History and Antiquities of Pleshy, in the County of Essex, the Seat of the High Constable of England.* By RICHARD GOUGH. 4to. pp. 195. Appendix 132.

WHEN we take up the production of an author, whose life has been principally devoted to one particular branch of study, and also know that he possesses the combined advantages of an ample fortune, a learned education, a profuse library, and all the desirable adventitious requisites to produce an excellent, and nearly perfect, book, our expecta-

tion and curiosity are greatly excited; we eagerly anticipate an intellectual feast, and prepare the mental appetite for a rich repast. But, if instead of the anticipated treat, we become nauseated, our disappointment and displeasure excite complaint and reprehension. The former of these sentiments was excited upon our first view of Mr. Gough's his-

tory, and, we are sorry to acknowledge, that a tedious perusal provoked the latter. This learned author possesses all the advantages above enumerated, and the public are entitled to expect greater excellence from him, than from the generality of topographers: but when an author sacrifices his public duty, to his private partialities, then his writings abound with theory instead of fact, and dissertation instead of description. The works of Stukeley, Rowland, Borlase, King, Gough, and a few others, are notorious examples of this. In the writings of the latter antiquary, are displayed an extensive knowledge of his subject, much reading and research, but a deficiency of that taste and judgment which adorns and enhances works of genius and talent. Like many enthusiastic antiquaries, Mr. Gough has been often the dupe of imposture, and given currency to fabricated stories. Some of these have been confuted in the *Gentleman's and European Magazines*; and others will be detected by future topographers. Though we wish to guard our readers against the fallacious statements of Mr. Gough, yet we readily and gladly allow him much merit in the execution of his "British Topography," and his splendid, ponderous, and expensive "Sepulchral Monuments." The latter will prove a lasting memento of his perseverance and research, and also of his eccentricity and credulity.

In the *History and Antiquities of Pleshy*, we expected a long account of some curious, or important remains, which characterize this part of Essex; but the reader will readily judge of our disappointment, when we inform him that not *forty* pages are strictly appropriated to local description. Nearly the whole of the volume is occupied with anecdotes of, and observations on the life of Thomas of Woodstock, Duke of Gloucester, sixth son of Edward the third, high constable of England, and who occasionally resided at Pleshy castle. This nobleman is made the hero of the volume, and as all heroes are generally drawn with every advantage of light and shade; so is this of Mr. Gough's. Contrary to the evidence of all our English historians, he is here represented as a "patriot, a magnanimous and generous councillor," &c.; and his merits and virtues are the theme of 144 quarto pages.

In the small portion of this work which bears any relation to the title, it

is stated that Pleshy was "no inconsiderable *roman station*." Unfortunately for the antiquarian discrimination of its author, neither the character of the castametation, the discoveries made, the roads, or remains, will justify the assertion. If antiquaries thus indiscriminately appropriate encampments, or fragments of antiquity to the Romans, we may as well give up research and investigation, and unequivocally pronounce the character and era of all ancient remains.

Having said thus much of our author in general terms, we now bring him before the reader in the following extracts from the *preface*, which is the best part of the work, being written with more care, and containing more unequivocal information than all the subsequent part of the volume.

"It is impossible," says Mr. Gough, "to view the site of PLESHEY, or to trace its history, without entering into that of its lords; and the history of THOMAS OF WOODSTOCK is a history of the first twenty years of the unfortunate reign of his nephew," (Richard II.) "and a key to the misfortunes which overwhelmed him in the two last. We behold, in Gloucester, a stern *inflexible patriot*, who, if he panted for the fields where so much glory had been won from France by his father and brother, was far less blameable than those whose ambition engaged the country in expeditions of conquest against Portugal and Aquitaine, and wasted the hard gotten treasure in unjustifiable claims to other sovereignties; while the war with France and Scotland was still on their hands, and rebellion advanced in the centre of the capital. The minor king's high conceit of his own abilities, were heightened by the flattery of favorites, and drowned in empty parade, which swallowed up his revenues. These favourites were Alexander Neville, archbishop of York; Robert de Vere, earl of Oxford, a young man of spirit, misapplied in debauchery; Richard de la Pole, son of a rich merchant of Hull; and judge Tresilian, who never wanted reasons to countenance the king's wishes. These preyed upon the king's liberality, and were amply rewarded for their insinuating counsels, while those who managed public affairs, and bore the weight of government, were lightly recompensed. Not that Richard wanted liberality whenever it was called upon, but he was inspired with jealousy against his best friends, and recurred to the basest expedients to deliver himself from their remonstrances. Lancaster's conduct had not ingratiated him with the people, while the *firm patriotism* of Gloucester, recommended him powerfully to them, and while he, on the other hand, supported their remonstrances. It is easy to conceive how such a man must be looked

upon in the flippant, unsteady court of Richard, in which French counsels gained a complete ascendancy.

"That we have few historians of Richard's reign, is ascribed by Hearne,\* to the influence of the House of Lancaster in the reign of Henry VI. A monk of Evesham is the principal writer of his life taken singly; but enough will be found in the general histories of Walsingham and Froissart, to justify the opinion of the weakness and folly, not to say the wickedness of his conduct. That he might have been trained by Sir Simon Burley and the Earl of Warwick, to be the most accomplished prince of his time, and that his person rendered him the *prettiest* gentleman, is allowed on all hands: but that he wanted stability, understanding, and principle, is too notorious to be denied; that he would have been easily led, had he fallen into good hands, is confirmed by the ascendancy which evil counsellors gained over him. Holinshed is almost the first historian who speaks favourably of him; but it was reserved for those superstitious idolizers of kingly power, Hearne † and Carte, ‡ to extol his understanding, sagacity, and penetration, at the expence of his uncles and advisers.

"Perhaps no contemporary historian has set his actions in a truer light than the lively and inquisitive Froissart, who omitted no opportunity of satisfying his curiosity, and whose impartiality has been proved beyond contradiction.§ In this view large extracts have been here made from his history, which

I am sorry to say, has been so disfigured in all the editions hitherto printed, that it was necessary to have recourse to a beautiful manuscript copy of it, in the Royal Library now in the British Museum, in six volumes, folio, marked 14 D. I—vi., and illustrated with several beautiful illuminations, (of which two are here engraved from drawings made by the late Mr. Joseph Strutt, when he was selecting his Royal Antiquities from that valuable collection,) and from another beautiful manuscript, marked E. 11. in the same library, bound in green velvet. It is by no means improbable that these volumes were part of the ancient library of the king of France, in the Louvre tower, collected and augmented by John, Charles V. and VI., and in 1425, when the English made themselves masters of Paris, purchased for 1200 francs, by the duke of Bedford, regent, to be carried into England.||

"This manuscript deserves to be carefully collated with the latest edition, by Sauvage, Paris, 1574, folio;¶ where among many other inaccuracies, the proper names of persons and places in Great Britain, are grossly misrepresented, and equally so those of other nations.

"The original orthography is retained in the manuscript, and the only difference is in the division and titles of the charts, a difference which Le Carne observed in the different manuscripts in the French king's library. The hope of seeing a correct edition of this historian from his countrymen, and a faithful translation from one of our own; for-

¶ Froissart's History was first published by Anthony Verard, at Paris, without date, three volumes, folio; by Michael le Noir, Paris, 1505, two volumes, folio; by Galleot du Pre, Paris, 1530, three volumes, folio; by John de Tournes, Lyons, 1559, 1560, 1561, three volumes, folio; revised and corrected by Denys Sauvage. This last was exactly copied by one at Paris, by Gervais Maillot, 1574, three volumes, folio. To these editions, Mr. Johnes adds others in his own possession. 1. By Guill. Eustace, Paris, 1514; 2. an edition by Denys Sauvage, printed by Michael Sommes, Paris, 1574. This I have, but the volumes are rather books making one sizeable volume. 3. Another edition, by D. Sauvage, printed for Michael de Royney, Paris, 1574.

"Sauvage acknowledges that he printed from the three first black letter editions, and two manuscript abridgements, making some alterations from better historians, "to give a meaning to passages which were in want of it," placing the original reading in the margin, and leaving names of persons and places unaltered; "from the impossibility of correcting them with success." With regard to the language, besides his intention never to change any thing of the ancient words, he accompanies them with an explanation whenever he thinks them not sufficiently intelligible, not always indeed successfully, but illustrating his chronology, geography, and facts, in notes from historians, maps and records. In the public library at Paris, are upwards of thirty folio volumes, containing separately, some one of the four books into which this history is divided; some illuminated with miniatures. Many manuscripts have been written in England, or destined for that country, since the author is represented as offering his book to its king and queen.

"Mr. Johnes observes, p. 206, "M. de S. Palaye is ignorant how rich this country is in manuscripts of Froissart. There are many magnificent ones in the British Museum, at Oxford, Cambridge, and in other public and private libraries. I have in my library not less than six, but not one is a complete history."

bids me expatiating any further on this head.

"FROISSART appears to have been a man of gaiety and curiosity from his earliest youth. He had scarcely attained his twentieth year, when he was engaged by his dear lord and master, Sir Robert de Namur, Knt. lord of Beaufort, to write the history of the wars of his own time. Four years afterwards he went to England, and presented part of his work to queen Philippa, sister to the wife of his patron, who made him clerk of her chamber, and encouraged him to travel to various parts of Europe for information. He appears to have been in England in 1361 and 1363, six months in Scotland, and part of the time in Wales. His royal patroness died 1369, while he was absent, and he did not return to England till twenty-seven years after; viz, in 1395, taking advantage of the truce between the two nations, and furnished with letters of recommendation to Richard and his uncles. The former he gratified with an amorous novel, splendidly bound and illuminated; and received from him in return, 100 rubles, equal to about 25 guineas of our present coin, in a goblet of silver gilt, weighing two marks: the king having previously proposed to continue him of his household; while the nobility and persons about the court, took pains to inform our traveller in the transactions of the reign, particularly the conquest of Ireland. In relating the melancholy end of Richard, 1399, he acquits himself most gratefully to his prince, by the affecting manner in which he laments his misfortunes. At the same time he remarks, that in this event he saw the accomplishment of a prediction which had been made at his birth at Bourdeaux; and also of a prophecy in the romance of Brutus, by Wace, which pointed out the prince that would destroy him. He does not seem to have long survived, dying within two years after, at the age of sixty-four, having been born at Valenciennes, about 1337; and having been priest, canon, and treasurer of the collegiate church of Chinay, and rector of Lestine, where he frankly confesses the tavern-keepers had 500 francs of his money, during the short time he held this valuable benefice. He was an amorous poet, a pleasant, but often too credulous historian, and a jolly priest. His history extends from 1326 to 1400, and comprehends the events of his own time in every part of Europe, and even of Turkey and Africa: divided into four volumes, and these again into chapters; and in some manuscripts, the first volume is divided into four, six, or eight parts. Froissart's materials for the history of England, were of the most genuine kind. He lived in habits of intimacy with John earl of Hainault, who had afforded protection to the queen of Edward II. when her own brother, Charles the Fair, king of France, was obliged to order her out

of his dominions, and her son, afterwards king Edward III., married the daughter of her protector, which princess afterwards became patroness of our historian, who had the additional advantage of being eye-witness of many of the facts he relates, and has been charged with partiality to England, and hostility to France; from both which charges he has been vindicated by his biographer, Palaye, an agreeable abstract of whose work has just been published in English, by Mr. Johnes.

"Froissart was a favourite book of Mr. Gray, who thought it strange that people who would give thousands for a dozen portraits (originals of that time) to furnish a gallery, should never cast an eye on so many moving pictures of the life, actions, manners, and thoughts of their ancestors, *done on the spot, in strong, though simple colours.*\* He considered him as the Herodotus of a barbarous age; *had he but had the luck of writing in as good a language, he might have been immortal.* His locomotive disposition, (for then there were no other ways of learning things) his simple curiosity, his religious credulity, were much like those of the old Grecian.†

The following passage, from the first page of our author's history, will show that fancy and conjecture are substituted for judgment and discrimination.

"Among the various monuments of antiquity, which abound in these kingdoms, few perhaps afford so much scope for *fancy*, as well as matter of history, as the venerable site of Pleshy castle. The stupendous keep, amazing ditch, and magnificent bridge of one brick arch, must strike the most superficial spectator."

Don Quixote's *dulcinea* had, to him, a thousand charms, and a thousand beauties, which no other person could discover. Pleshy seems to be the *dulcinea* of Mr. Gough; we are not, therefore, surprised at the hyperbolical terms he employs to characterize it, but when we assert that its "*magnificent bridge*," is a plain, unornamented, simple pile of *arched brick*, and that the "*stupendous keep*" is a mole hill, compared to those at Marlborough, at Old Sarum, at Oxford, and many other places we could mention; our readers will agree with us, that great reliance is not to be placed on such descriptions. Let us see the continuation of the passage.

"But on a closer inspection," observes Mr. Gough, "this spot will be found to furnish some new lights for the illustration of our national antiquities. We may perhaps

\* Mason's *Memoirs of Gray*, p. 275. 4to.

† *Ibid.* p. 392.

here trace the progress of fortification among us, from the Roman to the Norman times. If the particular enthusiasm with which I feel myself inspired, when

On pilgrimage Time's traces I pursue  
The relics of these traces for to see."

"I will be bold to affirm, that few places afford more ample speculation to an English antiquary, than this residence of our High Constables of England, for four centuries from the conquest."

Having described, what the author calls, the roman fortification; and stated that some "human bones, a *bit of iron*, a stone coffin, a glass urn with bones in it, and some *tessellæ* of pavements," have been found here: he proceeds to describe the proprietors of the manor, to William Mandeville, 1180. "From this time," says our antiquary, "we must *probably* date the Norman fortification of this place. A simple vallum and ditch *had rendered* this station tenable against the *savage natives* in the Roman times, when it probably made a part of a chain of stations through the heart of this county from the sea." If the author knew any thing of this *chain*, he should have pointed out a few links of it, to satisfy the readers curiosity; instead of which, this gentleman, with the generality of topographers, principally narrates a catalogue of names, of *marriages*, and *intermarriages*, with *births*, *baptisms*, and *deaths*.

Similar matter continues to the tenth page, when we take leave of Pleshy; and the history of Thomas of Woodstock, sixth son of Edward III. commences, and occupies the intervening pages, to 155. In delineating the character of this nobleman, our author has used colours which we presume will not stand the test of investigation; but like some of the experimental colouring of the great Sir Joshua Reynolds, will evaporate with time. The duke of Gloucester, though possessing considerable abi-

lities, and ambitious of popularity, was of a turbulent, crafty, haughty disposition: Dr. Henry, in his History of England, says, "He seldom came to court, but to insult his sovereign; not to council, but to thwart his measures. Though he had received grants of immense value from his nephew, (Richard II.) he was constantly engaged in factitious machinations, to disturb his government," &c. This character from the Doctor coinciding nearly with those given by other historians, make us suspect, that partiality, not judgment, has guided the pen of our antiquary. In giving an account of his murder at Calais, he has quoted copiously from Froissart, Bouchier, Sandford, &c., and has had a print engraved, representing the event. According to Froissart, the Duke was strangled with a towel "twisted round his neck, and drawn at each end by two men." He was afterwards "honourably embalmed, and put into a lead coffin enclosed in another of wood, and thus sent by sea to England." The corpse was landed at Hadleigh Castle, in Essex, and buried, *first* in his collegiate church, at Pleshy, afterwards removed to Westminster, before 1399: for in that year his "dutchess, by will, dated August the 3d., desired to lie by him." In a subsequent page, Mr. Gough says, "the dutchess survived her lord about two years, and made her will on the 9th day of August, 1399." The latter is the *date* of her will, as recorded in the collection of royal and noble wills, published by J. Nichols. Our author proceeds to relate the marriages, connections, &c., of the duke's children.

A long appendix of 132 pages, contains copies of grants, licences, statutes of Pleshy college, deeds, and other instruments. The volume "is embellished" with fourteen plates, which for drawing and engraving, would even disgrace Mr. Grose's Antiquities.

ART. V. *The Gazetteer of Scotland; containing a particular and precise Description of the Counties, Parishes, Islands, Cities, Towns, Villages, Lakes, Rivers, Mountains, Vallies, &c. of that Kingdom, with an Account of the Political Constitution, History, Extent, Boundaries, State of Agriculture, Population, Natural History, Buildings, Seats of the Nobility and Gentry, Roads, &c. illustrated with an elegant Map.* large 8vo.

THIS gazetteer is, without exception, the best that has ever come under our cognizance, and we feel much pleasure in bearing testimony to its general merits and utility. Good gazetteers and good

dictionaries are among the greatest desiderata of literature; they are the grand repositories of collected facts, and registers of unequivocal information. Thus completed, the learned may resort to

them with confidence, and the young student with constant advantage. The most learned authors have usefully applied their time and knowledge to the compilation of orthographical dictionaries; but no able writer has ever yet executed a geographical or topographical dictionary. We know it is an arduous and tedious task, which would scarcely remunerate a man of talent for his time and exertion; and when completed, would be characterised by the fastidious critic, as a work of mere compilation and mechanical drudgery. It therefore gives us pleasure to see the work before us executed so respectably; and if we cannot give it unqualified approbation, we shall be very lenient in censure. The topography and antiquities of Scotland have been more fully described than those of England, Wales, or Ireland; consequently the task of arranging the whole in alphabetical order is greatly facilitated. The laborious and circumstantial statistical history, edited by Sir John Sinclair, with the many scientific and miscellaneous works, exclusively written on Scotland, constitute a substantial and permanent basis for such a publication as the present. And it is no small degree of praise to say, that the editor seems to have made a judicious use of these materials.

The gazetteer is preceded by a long introduction, in which the editor has concisely narrated the most prominent and characteristic circumstances, relating to Scotland in general. From this part of the work we intend to make different extracts, which will serve to exemplify the writer's style and manner, and also afford much condensed information concerning this part of Great Britain.

"Scotland is bounded on *all sides* by the sea, *except* on the S.E. where it is joined to England." This is rather an unpropitious beginning, where the writer *contradicts* himself in the first sentence; but many *fine* writers are guilty of this vulgarity.

"Scotland is about 280 miles in length, from the Mull of Galloway to Cape Wrath; and at the greatest breadth, from the Point or Ru of Ardnamurchan to Buchanness, 180 miles; but the land is so indented by arms of the sea, that the breadth is exceedingly various, and no part is distant above 40 miles from the coast." Next follows a particular description of the coasts, including some account of the friths and bays. By this

we learn, that the northern coast is generally "bold and dangerous, jutting out into formidable rocky promontories, and divided from the Orkneys by a narrow and tempestuous sea, named the Pentland Frith. The whole of the western shore seems torn and shattered by the fury of the waves, and is every where indented by extensive arms of the sea; while in every part innumerable islands are seen, which appear as if they had been detached or torn from the main land by some convulsion of nature."

In describing the *surface* of Scotland, the writer says, it is estimated to contain an area of 27,794 miles; which by the report lately made to the board of agriculture, comprehends 12,151,471 acres of cultivated, and 14,218,224 acres of uncultivated lands. The remainder of the surface is occupied by lakes and rivers. Scotland is naturally divided into the two great divisions, of *highlands* and *lowlands*, (of which particular accounts are given in the gazetteer.) It is also divided into three parts, called the north, middle, and south divisions, whose boundaries are strongly marked by nature.

"In the northern division, the face of the country presents nothing to the eye but an assemblage of vast mountains; bordered, however, on the N. N.E. and E. coasts, with vales and level tracts of considerable fertility. The middle division also contains many great ranges of mountains, particularly the Grampians, which extend from Aberdeenshire, in a S. W. direction, to the Atlantic. In these two divisions, which comprehend more than two thirds of Scotland, the arable ground bears but a small proportion to the mountainous regions; of which the ruggedness and sterility will ever in a great measure defy the efforts of human industry. The country, on the eastern coasts of the middle division, and in a great part of the southern, bears more resemblance to England, and the proportions of the cultivated to the uncultivated, are a third. In the southern division we find every sort of rural variety."

Some account of the *mountains, lakes, rivers, and forests*, follows. Under the latter head we find, that the ancient forests of Scotland have been greatly diminished, and few plantations substituted in their place.

"Of the antient *Sylva Caledonia*, or Caledonian forest, the most considerable remains are in the districts of Marr and Glentanar, in Rannoch, in Glenmore, and Strathspey, and in Alfary, in Ross-shire. The fir is the most common wood; but the oak and other deci-

duous trees are not wanting. These forests, some of which extend no less than 30 or 40 miles in length, would doubtless be a source of great riches to the proprietors, and to the country at large, did not the want of roads, and the distance from the sea, preclude the possibility of land carriage; and the plan of floating down the rivers is not so practicable, owing to the risk of being shivered by the frequent and high falls. Notwithstanding these obstacles, however, several companies have succeeded in floating down the Spey and Dee, by cutting canals where the falls are so high as to injure the wood."

The climate, soil, water, and vegetable productions, are described under separate heads; and we are pleased to find, that the Scotch nobility and gentry have emulated their English neighbours, in establishing "the Highland Society," for the promotion and encouragement of agriculture.

Premiums are given for the cultivation of waste lands, for advancing the breed of black cattle and sheep, and for promoting other important objects appertaining to agriculture. The nobility and yeomanry of the country, not only set laudable examples of improvement, but encourage it in others. "Still," says the editor, "from the well known principle of human nature, the reluctance to change old customs, and to relinquish habits sanctioned and established by time, an almost insuperable obstacle is presented to general improvement. This aversion to new plans, or, as they are termed, 'innovation of established customs,' is now wearing off; and it is hoped, from the improvements already introduced, and the exertions of the board of agriculture lately established, that a spirit of improvement will be diffused, which will surmount any obstinacy that remains, and make the practical farmers open their eyes to their true interests. Let them be taught, that the number of true citizens, and not the extent of territory, is the true criterion of national wealth; and that the increase of population can be supported only by resources drawn from their own territory, raised and augmented by the improvement of agriculture." In speaking of this subject, we could almost adopt the words of a late author, in a survey of a county given in to the board of agriculture:—"Had I," says this almost enthusiastic writer, "the powers of persuasion equal to the conviction I have of the import-

ance of the maxim, I would proclaim it to my country, from the Point of Shetland to the Land's-end of England, until it were heard and understood, and felt by every man that eateth bread, that he who makes two ears of corn grow where only one grew before, does more good to mankind than the whole race of politicians together\*." The soil of Scotland produces wheat, rye, barley, oats, peas and beans, flax, hemp, hay, potatoes, turnips, carrots; and, in general, all the sorts of crops which are raised in the southern part of the island. Of late, many extensive tracts of waste land have been planted. In every district, the candid observer will find proofs of the illiberality of Dr. Johnson's account of Scottish trees, which has certainly been founded in ignorance, dictated by prejudice, and written without consideration.

The mineralogy of Scotland is concisely described, and the principal mines and minerals are mentioned. Though there are not many precious metals obtained from this part of the kingdom, yet, when "James V. married the French king's daughter, a number of covered dishes, containing coins of *Scottish gold*, were presented to the guests by way of desert; and it appears by the public records, that in one year there was coined in the mint of Scotland 48,000*l.* sterling, of *Scottish gold*." There are no silver mines at present, but much of this metal is obtained from the lead mines. "Of late, a very rich mine of antimony has been opened in Westerkirk, in Dumfriesshire, supposed to be richer than any at present known in the world. The other metallic substances hitherto discovered are cobalt, bismuth, manganese, wolfram, plumbago, and mercury; the latter in very small quantities. Limestone, freestone or sandstone, and slate, are found in every district in the greatest abundance. Of late too, some attention has been paid to the marbles, which prove *no way inferior* in colour or polish to those of Italy." These latter assertions savour too much of national partiality, which also depreciates many other parts of the book. A political or a geographical historian, should have a mind free from local and general prejudice; for wherever either appear, it excites suspicion and mistrust. Dr. Johnson, as already observed, and some other writers, have

\* Dr. Robertson's Survey of Perthshire.

caricatured Scotland and the Scots; and the latter endeavouring to vindicate themselves, have been rather free in egotism and praise. Either extreme is equally disgusting.

Under the heads of education and literature, we find some particulars, which account for the prevalence of school learning among the Caledonians. "The attention of the Scottish legislature was, at a very early period of history, called to the means of extending the views, and increasing the knowledge of the inhabitants; but the intentions of the government were greatly retarded by the influence of Romish clergy. When the reformation emancipated them from papal subjection, the inhabitants were soon distinguished by their enlightened sentiments and growing knowledge. The civil revolution, which took place shortly after, contributed to the same happy end. By these events, the means of instruction were laid open; many institutions were established for the improvement of the poor; and many benefactions were bestowed to reward the teachers, and to support the scholar." In the second session of William and Mary, an act of parliament was passed, "that there be a school and schoolmaster in every parish; his fee not under an hundred marks, nor above two hundred." These plans produced very beneficial consequences, and civilization and knowledge spread their benign influence through the country; schools became numerous, and the salaries tempted many to become masters. "The parochial schools, academies, and universities of Scotland, are comparatively cheaper than those of England," and learning and literature are more generally cultivated. This is a pleasing theme to the editor, who boastingly records a long list of eminent writers, all of Scottish origin. "Previous to 1763, literary property, or authors acquiring money by their writings, was hardly known in Scotland; but of late, the value of literary property has been carried higher by the Scots, than was ever known among any other people. David Hume received 5000*l.* for the six last volumes of his *History of Britain*; and Dr. Robertson received 4500*l.* for his *Charles V.* Dr. Blair received the highest price for his sermons, ever known to be paid for that kind of writing, the merit of which produced him a pension from his majesty of 200*l.* per annum. Even among the lower ranks, literature is not

a stranger; the cheapness of the fees in the parochial schools, and the facility with which education can be had in Scotland, give the peasantry a manifest advantage over the peasantry of England."

In describing the *commerce, fisheries, and manufactures* of Scotland, the author says, "they have for many years been in an improving state." To elucidate this, he gives a concise history of the Scottish commerce, from the union to the present time. The *constitution* and civil government are more fully detailed, and the "Introduction" is terminated with notices of some of the most considerable military and religious antiquities in that country. Among them Antoninus's wall, and numerous Roman camps are specified.—The latter, says this writer, are "generally distinguished from those of the Danes and Saxons, by being rectangular." This opinion, we believe, to be one of the common errors of antiquaries. It appears to us very improbable, that the Romans would occupy their time, in the midst of war, to form a *square* encampment, if a circular or oval one was already prepared to their hands. But some antient writers have said, it was the *usual practice* of these warriors to throw up their earthworks in a *certain form*; and later authors made that a uniform system, which must evidently be governed by circumstances. The concluding sentence of the introduction has our warmest wishes, for a speedy accomplishment.—"The intercourse between England and Scotland, is every day growing more frequent, to the mutual advantage of both. This has the effect of rendering the manners, dress, language, and, indeed, every particular alike; and of course we may anticipate, at no very distant period, the time when national distinctions and prejudices shall be known no more, and BRITAIN will form, as it ought to be,—only ONE NATION."

Having, in the preceding passages, given an abstract of the historical introduction to this volume, it will be sufficient to observe, that under the respective alphabetical heads, will be found a pretty circumstantial account of all the subjects enumerated in the title. Some of the articles indeed, we think are rather too minute for a work of this nature; and in describing objects of British, Roman, and architectural antiquity, we remark a want of discrimination and precision. At the end of the volume, is an

account of the population of each county and each district in Scotland; from which we are informed, that the whole amounted, in 1755, to 1,265,380; in 1790-8, it increased to 1,527,892; and in 1801, to 1,604,826; making an increase, in 46 years, of 339,446 persons. To this are added, a chronological table of kings, the peerage, the districts of royal boroughs which send members to parliament, the real and valued rent of Scot-

land by counties, the principal roads and fairs arranged under each month.—“The elegant map,” announced in the title-page, is very badly drawn and badly engraved. We often sought in vain for places mentioned in the description, and found that the spelling of places in the map and in the gazetteer, was often at variance; a circumstance which should be more strictly attended to by editors.

ART. VI. *The History, antient and modern, of the Sheriffdoms of Fife and Kinross; with a Description of both, and of the Firths of Forth and Tay, and the Islands in them; in which there is an Account of the Royal Seats and Castles, and of the Royal Burghs and Ports, and of the religious Houses and Schools, and of the most remarkable Houses of the Nobility and Gentry. With an Account of the natural Products of the Land and Waters. By Sir ROBERT SIBBALD, M. D. A new Edition, with Notes and Illustrations. 8vo. pp. 468.*

SIR Robert Sibbald has had the honour of leading the way in the arduous undertaking of elucidating the history of his native country. That he has produced a work worthy of its patronage is implied by the republication of this volume at the present more enlightened period; he introduces the following words in his epistle to the reader.

“This history and description of Fife and Kinross, courteous reader, is a specimen I was desired to give of what I had done by the commend of King Charles II. in the description of North Britain, ancient and modern: it was not my blame that it is not accompanied with maps of them, but theirs who ought to have seen that done. I have supplied that want as well as I could, by a particular description of the most remarkable places, and by lists of the heritors ancient and modern.”

The work contains four parts, and an appendix. The first describes the antient extent of the shire; its antient name; a description of the country in the time of the Romans; a character of the Caledonians termed Dicaldone and Vecturiones, and whence they emigrated; the language of the Picts; their manners, policy, and religious rites. The “actions and exploits” of the Romans in Scotland, and the wars of the Danes in the shire.

The second part treats of the firths of Forth and Tay, the islands of the former, the animals, the sanguineous fish, exsanguineous animals, and the minerals of both the firths, and the plants upon the firth of Forth, and some within the sea-mark; the natural history of the shire; the state of the christian religion,

and an account of the Culdees who first introduced it, “shewing how the Culdees were deprived of their rights,” and of the religious houses and hospitals in these shires.

The third division concerns the shire of Fife; the jurisdiction; the earls; and officers: Macduff the first earl, and the privileges he obtained of king Malcolm Kanmor; a list of the earls; the civil jurisdiction; list of bishops and priors of St. Andrews; of the clergy, nobility and gentry; officers of state of Fife; and an account of the university of St. Andrews. Next follows a history of Kinross-shire.

Part fourth. The coast from the western boundary to the river Leven, thence to Fifeness, thence to the river Eden; a description of the inland country east from the Lomonds, of the Strath of Leven, of Lochorshire, of the western parts inland of the plains of Eden, and of the northern parts inland.

The appendix contains the natural history of Fife; particulars concerning some natives of this shire eminent for learning and arts; antient heritors of the shire; new list of the principal heritors, and of those of Kinross; Gordon's list of those of the former shire; houses of the nobility and gentry; the valuation of Fifeshire, 1695; list of the parishes, as divided into presbyteries, with the names of patrons and incumbents; list of the British kings; and, lastly, an account of the arrival and treatment of some ship-wrecked mariners and soldiers of the Spanish armada, at Anstruther.

The editor of this edition has collected a vast number of notes, which are in-

serted at the bottom of almost every page, from the most valuable authors who have written on Scottish history or antiquities, some emendatory, others illustrative and explanatory.

The reader who can understand the obsolete Scots idiom of the reign of Charles II. will meet with many curious and interesting particulars from the labours of the industrious Sibbald, who wrote many other works of value besides this history.

Of the author and this work, the editor gives the following account.

“ The style of Sibbald is inferior to his matter. Both in his Latin and English works, it is very often embarrassed and slovenly, to a degree that surprizes in a literary character of such eminence. He evidently wrote in haste, and was attentive in general rather to ascertain and state facts, than studious about the language employed in communicating them. Of his works, the History of Fife is one of the most esteemed. To the subject he was naturally partial, and on the illustration of it he bestowed more than common labour. He seems to have examined every

authority, printed and manuscript, within his reach, which was likely to throw light on any branch of his work. And there is a profusion of extracts in Latin, copied at length into the text, which, though it gives his pages a deformed and motley appearance, manifests his fidelity. In the modern part of the history, his own personal knowledge of the county, and his opportunities of obtaining information from his numerous friends and relations, who lived in it, and the exactness with which he has described such objects as are permanent, or that have happened to remain, give us perfect confidence of his general accuracy. Two editions of this work were printed at Edinburgh, in the author's life-time; and from the most correct of these, in 1710, the present one is carefully taken. It was thought proper (except where there is obviously an error of the press) to preserve the original spelling, which is by no means correct or uniform, as a mark of the unfixed state of this branch of literature in Edinburgh in the beginning of the 18th century.”

The volume is embellished with four neatly engraved plates by R. Scott.

ART. VII. *Memorabilia Cantabrigiæ: or, an Account of the different Colleges in Cambridge; biographical Sketches of the Founders and eminent Men; with many original Anecdotes; Views of the Colleges, and Portraits of the Founders.* By JOSEPH WILSON, Esq. 8vo. pp. 358.

THERE has ever existed some degree of rivalry and jealousy between our two national universities. This has been strongly displayed in the contention about their respective claims to antiquity. Yet the unsophisticated page of history is sufficiently decisive to impartiality. Those who have written expressly about Cambridge university, (though very few) have thought they gave consequence to their subject, by referring its origin to a very early period. That it occupies the site of a Roman station, or *castrum æstivum*, of that people, is more than probable, but that its first college was erected and endowed previous to any at Oxford is a subject we submit to the investigation of those who have particularly studied the subject. Oxford has certainly many advantages over her sister university; and her history and antiquities have been more copiously and satisfactorily developed. Among the writings connected with that university is, Wood's *Athenæ Oxonienses*, which contains anecdotes and memoirs of all the learned and celebrated men, born or educated there. To imitate that work in a humble degree is the

object of Mr. Wilson, in this hasty little volume.

The author very humbly appeals to his readers, by stating,

“ It is not without the greatest diffidence that I submit this work to the public eye. I am fully aware that an *Athenæ Cantabrigienses* would have been too arduous a task for me to have attempted, notwithstanding the abundance of materials which may be found for such a work, in the voluminous collections of Mr. Baker, Mr. Cole, &c.; and the MSS. of Mr. Drake Morris, in the Harleian library, which seem tolerably complete, so far as relates to the archbishops and bishops who have finished their education at this university. That such a work, considering the copious fund of amusement and instruction it would afford, if properly executed, has never appeared, may indeed excite much surprize and regret; as no university has possessed a greater number of members more fully adequate to such an undertaking than Cambridge. That Dr. Richardson, Mr. Baker, and Mr. Cole had the idea, is evident from their collections, and it must ever be lamented that men so eminently qualified did not live to complete it.”

Knowing the vast mass of biographical materials collected, and left by

these gentlemen, we are much surprized and dissatisfied with the meagreness of the volume before us. Mr. Wilson has no justifiable apology for rejecting the stores that are laid open to him. The great collections in print and MS, by Mr. Baker, are readily accessible at the British Museum; where are also those amassed by Mr. Cole. The latter were bequeathed upon the condition of their not being made public till twenty years after the donor's decease. That singular injunction being fulfilled, the whole, consisting of sixty volumes, were lately opened for the inspection and advantage\* of those persons who wished to benefit by them. We fear Mr. Wilson is not one of them, or his memorabilia would have been more copious, more satisfactory, and more interesting. "All that I can hope on the present occasion," he observes, "is, that I have executed at least a more complete and entertain-

ing guide to the members and visitants of the university, than any which has yet appeared." That this work may be a little superior to the common "*Cambridge Guide*" we readily grant.

The contents of this volume may be divided into the four subjects of history, topography, description, and biography. In the three first it is unsatisfactorily concise, and often erroneous in dates and spelling. Its only claim to novelty or utility lies in the biographical sketches, wherein we occasionally distinguish a few touches of the improving pencil. Petit views of all the colleges, with slight portraits of the founders, are given in the volume; but the *whole of them* bear such striking marks of forgery, that they must not pass current through our hands. They are mere "*shadows of shades*," or, to express it more technically, they are slovenly *copies of copies*.

ART. VIII. *The Swansea Guide; containing such Information as was deemed useful to the Traveller, through the Counties of Glamorgan and Monmouth: from the Exemplifications of antient and modern Authors.* 18mo. pp. 198.

THIS little Cambrian guide contains a concise account of all the principal towns, villages, castles, abbies, and seats, with the natural and artificial curiosities, included within the two counties mentioned in the title. Of the latter county, the public have already had ample information in the history of it, by Mr. Williams, in Coxe's Tour, and in several smaller books; but the history and antiquities of Glamorganshire are but little known. What is contained in this small volume appears to be the result of personal investigation; therefore, though short, it becomes very useful. The author has not avowed himself, but we are informed he is the Rev. Mr. Oldisworth, Master of the Free Grammar School of Swansea; whose name we announce with some degree of pleasure, from the modesty and unaffected simplicity which prevail through the book. We trust the sale of it will tempt its author to make considerable additions to his account of Swansea, and to the whole of the county, but for the reasons above stated we would recommend him to omit the notices relating to Monmouthshire. From this guide it appears that Swansea is a flourishing town, and has greatly aug-

mented its commercial consequence, and its local trade within the last century. This has partly arisen from the various mines of coal and culm in the neighbourhood. The vast increase of its shipping will be seen in the following statement:—"Number of vessels in the year 1768 were 694, or 30,631 tons.—Ditto, in 1790, 1697 vessels, or 74,926 tons.—Ditto, from September 29, 1799, to September 29, 1800, 2590 vessels, or 154,264 tons."

Among other subjects of notice and celebrity, appertaining to Swansea, is Richard Nash, or Beau Nash, as he was commonly called. He was born here on the 13th of October 1673, and in a very early part of his life gave proofs of that volatility and gaiety, for which he afterwards became so distinguished. The writer of this Guide has related many anecdotes and particulars of this "king of fashion," exemplifying his polite urbanity of manners, which obtained him numerous friends, though his governing passion was gaiety and dissipation. At length settling in Bath, which even at the end of the sixteenth century was extremely poor and unfashionable, he accidentally obtained the

\* See an account of them, with the character of the collector, in the Monthly Magazine, vol. xvi. p. 23.

patronage and friendship of some of the *beau-monde*, who, in 1710, elected him master of the ceremonies at a small ball, then established in that city. It is curious to trace the history and connection of places with that of individuals. Bath is a remarkable instance of a city's attaining extraordinary fashionable celebrity, thro' the character and conduct of a single person. From the time of Nash's settlement there till his death in 1761, that city annually increased in buildings, visitors, conveniences, and luxuries, and his memory is perpetuated by a statue, inscription, portraits, &c. Swansea is also ranked among the list of summer bathing places; and, according to the number of lodging-houses, &c. we may conclude it is much frequented. "The bay," observes our author, "is universally allowed to be singularly beautiful, and the shore very commodious for bathing, as the great influx of company for many years for that purpose sufficiently evince. The town, in consequence, has undergone many capital improvements; and the new pier, as it is of admirable advantage to the harbour of Swansea, so it is with the adjoining barrows, a most pleasant promenade, comprehending much beautiful scenery."

Among other subjects particularised in this town is, "the Cambrian pottery" established here, on Mr. Wedgewood's plan. Its mode of manufacture is described in the following terms. "The clay made use of is brought from various parts of England, which is afterwards mixed with flint very finely ground; and after it is well blended in water it is passed through sieves till all the coarser particles are lost, then exposed to heat, which evaporates the water and leaves the clay (after it has been well beaten for the purpose of pressing out the air) of a consistency for working. A piece of clay is stuck upon a circular board, which has an horizontal rotation, and a vessel is almost instantaneously formed by the artist; then follows the more perfect operation of the work, the processes of colouring, glazing, painting and stamping; the drying or baking kilns complete the work."—This little Guide may be consulted with advantage by those who wish for information relating to Swansea; and points out candidly and honestly all those objects in the county of Glamorgan, which an antiquary or tourist would most probably enquire for.

ART. IX. *The Gloucester New Guide; containing an Account of every Thing worthy of Observation, respecting the City, its History, antient and modern Trade, Buildings, and particularly the Cathedral; together with a Directory of the principal Gentlemen and Tradesmen in the City and its Environs; also the different Routes and Roads through the County; with Observations intended to amuse and inform the Traveller.* 12mo. pp. 138.

LOCAL guides of this description, when written by well-informed liberal minded residents, are not only pleasant and engaging to the curious traveller, but prove very useful auxiliaries to general topography. These little *vade mecum*s have usually been made up by some illiterate printer, and consequently have been unworthy the perusal, or criticism of the veteran antiquary. Many of the English cities and towns have "guides" of this description; but scarcely any have been honoured with a learned, local historian. Dydes's liberal and ingenious History of Tewkesbury, Warner's History of Bath, Coates's circumstantial History of Reading, and the present little manual, are interesting exceptions. The latter, though printed anonymously, is, we are assured, the production of the Rev. Mr. Rudge, a respectable clergyman of the city, who has announced for publication a History of Gloucestershire.

In an advertisement to this Guide, the author gives the following very modest account of his book. "The following pages being designed principally to point out to the hasty traveller such things and places in Gloucester and its neighbourhood, as are most deserving notice; the reader will not expect to find all that an antiquary would enquire after, or a minute investigation of events which occurred in periods far remote from present times. The editor only means to bring forward to immediate view the most prominent features, among which he ranks the cathedral." In the description of this noble and interesting structure he has borrowed liberally from the preceding histories by Bonner and Dalaway; and we are sorry to observe, that he has not improved much on his precursors; yet he apologizes for his "prolix" account of the cathedral. This was totally unnecessary; for we are per-

suaded that a full and circumstantial description of this grand pile would be highly interesting to most readers in the closet, and to almost every visitor. This cathedral presents a singular and curious series of architectural examples, wherein are combined different styles that characterised different periods of the art. Hence a particular exemplification would be highly gratifying and interesting.

Our author, however, is not very assuming, for he acknowledges at the end of the advertisement, that he "puts in very little claim to originality; he has made free with whatever authors came in his way, and selected from them whatever suited his purpose. He flatters himself that he has added something to the original stock, but in doing it he has not sacrificed truth to an affectation of novelty. He has lopped off many redundancies without omitting any thing material. In short, he is not without the hope, that the Gloucester New Guide

will supply, even to the native, some information he was not in possession of before, and relieve the traveller from a considerable portion of that tedium, which usually accompanies a temporary residence at the hotel."

The subjects of this Guide are:—*very concise* accounts of the situation and antient state of the city; its present and antient trade, wherein is a *short* account of the pin manufactory; the present state and government of the city; the appearance of its environs; a history and description of the cathedral and its appendages, with the other churches of Gloucester. An account of hospitals, schools, and meeting-houses succeeds, with a few particulars of the other public buildings and offices of the city. Next follow some memorandums of the gentlemen's seats in the vicinity, and an interesting description of the river Severn, its navigation and fishery.

ART. X. *The History and Antiquities of the County of Dorset: compiled from the best and most antient Historians, Inquisitiones post mortum, and other valuable Records and MSS. in the public Offices, and Libraries, and in private Hands. With a Copy of Domesday Book, and the Inquisitio Gheldi for the County: interspersed with some remarkable Particulars of Natural History; and adorned with a correct Map of the County, and Views of the Antiquities and Seats of the Nobility, Gentry, &c. By JOHN HUTCHINS, M. A. The second Edition, corrected, augmented, and improved. In 3 Vols. folio. Vol. II. pp. 620.*

IN the year 1774 Mr. Hutchins, who was a native of Dorsetshire, and rector of a parish in Wareham, published a History of that County in two folio volumes. That "being out of print," and consequently rather scarce, Mr. Gough undertook to edit another edition, two volumes of which are now published; and as the editor informs us, are "corrected, augmented, and improved." The first volume was published in 1796, and the second in 1803. If another seven years elapse before the concluding volume is made public, we presume that many gentlemen of the county will reprobate its tardy progress. In one of the volumes we expected to meet with an advertisement or preface, but this very necessary explanation is withheld till the conclusion of the work, when the editor promises to give "a map of the county, a preface, and the life of the author, with some additions to the letter-press, &c." Without this preface we cannot easily enter into an investigation or history of these volumes, not knowing the respective portions of each editor. We must

therefore content ourselves (for the present) with a concise analysis of the introduction, and a few remarks.

The first volume commences at p. xxi, with an essay called an "Introduction," which continues to page cxii. This contains some dissertations on the etymology and ancient history of the county, its boundary, first inhabitants, and antient monuments. Among the latter are enumerated the Roman camps, roads, and barrows; but in describing these relics of antiquity we find the same confusion of ideas, and of objects that characterise the writings of Doctor Stukeley, whose work on Stonehenge is frequently quoted and referred to. Many of the encampments called and described as Roman, may with equal propriety be ascribed to any other warlike tribe who possessed this part of the country. On this subject, with that of barrows, and what the author calls druidical remains, we find the descriptions and opinions very unsatisfactory and trite. With antient authors and their works the editors are much better acquainted, and we peruse

with satisfaction and pleasure their accounts of Richard of Cirencester, of Antoninus, of Ptolemy, and the anonymous Ravennas. The writings and literary characters of these authors are ably discriminated, and those parts of each that particularly relate to Dorsetshire are critically examined.

Under the head of "Ecclesiastical History," is given a concise and well-written account of the introduction and establishment of christianity in this country; and its influence in Dorsetshire is manifested by the foundation of churches, the erection of bishopricks, and by the effects produced on the inhabitants. The next division of the work refers to the civil history of the county, and includes a history and lists of sheriffs, from the beginning of Henry the second to the time of publishing the first volume. Tedious lists of all the civil officers of the county follow, and these are succeeded by "some observations on the maritime affairs, on beacons, the population, a list of market towns, seats, public and civil buildings, &c." The natural History of Dorsetshire is but slightly touched on. This very interesting branch of topography was scarcely noticed by many of our former county-historians; and some of the present day either totally neglect it, or treat it so very superficially, that their dissertations prove more detrimental than beneficial to the subject. A long account of the agriculture, &c. of the county is extracted from Claridge's report, and the introduction closes with an essay on coins, or provincial tokens, which we think almost unworthy of no-

tice in the history of a county. In describing Dorsetshire the author has divided it into districts and hundreds, and subdivided these again into parishes, manors, hamlets, tithings, &c. Each of these furnishes matter for a separate history, and, as is commonly the case in similar works, the reader is obliged to labour through a vast mass of uninteresting, dull narrative, for the purpose of catching a few glances of curious or engaging information. It has not been the fortunate lot of many county historians to excite much interest in their works, or render them amusing and attractive to the general reader, to foreigners, and such persons as wish to be acquainted with the local history and topography of our island. To effect this we know is no easy task, but we believe it to be attainable, and hope that some men of genius, talent, and science, will exert their powers to rescue this branch of literature from the opprobrium of soporific dulness and insipidity, which it has long laboured under. As the work is very incomplete we suspend our final opinion on its general character and execution, and delay any further account of its contents, till the third volume is published. It may however be proper to observe, that the volumes are printed on three or four different sorts of paper, which gives them a disreputable appearance; and the plates are more diversified than the paper. Some of them are tolerably executed in their drawing and engraving, but the greater part are insignificant and bad.

ART. XI. *The History of Cornwall, civil, religious, architectural, agricultural, commercial, biographical, and miscellaneous.* By the Rev. R. POLWHELE. Vols. I. and II. 4to. pp. 436, in both volumes.

WE presume that the writings and literary character of Mr. Polwhele are well known to most of our readers. He has long laboured in the literary vineyard, and though we cannot compliment him on the success, or felicity of his topographical publications, yet his industry and general talents will ever demand our respect. Some of his poetical writings are highly honourable to his feelings and fancy; and in the poem of the "Old English Gentleman," we are delighted with the judicious discrimination of character, and with the nice delineation of manners and customs which were formerly the pride and

boast of Englishmen: but if we critically examine his *fragments* towards a history of Devonshire, and these first volumes of a history of Cornwall, we discover too much of the poet in the historian, and too much of the theorist in the antiquary. Having said thus much of Mr. Polwhele's literary character, we proceed to lay before our readers the leading features of these two volumes of the history of Cornwall, reserving our decisive opinions on the work till the next time we meet him in our annual journey.

The first volume commences with a dedication to the prince of Wales, where

in the author acknowledges, that in the execution of his extensive plan, he is "conscious there are great defects. But as this plan is chronological, it may be justly deemed an outline to be improved hereafter, as opportunity may offer, and to be continued through future times."

This chronological plan of Mr. Polwhele's is certainly very different from that of any other county historian, but we fear this difference will not obtain it much pre-eminence: for though we approve of some parts, yet we must decidedly reprove others, and particularly its execution. The labour of searching after the various memoranda relating to one place is endless, and the long quotations, and frequency of repetition, become extremely tiresome. Thus, in narrating the history and description of a certain ancient town, castle, &c. we find some particulars, or rather dissertations, on it, under the British period; again, in a subsequent part of the volume, under the head of civil and military transactions of the Romans; some of this is again repeated with unconnected scraps, under the respective dynasties of the Saxons, Danes, Normans, &c. And if the author completes a parochial history of the county, most of them must be again related, or his readers will have the painful task of referring to several distant parts of the book to obtain the particular history of a single place. The plan thus marked out by our ingenious author is subject to many objections; and for a county history of local information and reference, cannot obtain the suffrage of topographers and antiquaries. But these are not our only objections to Mr. Polwhele's history: his manner of surcharging it with long, inapposite extracts from other printed books; his predilection for theory and dissertation; his ready acquiescence in and vindication of the reveries of Borlase; his very bad prints, &c. are all defects in his work, and such as become doubly reprehensible in a man of genius and talent.

The first book of his work is occupied with dissertations on the civil and military transactions which relate to Cornwall, from the time of Julius Cæsar to Vortigern. Of this period we have scarcely any records, and therefore Mr. Polwhele acknowledges he must be contented to connect "a few scattered facts by the links of probability." This is admissible occasionally, but it should

be adopted with great caution. In a subsequent part of the work, the author observes, that "*tradition will often throw great light on the obscurity of history. Tradition, with no presumptive proofs from history to precede it, is little to be regarded. If we allow it to lead the way, it is ever a fallacious guide: but when we can introduce it as an auxiliary, its claims are certainly to be heard.*" An instance of Mr. Polwhele's ready admission of tradition occurs in the following narrative: "There is a strong tradition in the parish of Bishop's Lydiard, that lies under the Quantock-hills, relating to a *Roman* battle. On a farm in this parish (say the country people) was fought the last battle between the Western Britons and their enemies of Rome. The former were totally defeated, and the farm has ever since been called *Conquest Farm*. The tenant is ready to point out to enquirers the *very situation of the armies*: and near the fatal spot is a circular camp, of about twenty acres. This surely is remarkable; and *here* I can readily see the spot where Vespasian routed the Britons before he proceeded on his march towards Exeter."

The second chapter applies to the geography of Danmonium, and the original government of its inhabitants, with some account of their civil and military constitution.

"With respect to the geography of Danmonium," observes Mr. Polwhele, "I shall quote the descriptions of Ptolemy and Richard, as far as they relate to the western part of the island. Ptolemy of Alexandria, who flourished under the emperors Trajan, Hadrian, and Antoninus Pius, is one of the most ancient geographers, whose works are extant. It may be proper to premise, that there are two general errors in Ptolemy, which affect the whole geography of Britain: this writer has made all England decline from the true position as to the length of it, and entirely changed the position of Scotland, representing its length from east to west, instead of from south to north; and he has placed the whole of South Britain too far north by two or three degrees."

The inaccuracy of all ancient maps of Britain is not at all surprising, when we recollect the relative state of society and science; but we are surprised that modern writers place so much dependence on their authority, and the position

of places, &c. marked on them. The above errors of Ptolemy are not his only geographical defects: Baron Clark considered him among the most incorrect of all ancient authors; and Mr. Horsley has demonstrated his inaccuracy by giving another more rectified map of Britain, from a comparison with which the futility of the former becomes more apparent. Knowing this, and similar instances in later accounts and more recent maps, we cannot too strongly recommend to topographers and antiquaries, the necessity of visiting and examining places and things. Had Mr. Polwhele been more attentive to this part of a topographer's duty, we should have felt more satisfied with his descriptions and inferences; but observing his ready acquiescence in other's opinions, and his copious quotations from Borlase, Hals, Tonkin, and other speculatists, we follow him with great caution, and suspect many of his deductions. In the following quotation, this will be clearly exemplified:—"Pryce," Mr. Polwhele observes, "states, that '*Redruth--Dredruth--* signifies the *Druid's town*.' And of this he is assured, 'from its vicinity to *Karnbre*, that celebrated station of druidical superstition, where are to be seen a *multifarious collection of monumental druidism*.'" Before we proceed with this extract, it may be necessary to inform the reader, that Mr. Pryce was an apothecary of *Redruth*, and having, like his countryman Borlase, amused himself with reveries on druidism, at last fancied every heap of stones a druidical monument, and *Karnbre*, which is a large granite hill covered with detached masses of rock, he hyperbolically pronounces, "a multifarious collection of monumental druidism." Mr. Polwhele, imbibing a little of his predecessor's spirit, remarks on this passage.

"At all events, there is *no doubt* but *Redruth*, in the vicinity of *Karnbre*, was one of the chief towns of the druids of *Danmonium*; and at *Plas-an-guere*, in *Redruth*, there were very lately the remains of an amphitheatre. This is evident from the very name. But the amphitheatres of *St. Just* and *St. Piran*, bear evident marks of the judicial court in this canton of the *Carnabii*. The amphitheatre of *St. Just*, in the hundred of *Penwith*, situated near the church, is somewhat disfigured by the injudicious repairs of late years; but by the remains it seems to have been a work of *more than usual labour and correctness*. It was an exact circle of 126 feet diameter. The per-

pendicular height of the bank, from the area within, is now seven feet; but the height from the bottom of the ditch without, at present ten feet, was formerly more. The seats consist of six steps, fourteen inches wide, and one foot high, with one on the top of all, where the rampart is about seven feet wide. That plays were acted here, I have not a doubt: but I concur with Mr. Whitaker in thinking that these circles were designed for British courts of judicature."

From the tenor of this extract, a reader would conclude it was dictated from personal inspection, and that "the amphitheatre" is now in the state described by the author: but upon referring to Borlase's account of it, we find *the same words* adopted. Had Mr. Polwhele acknowledged his authority, we should have been satisfied with *him*, though perhaps not equally so with the original author. From the description of a correspondent in Cornwall, we learn that the monument above described is merely "a simple raised bank, or valium, running round a flat area. The bank has *no indication of seats or steps*, nor is there the least appearance of *repair*." In describing many encampments, cromlechs, circles, &c. we observe a similar practice in our author; and as the practice conduces to perpetuate and propagate falshood, and tends to depreciate liberal antiquarianism, we must discountenance and reprove such conduct.

In the third chapter Mr. Polwhele takes a review of the religion of the *Danmonians*, as influenced by druidism, by Roman paganism, and by christianity. Among the objects of religious veneration of the pagan Cornish, the serpent was, according to our author, the most pre-eminent. "To the famous anguinum they attributed high virtues. The anguinum, or serpent's egg, was a congeries of small snakes rolled together, and incrustated with a shell, formed by the saliva, or viscous gum, or froth of the mother serpent. This egg, it seems, was tossed into the air by the hissings of its dam; and, before it fell again to the earth (where it would be defiled) it was to be received in the sagus, a sacred vestment. The person who caught the egg was to make his escape on horseback; since the serpent pursued the ravisher of its young, even to the brink of the next river. Pliny, from whom this account is taken, proceeds with an enumeration of other absurdities relating to the anguinum."

What will naturalists say to this ridi-

culous story, but that the inventor and relator of it ought to be classed with the species of animals denominated—*Naturals*.

The fourth chapter embraces what our author calls a review of "the civil, military, and religious architecture of Danmonium;" in which he has included some long digressions on the Roman roads, stations, and camps in Devonshire and Cornwall. This volume, though entitled a history of the latter county, may be considered almost equally a history of the former; as its principal historical dissertations apply equally to both. It is certainly no easy task to separate the two in their early historical relations; but as Mr. Polwhele has already written largely on "the historical views of Devonshire," he should rather have taxed his own exertion and patience than that of his readers, in separating the two.

The remainder of the first volume is appropriated to the subjects of "woodland, pasturage, agriculture, and gardens: to mining, manufactures, and commerce: to language, literature, and learned men: to population, manners, and usages." These latter subjects are treated in a very concise manner; and the volume is terminated with twenty-three prints of monuments, antiquities, views, &c. Some of them are copied from Borlase's very inaccurate prints, and the others are so very indifferent, that they rather disfigure than ornament the book they accompany.

The first volume professes to embrace all historical subjects included in the period from Julius Cæsar to Vortigern; and in the second part the same subjects are reviewed in their progress and improvement, from Vortigern to Edward the First. This portion of the work becomes more interesting than the former, as it is founded more on the evidence of fact and record; yet the first part of it is much depreciated with the fables of the renowned Arthur, and some other British champions. The ravages and piracies of the Danes are particularly detailed. Long genealogies of some Cornish families, with accounts of the princes and dukes of Cornwall, occupy many pages. The notes, which are numerous, and very copious, are

printed in small letter, and in many instances fill whole quarto pages: but as they are generally extracts from other publications, they do not occupy much of the author's thinking time.

With the following extracts, descriptive and historical, of St. Michael's mount, we take leave of these volumes and our author for the present.

"St. Michael's mount is one of those rare and commanding objects which arrest and fix the attention the moment they are seen. Its peculiar situation, and the sublime character it assumes, from appearing to rise immediately from the waves, singularly interest the imagination of the observer; though when viewed from the land, its real magnitude is apparently diminished, from the vast extent of the horizon and the expanded tract of water which surrounds its base. 'It is a scene (says Mr. Britton\*) singularly calculated to inflame the enthusiasm of the poet; and a mind of no common mould has thus poured the note of sublimity from the vocal shell, on contemplating the beauty of the prospect, and revolving the events which the traditional lore of past ages represents to have occurred on this spot.'

"Majestic Michael rises: he whose brow  
Is crowned with castles, and whose rocky  
sides  
Are clad with dusky ivy; he whose base,  
Beat by the storms of ages, stands unmoved  
Amidst the wreck of things;—the change of  
time.  
That base, encircled by the azure waves,  
Was once with verdure clad: the towering  
oaks  
Here wav'd their branches green; the sacred  
oaks  
Whose awful shades among, the Druids  
stray'd,  
To cut the hallowed mistletoe, and hold  
High converse with their gods."

*H. Davy's MOUNTS BAY."*

Another poet of genius has also characterized the mount in the following terms.

"Mountain, the curious muse might love  
to gaze  
On the dim record of thy early days;  
Oft fancying that she heard, like the low  
blast,  
The sounds of mighty generations past.  
Here the Phœnician, as remote he sail'd,  
Along the unknown coast, exulting hail'd;  
And when he saw thy rocky point aspire,  
'Thought on his native shores of Aradus and  
Tyre,—

\* By a subsequent part of this extract, it appears to be taken from 'The Beauties of England and Wales,' a work which bears the joint names of Messrs. Britton and Brayley, and therefore Mr. Polwhele should have mentioned *both* names, or *neither*.

Thou only, aged mountain, dost remain,  
Stern monument amidst the delug'd plain:  
And fruitless the big waves thy bulwarks  
beat;  
The big waves slow retire, and murmur at  
thy feet.'

Rev. W. H. Bowles.

"The first of these extracts has reference to the popular belief of St. Michael's mount having, in the remote ages of antiquity, been situated in a wood; a circumstance to which its name in the Cornish language gives a considerable degree of plausibility. This tradition is partly confirmed by the testimony of Leland, who remarks that 'In the baye betwixt the mont and Pensants, be found nere the lowe water marke, rootes of trees yn dyvers places.' And Borlase, in a paper published in the fiftieth volume of the Philosophical Transactions, strengthens the evidence, by relating the discovery of the roots and trunks of trees; some of them embedded in the natural soil, but covered with sand, and submerged by twelve feet of water every flowing tide. Ptolomy calls the mount *Ocrinum*; but soon after the sixth century, it seems to have received its

present name, from the apparition of St. Michael, whose appearance, according to the monkish legends, to some hermits on this mount, occasioned the foundation of the monastery. The place where the vision sat was a craggy spot, in a dangerous situation, near the upper part of the rock, which in the time of Carew, bore the name of *St. Michael's chair*; but that appellation has since been transferred to a more accessible, but equally dangerous, spot, on the summit of one of the angles of the chapel tower. Though little credit can be attached to this wild tale, yet it is certain that the mount became hallowed at a very early period; that it was renowned for its sanctity, and was for a time an object of frequent pilgrimage. The superstition paid to it by the mistakenly devout, is alluded to by Spenser in his *Shepherd's Calendar*, and in terms sufficiently explicit to mark its fame.

'In evil hour thou lenst an hond  
Those holy hills to blame,  
For sacred unto saints they stond  
And of them have their name:  
St. Michael's mount who does not know,  
That wardes the western coast?'

ART. XII. *A Companion and useful Guide to the Beauties in the Western Highlands of Scotland, and in the Hebrides: To which is added, a Description of Part of the main Land of Scotland, and of the Isles of Mull, Ulva, Staffa, I-Columbkil, Tirii, Coll, Eigg, Skye, Raza, and Scalpa. By the Honourable Mrs. MURRAY, of Kensington. Vol. II. 8vo. pp. 436.*

In the year 1799, Mrs. Murray published an octavo volume, as a "Guide to the Scottish Scenery," &c. That having met with some success, and been spoken highly of by two or three reviewers, she has extended the work by publishing the present volume, which refers principally to the scenery and character of the western islands of Scotland. These wild and interesting regions had previously attracted the curiosity of Dr. Johnson, Dr. Garnett, Faujas St. Fond, &c. each of whom has communicated his observations to the public. The opinions of the first tourist are replete with prejudice, whilst those of the two latter gentlemen, though not so generally known, are much more scientific and important.

The work is humbly entitled, "a Companion and useful Guide," &c. and the first part is simply occupied with directions about inns, roads, travelling and accommodations; all these are required to be known by persons making the tour, and a knowledge of them must facilitate their progress, and add to their comfort. "This Guide," observes Mrs. Murray, "points out to the traveller

what is worth noticing in his tour, with the distances from place to place; mentions the inns on the road, whether good or bad; also, what state the roads are in; and informs him of those fit for a carriage, and those where it cannot go with safety. In these respects, the present work differs from any other publication of the kind; for no writer of tours has hitherto taken the trouble of ascertaining what may be seen worthy of notice in the course of a travelling journey; and it very often happens, that he passes within a mile or less of very great natural beauties, without either knowing or having heard of them; and the country people seldom or ever name to strangers what they think nothing of, because seeing them every day they regard them not as objects of curiosity."

These are facts well known, and often lamented by the curious traveller, who loses the sight of many singular and interesting objects, for want of knowing their true situation and real character. A faithful guide is therefore a valuable travelling companion, and such we believe is this before us.

The first part of the volume contains

a simple guide or directory to Edinburgh, to the beauties in the western highlands, to the isles of Staffa, I-Columbkille or I-Ona, Mull, Ulva, Tirii, Coll, Eigg, Rum, Canna, Skye, Raza, and Scalpa; and in the main land, through glen Elg to fort Augustus; also, to a part of the eastern coast of Scotland, Braemar and Rothiemurchus. In the second part these places are described, and various intermediate objects and circumstances descanted on. Some of the relations are extremely interesting, and our sympathy and curiosity are held in continued suspense. We feel for the situation of the tourist; and contemplate, in imagination, the various incidents of her journey, and also the wild scenery of the country she passed through. As many of the narratives are peculiarly interesting, we intend to make two or three long extracts, for the gratification of our readers.

The first we select will be an account of her excursion through the island of Mull. This will at once characterise the style of descriptive writing, and the ardor of mind displayed in our female tourist.

"On the 31st of July, 1800, I set off from Ach-naCraig, for a ride of forty miles, from one extremity of Mull to the other, through the heart of the island.

"The reverend minister's house, for which I was bound, is about thirty-four miles from Ach-naCraig, and six or seven miles short of the point of Ross, the land's-end of Mull.

"I was informed that there was a gentleman's house in the way, at about twenty-four miles from Ach-naCraig; so that, if I could not reach my friend's habitation, I flattered myself, from the well known hospitality of the country, that I should not be in any great distress. Fortunately for me, the day continued wonderfully fine to the end of it.

"The cavalcade set forward exactly in the same style it left Aros for Torloisk\*, and I immediately began to mount a very steep hill, in a terrible rough track. Over the summit, and down its precipitous side, to one of the heads of Loch Spelibh (sounded Spelive,) there is no track at all, and I was continually fancying I should be thrown over the head of the horse, down a rocky high bank, bounding a roaring stony bedded burn, close over which the guide was leading me. Before me

were lofty mountains, and deep glens between them, which attracted my notice; and my fears were lessened by my admiration of the sublime scenery towards one of those mountains, the name of which Dugall, my leader, told me was Ben Buy; and he continued in his broken English to relate the legendary history of other days, concerning that and its neighbouring hills."

Some of these legends relate, that the mountains and glens of this district were inhabited by a race of giants, whose battles and wonderful exploits are the theme of "many a gossip's tale;" and Mrs. Murray's guide, Dugall, informs her of the extent and character of these traditions. With the relation of these superstitious stories, the time is beguiled till they arrive at Loch Spelibh, where the ground is boggy, dreary, and wild, though the sides of the lake are covered with woods.

"On leaving Loch Spelibh," continues Mrs. Murray, "I followed a river running to it out of Glenmore, and soon entered that glen, and a wilder and more Alpine region cannot be imagined. Some hills are rough and rocky, others green to the very summits of them; particularly one, a higher hill than any in Mull, except Benmore, which stands insulated by narrow glens, and from the bottom to the top of it I never saw finer sheep pasture.

"I journeyed on for many miles through this Alpine scenery, till I came to a diminutive plain, with three tracks from different glens leading to it. I was then riding on the brink of a river, and about two miles before us I observed a terrible steep zig zag track, up an almost perpendicular face of a mountain. That, said Dugall, is our road; and when we came within half a mile of it, we steered our course over a boggy piece of moor, the remembrance of which almost makes me tremble.

"When we arrived at the foot of the zig zag ascent, I got off the horse; had I not done so, I verily believe I and the horse should have fallen back down the precipice, dragging Dugall, the leader, after us. It was one of the hottest days I ever felt, and the labour of scrambling up the steep road amongst loose stones, for two miles, was dreadful. Dugall said it was only one Mull mile, which is fully two measured miles. The people in Mull jocosely say of their miles, that they make up in measure for what their roads want in quality.

\* This she describes in the following terms: "Mrs. Murray appears dressed in a red leather cap, trimmed with brown fur, and a habit of tartan, such as is worn by the 42d regiment of highlanders. She mounts a white horse, with a Fingallian stick in her hand, cut out of the woods in Morven: her horse led by an honest highlander. Then comes a sheltie, with creels (panniers) on his back, containing the baggage, on which sat a highland lad. Thus moved Mrs. Murray's first cavalry expedition in the island of Mull, and laughable enough it was."

"When I reached the summit of the hill, I looked around me, and to my sorrow perceived before me Benmore, in its fair day's glory, with its lofty top piercing the clouds, and at its base Loch-na-keall. I exclaimed, Dugall, we are wrong: how shall we get back again down the dreadful zig zag? Dugall hung his head, and confessed he had never gone the horse tract through Glenmore, but he had often travelled (walked) over the hills to the west side of Mull.

"We kept along the ridge of the hill for another highland mile, and then descended to a glen, in which is a small lake, and a hut or two at the end of it.

"I was rejoiced at the sight of any human trace, and sent the boy to enquire, if the track we were in led to Penny Cross. It did, and we made what speed we could through the rugged glen. We were told by travellers (walkers) whom we soon after met, that if we did not travel very hard, we should not reach Penny Cross by sun-set. We had lost our way once, and were not very clear about that we were pursuing; therefore the intelligence received from the walkers was not very agreeable.

"After going through beds of rivers, and in every imaginable uncouth track, we came within sight of a hut, at which Dugall said, 'eatables might sometimes be procured; but he did not think what we should there find would be worth seeking, particularly as it would delay us, it being somewhat out of our road.'

"Other burns and rough passes were to be surmounted: at last we came to a spot, from which two tracks branched; one, I believe, leads to Moy, at the head of Loch Buy, the other to the head of Loch Scridain. The pass to Moy being in shade, appeared tremendous, amongst lofty black crags. Ours, although in sunshine, was terrific enough. It was along the side of a precipice, (which we had to climb and descend,) worse than the pass, already mentioned, on the bank of Loch-na-keall; and it had no trees or shrubs to cover its coarse terrific nakedness.

"I got off my horse for safety and rest, and sat down on a piece of rock projecting from a lofty range of broken cliffs above and below me, at the foot of which is a wild plain, with a river flowing towards Loch Scridain. I had but a short portion of provisions with me, not foreseeing that I should lose my way, nor knowing Glenmore to be a wilderness of considerable length, through which I was to wander.

"On the pommel of my saddle hung a bag, containing drawing implements, in which I had brought three or four biscuits from Aros. In a small maltogany case, containing hartshorn and lavender drops, and a cure for bruises, I had some wine, also a tumbler glass, spoon, knife and fork. I produced my

slender repast, which required none of the latter articles, and shared it with my guides. The poor beasts were left to nibble what they could find; alas! they looked for grass, and found nothing but stones.

"I walked down the terrific precipice, and advanced, not without doubt whether we were in the right road or not. At length, we came to a few huts, where women came out to gaze at us. I beseeched Dugall to enquire of every human form he met, if we were in the road to Penny Cross. When I heard something like the sound of pshe, (it is,) in answer to Dugall's interrogatory, I was rejoiced, for I began to be very weary, and the sun was fast declining. Notwithstanding my fatigue, the scenery before me of Loch Scridain, and the bold mountains on the back ground of Kilfinachen, pleased me exceedingly. Loch Scridain is sometimes called Loch Leven, from the elms which formerly grew on its banks; but I suppose, now the elms are gone, Scridain may be more applicable to it. In my wearied state, when I arrived at the head of Loch Scridain, how thankful should I have been to the Duke of Argyle, had his grace established an inn there."

The want of inns in this island is particularly regretted by our tourist; who says, that it would be impossible for persons less *enthusiastic* than herself, to "get a view of the numberless curiosities in the isle of Mull; and that most travellers execrate the island as a barren, dreary, dreadful district," though in the interior and southern parts of it there is much "interesting and delightful scenery."

"As I proceeded along the margin of Loch Scridain," continues Mrs. Murray, "the road became very rugged, or perhaps my extreme fatigue made me think it worse than it really was. About two miles before I came to Penny Cross, I rode through the channel of a burn, the bed of which was full of huge stones, brought by torrents from a lofty crag within sight, the hollow sides of which must, in hard rains, exhibit magnificent cascades; but they were not in beauty the day I passed near them, and it was well for me they were not; for had they been

———— "Grumbling,  
And leaping and tumbling,  
And hopping and skipping,  
And foaming and dripping,  
And struggling and toiling,  
And bubbling and boiling,  
And beating and jumping,  
And bellowing and thumping\*,"

I should not have been able to have crossed

"\* Part of an impromptu taken from a book at the inn at Lanark, where those who visit the falls of Clyde insert their names, and observations too, if they please."

the burn, which rises to an enormous height after violent rains.

"At last, on turning a promontory of rock, I saw my long wished for goal, Penny-cross-house. I had no letter of introduction, nor was I known to the family; but I depended on the character of the inhabitants of the country, and rode up to the door of the mansion as boldly as my exhausted strength would permit. I enquired if Mrs. M'Lean was at home. She appeared, and I thus bespoke her charity: 'Madam, my name is Murray. I am a stranger, and in my way to Mr. Campbell's, the minister; but I am so fatigued with a ride of ten hours through Glenmore, that I cannot proceed: will you have the goodness to give me shelter for this night?' 'Madam, your being a stranger is a sufficient reason for me to pay you every attention in my power; I beg you will come in.'

The next morning Mrs. Murray took leave of her hospitable friends, with many thanks, and proceeded to Mr. Campbell's. This journey proved extremely wet, and at the completion of it she was drenched with rain: nor was this the only unpleasant event in the tour; for the road between Penny-cross and Bunniesain, is more dangerous for a horse than any track she had before entered. The following singular occurrence, related as a fact, might be dramatised with very powerful effect by a skilful writer.

"In former times one of the M'Leans of Duart, whose castle (now in ruins) stands on a promontory in Mull, in nearly an opposite direction to the Lady's Rock, married a sister of Argyle. The lady was handsome and amiable, but unhappily she was barren. In those days it was a high crime in the eye of a husband, when his wife bore him no children. Duart hated his hapless lady for that cause, and determined on her destruction. To accomplish it with ease, and, as he imagined, safe from detection, he ordered ruffians to convey her secretly to the bare rock, near Lismore, and there leave her to perish at high tide. The deed was executed to Duart's wish, and the lady left on the rock, watching the rolling tide rising to overwhelm her.—When she had given herself up for a lost being, and expected in a very short time to be washed from the rock by the waves, she fortunately perceived a vessel sailing down the sound of Mull, in the direction of the rock on which she was sitting. Every effort in her power was exerted, and every signal in her possession was displayed, to attract the notice of the people in the vessel. At length they perceived her, and drew near the rock. She made herself known, and related, that it

was by the order of her barbarous husband she was left on the rock, and thus reduced to the wretched state in which they found her. The mariners, ever a generous race, took compassion on her, received her on board their vessel, and conveyed her safely to her brother at Inverary.

"M'Lean Duart made a grand mock funeral, for his much-loved, much-lamented lady, whom he announced to have died suddenly. He wrote disconsolate letters to her relations, particularly to Argyle; and, after a decent time, went to Inverary in deep mourning, where, with the greatest shew of grief, he lamented to his brother-in-law the irreparable loss he had sustained. Argyle said little, but sent for his sister, whose unexpected appearance in life and health, proved an electric shock to her tender husband.—Argyle was a mild and amiable man, and took no other revenge of M'Lean, but commanding him to depart instantly; at the same time advising him to be cautious not to meet his brother Donald, who would certainly take away his life, for having intended to destroy that of his sister. Sir Donald Campbell did meet him many years afterwards, in a street at Edinburgh, and there stabbed him for his crime towards his sister, when M'Lean was eighty years of age."

The succeeding narrative of Mrs. Murray's\* voyage to Staffa, and the description of the island, cannot fail to interest every class of readers; and, we presume, the extent of the extracts will not satiate or fatigue the mind. She left Torloisk in a very small boat, having four rowers, and some provisions in the head of it; also, a young man as an interpreter.—Thus provided, she launched on the Atlantic Ocean. The tide and weather were favourable, and the voyage proved extremely pleasant. At about half-a-mile distant from Staffa, it appeared a very common-looking rough island, or rather a huge rock, with perpendicular cliffs to the summit, rising high above the ocean. "I began to think," says Mrs. Murray, "I had ventured on the Atlantic for a curiosity much exaggerated by my adventurous predecessors; but as I drew nearer to the north point of the island, I soon saw, what cannot be described to be clearly understood by any but those who have had, like me, the happiness of beholding Staffa.

"In the Highlands, local names are very expressive of shape or situation.

"Why Staffa is thus called I cannot say, unless there is any word in the Danish lan-

\* This tourist says, in another part of her volume, that she was the ninth "female stranger who had ventured to Staffa; but none of them had gone valiantly alone as I did."

guage signifying staff or pillar, from which the word Staffa can be derived. Its Gaelic name is Slothfuidh, literally expressing a surf beneath. It seems a mere stretch of the imagination in calling the wonderful cave at Staffa, Fingal's Cave.

"The father of Ossian, in the English translation of his poems, is styled Fingal; in Gaelic, he is called Fhion, or the fair.

"When Fingal's Cave is spoken of in the Erse language, it is called, in the genitive case, Uamh Inn. Fhion's Cave; it bears also another name, Uamh Bhinn, the melodious cave.

"After we had doubled the point of Gometra, the tide turned against us, and the wind in some degree got up, which occasioned waves and hard labour for the rowers; but when we came to Staffa not a breath of wind blew. The sea was as smooth as glass, which enabled the boat to get quite close to the shore, tacking continually amongst innumerable small rocks separate from Staffa, lying on the west side of it. Every length the boat made, new wonders came in view. On the north-west point, rises to a great height a small promontory, almost perpendicular from the sea to its summit. The base of this promontory is rough and irregular for perhaps more than half its height, and where the uneven rock ends, the most beautiful perfect uniform pillars rest upon it, in a convex semi-circle; and were it not for their stupendous appearance, it might be thought that the finest statuary ever existing had stretched his chisel powers beyond human art in forming them.

"Advancing from this beautiful convex circle of pillars, I observed creeks and caves, and perpendicular rocks of great variety; but when I came within sight of the very regular pillars and elevated dome over the great caves, I was in an ecstasy.

"Conceive, if you can, an infinity of small pillars, thrown together in every direction at a very considerable height from the eye, bearing the resemblance of architecture, executed in the most masterly style, and highly beautified by various tints made by time and weather, composing an irregular and continued façade to magnificent domes, from which descend perpendicular, compact, smooth, prismatic pillars, some resting (particularly those at the Boat Cave, and on the west side of Fingal's Cave) on rough, irregular, sound masses of basaltes washed by the sea. Others morticed in the angles of stumps of pillars once entire, the uppermost joints of which have separated from the main mass of pillars forming the island.

"It is said that the Boat Cave is much larger than Fingal's, but it is very little known, owing to ideal or real danger in going into it. The mouth of it is far from striking or beautiful, its form somewhat resembling a barn-door; but the dome or outside roof, resting on the perpendicular prisms, with the symmetry of the pillars, ranged in a com-

pet form all along that part of Staffa, are beyond all description beautiful, even more so, if possible, than the outward parts of Fingal's Cave. But the striking *coup d'œil* of them is lost to all who approach Staffa by the south-east side of it; and it is not seen at all, if the boatmen do not choose to be at the trouble of rowing to the west.

"What is very uncommon, and which gives a very singular beauty to the south part of Staffa, is, that from the commencement of its grand dome or crown, on the west side of it, till near the landing place for cattle on the east side, not a fallen or loose piece of rock or rubbish of any kind is seen.

"I was almost overcome with astonishment and delight, on viewing the parts around the outside of the Boat Cave; and I remained in silent amazement at every succeeding object that met my eye, till I came to the entrance into Fingal's cave, which I did not perceive till I was nearly close to it, occasioned (as we were rowing very near the shore) by a round projection of most beautiful compact prisms, descending from the magnificent crown or dome of small pillars in every direction (beautified as before-mentioned, by the softest mellowest tints that time and weather produce) to a solid rough base of basaltes.

"When I faced the mouth of the cave, what I could see of the inside, and what I gazed at on the outside, made my blood thrill through every vein; but when I got within it I forgot the world and every thing it contains. The omnipotence of the Deity filled my soul. I was lost in wonder, gratitude, and praise. My nerves were so wound up, that the smallest sound distracted me. Never shall I forget the sublime heaven-like sensations with which Fingal's Cave inspired me.

"From the grand works of nature, my mind has often been raised in adoration to the Author of them, and they have been to me the best of sermons; but Staffa produced the highest pitch of solemn, pious, enthusiastic sensations, I ever felt, or ever can feel, in this my house of clay."

"It has not been longer than twenty-eight or twenty-nine years since the island of Staffa has been noticed as an object of curiosity; for, previous to the year 1770, it was avoided rather than sought after. It does not lie in the direct course, going through the sound of I-Colomb-Kill, from the south to the north; nor indeed is it in the way from one island of the Hebrides to another, but stands in the middle of an extensive bay, formed by islands, in the Atlantic, and completely open on the south-west to that ocean; and from that point of the compass Staffa bears the storms and tempests from America, for not a foot of land lies directly between it and that continent. This may be the reason why such heavy seas are commonly around Staffa, and which cause it to be avoided by sea-faring people. —Necessity never obliges any vessel to

steer for Staffa; and as its curiosities were unknown, it was never visited, till within the last thirty years, by any but herdsmen, who probably ran their boats into the creek, where they landed their cattle, and then sailed off again as quickly as possible, without being at the trouble of going either to the south or west sides of the island; or if they did go thither, in all probability they only execrated the useless rocks, and the rough and dangerous sea around them, without conceiving that those billows surrounded the most wonderful productions on the face of the earth, which they had neither sense to feel, nor understanding to comprehend.

“ Dr. Johnson had not the happiness of visiting Staffa. What a loss he sustained! The wonders of that island were very little known at the period he passed near it, in his way from Ulva to I-Ona.

“ Fingal's cave, and Staffa's bending pillars, might have been doomed to waste their beauties in the desert ocean, had they not been brought to light by the account of Staffa published in Mr. Pennant's tour, which was sent him by Mr. (now Sir Joseph) Banks. Mr. Pennant, like Dr. Johnson, did not go near Staffa; he only saw it at a distance, (as I was told), and his draftsman took a view of its general appearance on the east side, where there is the least to be seen.

“ The views in Mr. Pennant's tour (I have been informed) of the Clam-shell and Fingal's cave, are engraven from drawings sent to him by Sir Joseph Banks, with the discoveries he had made at Staffa.

“ The view of the Clam-shell cave, gives a faint idea of the bending pillars around it; but as for Fingal's cave, it is impossible to delineate precisely either its form or solemnity, or give any idea of its beautiful grandeur.

“ Sir Joseph Banks acquired his first knowledge of Staffa from a speculative gentleman from Ireland. In Mull, he went by the name of Leach, but it was thought it was not his real name. His speculation in the Hebrides was farming; and whether by accident or on a new speculation, no matter which, he landed on Staffa. He explored its wonderful caves, and had taste and judgment sufficient to comprehend the value of all he found on that astonishing island. Sir Joseph Banks met Mr. Leach, at Drem, in Morven, from whom he learned what a rare jewel stood unknown and unnoticed in the Atlantic, and offered to accompany him to it; an offer not to be refused by a philosophic mind, the philanthropy of which had carried him round the terrestrial globe.

“ It has been by a few imagined, that the summit of Staffa is supported by pillars resembling a colonnade. A man, not long since (I will not say of what nation) arrived at Lagan Ulva, on purpose to see Staffa, with that imagination full in his mind. He ordered a boat to be ready the next morning to carry him to Staffa; but unfortunately for

him, he made all the enquiries he could concerning the pillars of that island, and when he was assured that he could neither sail nor row between the fine basaltic pillars, which he had been informed (he said) supported Staffa, he in a pet retraced his steps to Aros and Oban, without going thither; for he declared he would not give a straw to see that island, unless he could sail or row through it, under a colonnade of angular pillars.

“ Staffa rises perpendicularly from the sea at every part except at one creek, running some way into the island, on the east side, where few visitors reach; it is there they land what cattle and sheep are grazed on the summit, and it is the most sheltered spot around the island.”

“ There can be no doubt but Staffa is a huge bunch of prismatic pillars, nicely and closely fitting each other in every part, having its high summit covered with soil and grass. The pillars are jointed at unequal distances, and frequently the sections at the joints are concave on one side and convex on the other. This may be plainly seen in the inside of Fingal's cave, by noticing the stumps forming the pavement, and their corresponding parts in the arched roof over them. From this circumstance some imagine the enlargement, if not the whole of this cave to be formed, by the joints near the roof having been loosened, the under parts sunk perpendicularly to an irregular depth; but the most natural cause seems to be, that time, or decomposition of the cement in the fissures of the angles, and between the joints of the pillars, having loosened their hold on the main mass or bunch, the violent surge has carried off the joints, one after another, as the cement which held them together became weakened. Thus, too, must have been formed the pavement on the outside of the cave, with this difference, that in the inside of the summit, joints, and angles have been strong enough to retain their union with their neighbouring pillars, and thereby have formed the roof of the cave. The summit on the outside, exposed to open air, has been too feeble to resist storms, consequently those pillars with the crown and soil summit, have been swept clearly away by the violence of the sea, whenever a decomposition of the cement has taken place.

“ If an uneven transverse slice of a honey-comb were petrified, slightly polished, and of brown colour, it would give a faint idea of the appearance of the pavement within and without Fingal's cave.”

The author next visits and explores that cave, which she attempts to describe; but her feelings of admiration and wonder seem to deprive her of the power of description, for she becomes ambiguous and tautologous. She visits many other parts of the island, and endeavours to delineate its most prominent

features. Some of these sketches are touched with spirit and truth, but others are too faint, or confused, to be easily comprehended. With another short extract we must take leave of our entertaining tourist, whose work has certainly afforded us much amusement. If she intends to publish again, we recommend her (with sentiments of true candour and friendship) to cultivate brevity and perspicuity of description, to study a little of natural history and antiquity, that she may thereby extend her enquiries, and give more interest to her productions.

The Clam-shell cave, with its large bending pillars, convex horizontal prisms, &c. are described, and Mrs. Murray states, that she appropriated this singular spot to "a dining room." "When I had finished my luxuriant feast," she observes, "particularly of mind, I began my march over the horizontal pillars, which lay like numerous keels of huge men of war, petrified in one mass, and jointed like masonry. By scrambling

over some horizontal, some bending, some upright pillars, I at length gained the plain at the summit of the island. This plain is about one mile by three quarters, having a thin strata" (stratum) "of soil over the great caves, but on the north side of the island the pasture is admirable for feeding of cattle and sheep. It will graze from forty to fifty head of cattle from October to June, and heifers for the remainder of the year, giving the grass a month's respite. Staffa when farmed, lets for fourteen pounds a year. It is part of the estate once belonging to Macquarrie, chief of the Macquarries, and whenever it has changed masters, it has been sold with the island of Ulva. The present laird of these isles is Ranald McDonald, Esq. of the house of Boisdale, whose mind and taste are fully capable of appreciating the jewel in his possession, the like of which, in all probability, cannot be found on the face of the terrestrial globe."

ART. XIII. *Ανδρωπλανομενος*; or, a pedestrian Tour through Part of the Highlands of Scotland in 1801. By JOHN BRISTED. Svo. Two Vols. pp. 1160.

OFT have we admired the address of those renowned sons of Galen, Doctors Brodum, Solomon, &c. and the rival dexterity of Mr. Packwood in the variety and originality of their advertisements. One begins a grave paragraph, perhaps on the importance of Malta, the capture of St. Domingo, or the ravages of the yellow fever in Philadelphia; and soon finds oneself assailed with an eulogy on the virtues of the *Balm of Gilead*, the *Vegetable Syrup*, or the new *Razor-strop*. We have laboured through this long advertisement, 1160 pages! in which that "most marvellous effort of human ability and benevolence," Dr. Cowan's *Tractate on Education; the Adviser, or Moral and Literary Tribunal; Essays, philosophical and critical, by the author of the Adviser; and the Wanderer*, are puffed off with no common assiduity.

We shall not detain our readers two minutes; it is not our intention to empty upon their heads the contents of these volumes.

We shall just hint that Mr. Bristed is not ashamed virtually to avow himself the author of *Essays, philosophical and critical*. (See pages 196 and 197, vol. 2.) although in another place (vol. 1. 349,) he speaks of the *Adviser* as having been written by some other person.

Mr. Bristed and his companion travelled through the Highlands in the character of American sailors; they roamed the country in *forma pauperum*, descendant loudly on the luxuries of the great and the miseries of the poor, go from pot-house to pot-house for half a bed, complain of the jealousy of the police because they are taken up for spies, and of the frequent inhospitality of the Scots, because they were not welcomed as gentlemen! There is a great deal of pertness and a great deal of vulgarity in these volumes: it cost Mr. Bristed but very little effort, we suspect, to accommodate his conversation to the company he courted in the Highlands. Mr. Bristed takes every opportunity of communicating his opinion on moral and political subjects, which he generally treats in a very dictatorial manner. About a hundred pages at the latter end of the first volume are taken up in considering the state of the female sex: what relates to their intellectual acquirements, and their state in society, is stolen from an essay in the first volume of the Cabinet (p. 178.) The theft too is committed in a most mean and sneaking manner; in the first place there is no reference given to the original essay; every instance of female superiority there produced is

transplanted here, often with some little additional circumstance to disguise it: even the metaphors and similes there employed are used here, disfigured indeed, grossly disfigured, although the identity is palpable. It would have been

more impudent but less dishonourable to have transcribed the whole essay, or to have copied sentences entire and un-mutilated, than thus wantonly to have defaced them for the pitiful and frustrate purpose of avoiding detection.

ART. XIV. *Scottish Scenery; or, Sketches in Verse, descriptive of Scenes chiefly in the Highlands of Scotland; accompanied by Notes and Illustrations, and ornamented with Engravings, by W. Byrne, F. S. A. from Views painted by G. Walker, F. A. S. E. 4to. pp. 400. 20 Plates.*

Μεγὰ Βέλαιον! We must be allowed to exclaim in Greek, at the sight of this grand volume, "descriptive of the *Petit Tour* of Scotland."

"The author is aware, that of late years, many have been employed in describing the same scenery; yet, as he attempts to treat the subject in a style somewhat different from any traveller who has preceded him, he hopes the design will obtain the approbation of those who have a taste for this species of composition, provided the execution shall be found, in any degree, to correspond with the beauty and grandeur of the subject."

The merits of this author are so various that we know not wherewith to begin. He is poet, moralist, naturalist, philosopher; and though he has modestly withheld his theological knowledge, we see by the title page that he is also a D.D. Of these various subjects the poetry perhaps deserves precedence, as giving title to this mass of multifarious learning, this encyclopædia of human intellect. First, then, we will adduce a few specimens of Doctor Cririe's poetical merits, under the various classes of excellence into which they may be arranged.

First: The Sublime, as produced, in imitation of Milton, by sonorous sounds.

"Here let us stop our wand'ring northward course,  
Nor farther roam mid dreary mountains wild;  
But quick, to where the Tummle meets the Tay,  
To Logie-Rait return. A boat soon wafts  
Us o'er the Tummle." (P. 55.)

"Another river, yet to song unknown,  
The Mouse its name, though small, of mighty force." (P. 144.)

Are we mistaken in supposing that Horace alluded to this river, when he describes the Mouse as proceeding from the mountains?

The Sublime, as produced by the Indefinite.

"Hence westward, hast'ning to the lake  
descends  
A river's mighty stream, Aharan nam'd;  
Sheer o'er the steep it shoots some hundred  
feet." (P. 61.)

Again. Apostrophizing Loch Lomond, for the apostrophe is the favourite figure of passion,

"To thy stupendous size, what's Derwent  
Lake?  
What all the lakes of Cumberland to thee,  
With those that grace her sister county  
join'd?  
Those pretty ponds let others flock to  
view." (P. 108.)

But after this fine passage we perceive with sorrow that the Doctor, deviating from the rules of true sublime, which he had before so well observed, has actually given the measurement of Loch Lomond, bating furlongs and yards. It was peculiarly unfortunate to tell us, that the shores, including their windings, measure an hundred miles in circumference, immediately after the bold apostrophe which we have quoted, and that noble contempt expressed of Derwent-water, for its comparative littleness. The measurement necessarily recalls Guthrie's Geographical Grammar to our recollection, and we feel, what certainly the poet never designed to make us feel, that Lake Superior is indeed a Superior Lake.

The abrupt.

"————— placid and calm  
The twilight dim descends, and changeful  
forms  
Croud the uncertain view, 'mid hills unknown,  
Veil'd with the sable curtains of the sky,  
Which slowly shifting close around. Mean-  
while,  
Fancy, and wild Imagination's pow'r,  
The various forms of lakes and islands trace,
